SLATIN, SIR RUDOLF CARL VON (1857–), Anglo-Austrian soldier and administrator in the Sudan, was born on the 27th of June 1857 at Ober St Veit near Vienna. At the age of seventeen he made his first journey to the Sudan, reaching Khartum by the Nile route in October 1875 in company with Theodor von Heuglin (*q.v.*). Thence he went through Kordofan to Dar Nuba, exploring the mountains of that region. He returned to Khartum in consequence of a revolt of the Arabs against the Egyptian government. There Slatin met Dr Emin (Emin Pasha) and with him purposed visiting General C. G. Gordon at Lado, Gordon at that time being governor of the equatorial provinces. Slatin, however, was obliged to return to Austria without accomplishing his desire, but Emin went to Lado and at Slatin's request recommended the young traveller to Gordon for employment in the Sudan. In 1878, while Slatin was serving as a lieutenant in the crown prince Rudolf's regiment in the Bosnian campaign he received a letter from Gordon inviting him to the Sudan, of which country Gordon had become governor-general. At the close of the campaign Slatin received permission to go to Africa and he arrived at Khartum in January 1879. After a brief period during which he was financial inspector, Slatin was appointed mudir (governor) of Dara, the south-western part of Darfur, a post he held until early in 1881, when he was promoted governor-general of Darfur and given the rank of bey. While administering Dara, Slatin conducted a successful campaign against one of the Darfur princes in revolt, and as governor of Darfur he endeavoured to remedy many abuses. He had soon to meet the rising power of the mahdi Mahommed Ahmed (*q.v.*). Early in 1882 the Arabs in southern Darfur were in revolt. With insufficient resources and no succour from Khartum, Slatin gallantly defended his province. Though victorious in several engagements he lost ground. His followers attributing his non-success to the fact that he was a Christian, Slatin nominally adopted Islam. But all hope of maintaining Egyptian authority vanished with the news of the destruction of Hicks Pasha's army and in December 1883 Slatin surrendered, refusing to make any further sacrifice of life in a hopeless cause. In the camp of the mahdi an attempt was made to use him to induce Gordon to surrender. This failing, Slatin was placed in chains, and on the morning of the 26th of January 1885, an hour or two after the fall of Khartum, the head of Gordon was brought to the camp and shown to the captive. Slatin was kept at Omdurman by the khalifa, being treated alternately with savage cruelty and comparative indulgence. At length, after over eleven years' captivity, he was enabled, through the instrumentality of Sir Reginald (then Major) Wingate of the Egyptian Intelligence Department, to escape, reaching Egypt in March 1895. In a remarkable book, ***Fire and Sword in the Sudan***, written in the same year and issued in English and German in 1896, Slatin gave not only, as stated in the sub-title, "a personal narrative of fighting and serving the dervishes" but a connected account of the Sudan under the rule of the khalifa. Raised to the rank of pasha by the khedive, Slatin received from Queen Victoria the Companionship of the Bath. On the eve of his surrender to the mahdi at Christmas 1883 he had resolved, if he regained his liberty, to use the knowledge he would acquire while in captivity for the eventual benefit of the country, and after a year's rest he took part, as an officer on the staff of the Egyptian army, in the campaigns of 1897–98 which ended in the capture of Omdurman. For his services in these campaigns he was made a K.C.M.G. and in 1899 was ennobled by the emperor of Austria. In 1900 he was appointed Inspector-General of the Sudan, in which capacity his mastery of Arabic and his profound knowledge of the land and peoples proved invaluable in the work of reconstruction undertaken by the Anglo-Egyptian government in that country. In 1907 he was made an honorary major-general in the British army.

SLAUGHTER-HOUSE, or ABATTOIR. In the United Kingdom slaughter-houses are of two kinds, those which belong to individual butchers and those which belong to public authorities; the former are usually called private slaughter-houses, the latter public slaughter-houses.

Private.

Private slaughter-houses in existence in England before the passing of the Public Health Act 1875 were established without licence by the local authority, except in those towns to which the provisions of the Towns Improvement Clauses Act 1847, relating to slaughter-houses, were applied by special Act. By the Act of 1875 these provisions were extended to all urban districts. Subsequently to 1890 urban authorities adopting Part III. of the Public Health (Amendment Act) of that year could license for limited periods of not less than one year all slaughter-houses coming into existence after such adoption. In London, slaughter-houses have been licensed since 1855. Private slaughter-houses are frequently situated at the rear of the shop in which the meat is sold. Each consists of a compartment in which the animals are killed, and in association with this are the pounds in which a few animals can be kept pending slaughter. These buildings are regulated by by-laws made under the Public Health Act by the several urban sanitary authorities. The by-laws usually provide for the floor to be made of jointless paving, to ensure that the earth shall not be fouled in the process of slaughtering; for the walls to be cemented to a certain height above the floor, to provide a surface which can be easily cleaned; for the doors to be of sufficient width to enable cattle to enter the slaughter-house without difficulty; and for the poundage to have floor-space sufficient for each animal. These by-laws also provide for water-supply to the slaughter-house for cleansing, and to the pounds for the use of the animals, for the periodical lime-whiting of the premises, and for the observance of care to prevent the blood escaping into the drains. Private slaughter-houses, especially those which were established without licence, are often in too close proximity to inhabited buildings. In towns in which by-laws are not strictly enforced they are often sources of nuisance. Private slaughter-houses are also objectionable on other grounds. They lead to the driving of cattle through the towns on the way to the slaughter-house, sometimes to the danger of the inhabitants, and they render impossible any systematic inspection of meat. It is in connexion with the increasing demand for such meat-inspection that the objections to private slaughter-houses are most manifested; and hence, in countries in which the law provides for the obligatory inspection of meat, private slaughter-houses are ceasing to exist, and public abattoirs are being substituted for them.

Public slaughter-houses are of great antiquity and owe their beginnings to Roman civilization. In 300 B.C. animals were slaughtered in the open air in the Forum in Rome. *Public.* Later, to meet the convenience of butchers, a house on the river Tiber was given to them for the purposes of their trade. This house had been occupied by a Roman citizen named Macellus. The building appears to have retained his name, and hence the *macellum* of Livy's time subsequently erected in the Forum, which, *inter alia*, is believed to have contained rooms for the slaughter of animals. The rooms actually used for slaughter were *lanienae*, from *laniare*, but the word *macellum* has been preserved in the Italian *macellare*, to slaughter, and in the German *metzgen* or *metzgeln*, and in the English *massacre*.

Public slaughter-houses existed in many large towns of Germany in medieval times under the name of *Kuttelhöfe*; they were mostly situated on the rivers, which provided an ample supply of water, and afforded means for the removal of blood. Some of these *Kuttelhöfe* continued to exist within recent years. No law other than a town law governed their establishment and management. They were owned or controlled by the butchers' corporations or gilds, but all butchers were not members of the gilds; and this appears to have led to a ministerial order in Prussia in 1826, which made it inadmissible to require every butcher to slaughter in them. Shortly after the middle of the 19th century the prevalence of trichinosis compelled a return to the use of public slaughter-houses; and the enactment of laws in 1868 and 1881 in Prussia, and similar laws in other German states, empowered urban authorities to require that all animals killed in towns should be slaughtered in public slaughter-houses. (Schwarz, *Bau, Einrichtung und Betrieb öffentlicher Schlacht- und Viehhöfe*.)

In France, in the 15th and 16th centuries, numerous towns were provided with public slaughter-houses. It was required that they should be used by all persons killing animals the flesh of which was to be sold; but their position and the conditions they created were such as urgently to demand amelioration, and some effort was made in this direction in 1567. It was not, however, until the time of Napoleon I. that it was decided that the atrocious nuisance which these slaughter-houses created should be removed. By decrees passed in 1807 and 1810 public slaughter-houses were required to be provided in all large towns in France, the needs of Paris being determined by a Commission, which recommended the establishment of five abattoirs or public slaughter-houses. In 1838 the requirement that public slaughter-houses should be provided in large centres was extended to all towns in France, and it was further required that the slaughter-houses should be situated at a distance from dwelling-houses.

In 1867 the large abattoir of La Villette was constructed to meet the needs of Paris, two of the five constructed under the decrees of Napoleon being closed. In 1898 the additional abattoir of Vaugirard was opened, and the remainder of the five were closed except Villejuif, which was restricted in its use to the slaughter of horses for human food.

In Belgium public slaughter-houses have been provided in all the large and many of the small towns. In Switzerland there are public slaughter-houses in nearly all places having more than two thousand inhabitants. In Italy a law of 1890 required that public slaughter-houses should be erected in all communities of more than six thousand inhabitants. In Austria a law of 1850 required the provision of such places in all the large and medium-sized towns. In Norway and Sweden a law of 1892 required the provision of public slaughter-houses; but it has only partially been fulfilled. In Denmark there are public slaughter-houses in a few towns, including Copenhagen. In the Netherlands and Rumania a number of public slaughter-houses have been provided. It is in Germany, however, that the greatest progress has been made, and especially in Prussia, where, Professor Ostertag of Berlin states, they have "grown out of the ground" (*Handbuch der Fleischbeschau*); so much so that in 1897 there were 321 public slaughter-houses in the kingdom, 40 of which were provided in the period 1895–1897. A later work (*Les Abattoirs publics*, by J. de Loverdo, H. Martel and Mallet, 1906) gives the number of public slaughter-houses as 839 in Germany, 84 in England, 912 in France and nearly 200 in Austria. In some other countries public slaughter-houses have been provided, but they are of a primitive form.

In England the power to provide public slaughter-houses was given by the Public Health Act 1848 to the local authorities of cities, towns, boroughs, &c., to which the Act was applied by Order; and later, was given to all urban sanitary authorities by section 169 of the Public Health Act 1875. *Regulations.* These authorities have, however, suffered from the disadvantage that they have had no power to control the continuance of private slaughter-houses (except in so far as these were annually licensed), and they have therefore been unable to ensure that the public provision would be used by the butchers. In Ireland and Scotland much the same powers exist; but in Scotland, if the burgh commissioners provide a public slaughter-house, no other slaughter-house can be used. Some English local authorities have obtained in local acts powers similar to those possessed by the burgh commissioners in Scotland. The need for still wider control is, however, manifest. Belfast may be cited as an illustration of a town in which a public slaughter-house has been provided, and in which there are no private slaughter-houses, but which receives a quantity of meat from private slaughter-houses erected beyond the boundaries of the city. The outcome of these difficulties is that the power of local authorities to provide public slaughter-houses has been but sparingly used. There is no law requiring that meat shall be inspected before sale for human food, hence there is no obligation upon butchers to make use of public establishments for the slaughter of their cattle. This, indeed, is the position of some of the Continental slaughter-houses; but the increasing strictness of the laws as to meat-inspection, and especially in requiring that all animals shall be inspected at the time of slaughter, is making the use of public slaughter-houses obligatory. Such a law now exists in Belgium, where it has served as a model to other countries. An Imperial German law of 1900 extends to all parts of that country the same requirement, and enacts that "neat cattle, swine, sheep, goats, horses, and dogs, the meat of which is intended to be used for food for man, shall be subjected to an official inspection both before and after slaughter." Antecedent to that year it was in force in southern Germany, in Brunswick and Saxony, but only in some parts of northern, western and central Germany. A similar law exists in Norway and Sweden, but, as already stated, provision of public slaughter-houses is still meagre; in Austria-Hungary there is a similar requirement, but Ostertag states that the administration is lacking in uniformity; in Italy, he writes, the regulation of meat-inspection having been left to provincial authorities, thorough reform is impossible. In the British colonies advance is being made. New Zealand has a number of public slaughter-houses. The Meat Supervision Act of Victoria empowers the Board of Health to make regulations for ensuring the wholesomeness of meat supplies. Regulations have been made for Melbourne. Cattle are killed in public slaughter-houses and the carcases are stamped, thus showing in which slaughter-house they have been killed.

The planning and construction of public slaughter-houses have been the subject of excellent treatises by German writers, among whom may be mentioned Dr Oscar Schwarz, of Stolp, and Herr Osthoff, a former city architect of Berlin, to whose works the writer of this article is largely indebted *Construction.* for information. After inspection of the public slaughter-houses in England and in a number of Continental cities, the writer considers that those of Germany are most deserving of description.

The slaughter-house should be situated outside the town, or so placed as to be isolated, and approached by wide roads, so that if cattle are driven through them there should not be interference with the traffic. If possible, the slaughter-house should be connected with the railway system by a branch line, with a platform which has an impervious surface capable of being readily cleansed and disinfected. The most convenient shape of the site is a rectangle or square, having one side abutting on the principal road and another side bounded by the railway. A cattle-market is usually provided in connexion with the slaughter-house, and the position should be such that cattle brought by train can be taken immediately into the cattle-market and from the market or the railway to the slaughter-house. The cattle-market should be entirely separate from the slaughter-house area. Osthoff states (*Schlachthöfe für kleine und mittelgrosse Städte*) that the area of the slaughter-house should be as follows:—

		Sq. Metres.
Towns of 5,000– 7,000 inhabitants	.	0·40 per inhabitant.
,, 7,000–10,000 ,,	.	0·35 ,, ,,
,, 10,000–50,000 ,,	.	0·30 ,, ,,
,, over 50,000 ,,	.	0·25 ,, ,,

It is of course assumed that the population derives the whole of its meat-supply from this source.

The parts required, according to Dr Oscar Schwarz, are: (1) an administrative block; (2) a slaughtering-hall, with a special room for scalding swine; (3) cattle lairs; (4) room for scalding and cleansing tripe and intestines; (5) an engine-house; (6) separate slaughtering-room, with lairs for animals suffering from, or suspected to be suffering from, contagious disease.

In small towns the slaughtering-hall and room for cleansing intestines may, to save cost of construction, be under the same roof. A necessary adjunct is a cold chamber, to which carcases can be removed from the slaughtering-hall. The actual slaughtering compartment has been built on two plans—one providing a separate slaughtering-room for each butcher, the other a common slaughtering-hall. The latter is greatly to be preferred, inasmuch as it is the only arrangement which gives adequate opportunity for inspection by the officials whose duty it is to examine the meat. The slaughter-house in Berlin was constructed on the separate-room system; but the system gave rise to difficulties of inspection. During recent years in Germany the practice has been to construct slaughter-houses with common halls. The part occupied by each butcher at the time of slaughtering is, however, sufficiently distinguishable, and at Hamburg the position of the hooks hanging from above divides the hall into separate areas, each of which has an entrance from without. Schwarz gives the following as the most convenient arrangement of the buildings: The administrative building (with the house of the superintendent) at the entrance, so that from it the entrance and whole place can be seen. In the vicinity should be a weighing-machine for cattle. The centre of the area is occupied by the slaughtering-halls, and the lairs belonging to them are only separated from them by a road or passage way. The manure-house and tripe-house must be easily accessible from all the slaughtering-halls, but not in direct communication with them, or smell from them may enter the hall.

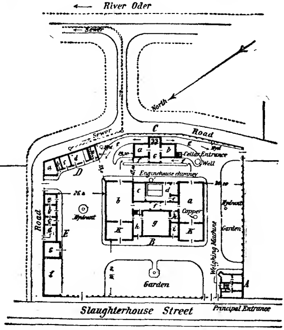
The manure-house must abut upon a road, to enable its contents to be removed without passing through the premises. Next to the tripe and pig-scalding houses is the engine-house. The building for diseased animals, with the slaughter-house for them, must be isolated from all other buildings. All buildings should be so arranged that they may be capable of extension as the population of the town increases. By the provision of grass plots and trees every effort should be made to relieve the premises of the dreary appearance they will otherwise present.

Cold chambers, although not included among the absolute essentials for small slaughter-houses, are an almost necessary adjunct, for they serve for the preservation of the meat after slaughter, and are indeed absolutely necessary when the slaughter-house is of large size. The cold chamber should be situated opposite the slaughtering-halls, so that carcases can be conveyed by overhead carriers directly from these halls to it. Within the cold chamber are separate compartments or cages of different sizes, rented by butchers, who are thus able to preserve their meat and draw upon their supply as their business may require. The cold chamber is therefore a great convenience to the butchers, and is a source of profit to the authority owning the slaughter-house. A frequent adjunct to large German slaughter-houses is the "Freibank," at which is sold at low price cooked meat of quality which renders it unfit to be sold under ordinary conditions.

Much depends upon the design and details of construction of the several component parts of a public slaughter-house, upon the provision of adequate lighting and ventilation of the buildings, upon the construction of walls, floors, and fittings which are impermeable and can be readily cleansed, and upon the provision of an abundant water-supply. It is essential that the buildings should be well lighted, especially those which are used for the slaughtering operations, or for any detailed examination of meat which may be needed—such, for instance, as for trichinae. The material generally used for the floor of the slaughtering-hall is cement or granolithic pavement, which must not present so smooth a surface as to be slippery. The floor must have an adequate fall, so that the washings may discharge into a system of drainage.

The plans of the public slaughter-house of Neusalz on the Oder and of Düsseldorf well illustrate the provision which is now made respectively for a small and for a large town. The writer is indebted to Dr Schwarz for the plan and a description of the slaughter-house at Neusalz. It was completed in October 1899, and is erected on the Oder below the town, on land of an area of 8500 square metres. The building was carefully planned by the town architect, Herr Brannaschk, so as to admit of increase within the next 10-20 years. Brickwork is used for the construction of the buildings, and the roofs are of wood and cement. The walls of all the rooms except those of the administrative block are lined partly with polished stone, partly with cement, to a height of two metres above the floor. The floors consist of stone slabs set in cement (fig. 1).

The administrative block (*A*) is situated at the entrance and is a three-storey building, containing an office, a room for examination of meat for trichinae, and dwelling-rooms for the superintendent. In the central block (*B*) two slaughter-halls are provided (*a*) for swine and (*b*) for cattle and sheep. With these are associated (*c*) an engine-house, (*d*) a boiler and fuel room, (*e*) a workshop, (*f*) a passage communicating with the two slaughter-halls, (*g*) a cold chamber, (*h*) ante-rooms to the cold chamber, (*i*) dressing-rooms for assistants, and (*k*) stabling. The cold chamber has an area of 169 square metres and contains 28 cells of various sizes. In order to attain an even temperature of 2° C. to 4° C., air rendered cold by



The figures give measurements in metres.

FIG. 1.—Plan of Public Slaughter-house at Neusalz on the Oder (1899).

the ammonia process is conveyed to the room by channels. In the engine-house (*c*) are a 48-horse-power engine, the cooling machines, and the water-pump, which pumps water from a well into two cisterns situated in a water-tower over the passage between the two slaughter-halls. In the outbuilding (*C*) are (*a*) and (*b*) the gut-washing rooms for cattle and swine respectively, (*c*) an ante-room with (*d*) openings for manure to be thrown into carts. The road (*e*) slopes downwards, so as to enable a cart to be driven below the openings through which the manure is discharged. In the outbuilding (*D*) are (*a*) a horse slaughtering-room, (*b*) a stable, (*c*) a bathroom, (*d*) a room in which the floor washings are treated chemically or by filtration before discharge into the river, and (*e*) a urinal. In the outbuilding (*E*) are (*a*) a stable for sick animals, (*b*) a slaughter-house for diseased animals, (*c*) a sterilizing-room for meat to be subsequently sold in (*d*) the "Freibank," (*e*) a stable for horses, and (*f*) a cart-shed. The slaughter-house is lighted with electric light. The cost of the buildings is about £19,000, and provides for a population of 20,000 to 25,000 inhabitants.

The slaughter-house at Düsseldorf is on a more extensive scale. It was erected at an estimated cost of from £162,000 to £175,000, and covers an area of about 23·2 acres. Provision is made for each department to be practically doubled in size. It is unnecessary to describe it in any detail, but it may be noted that it has a market associated with it, and that separate slaughter-halls are provided for large cattle, for small cattle (sheep and calves), and for swine (fig. 2). The population of Düsseldorf was 212,949 in 1900

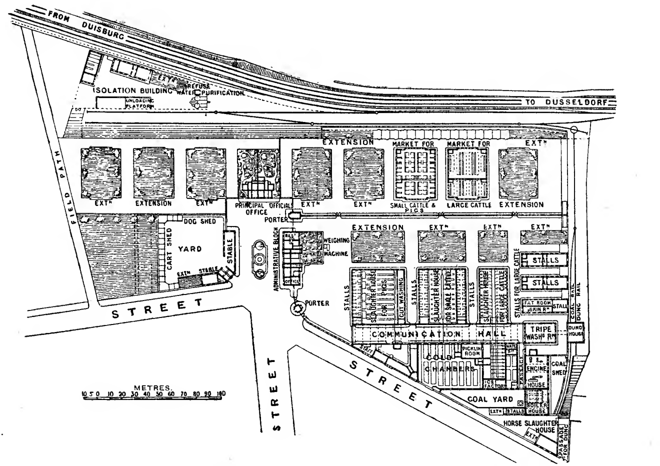


FIG. 2.—Plan of Public Slaughter-house and Cattle-market, Düsseldorf (1898).

The average cost of slaughter-houses in Germany is given by Osthoff, of Berlin (*Handbuch der Hygiene*), as 7 to 8 marks per inhabitant if no cold chamber is provided, and from 10 to 12 marks per inhabitant if there is a cold chamber, or, in more detail, as follows:—

Number of Inhabitants.	Cost of Slaughter-house per Inhabitant, in Marks.	
	Without Cold Chamber.	With Cold Chamber.
5,000– 6,000	8	12
6,000– 8,000	7	10
8,000–15,000	6	9
15,000–20,000	7	10
Over 20,000	8	10

Slaughter-houses in Germany pay their own expenses, the fees received for the use of the slaughter-house, and for examination of meat and stamping after examination, providing a sufficient sum for this purpose. The fees vary in different places. From the works of Osthoff and Schwarz it would appear that these fees average about one pfennig per kilogramme of the living animal, or about half a farthing per lb of meat.

The corporation of the city of London have erected a slaughter-house at their cattle market in Islington in which slaughtering is done in a large hall divided by partitions into separate compartments. The compartments are not let to separate butchers but are used in common. The partitions do not extend to the ceiling, but are sufficiently high to prevent the slaughtering in one compartment being seen by the occupants of other compartments, and thus they necessarily provide less opportunity for inspection than is afforded by the open-slaughtering halls of Germany. The fees charged are 1s. 6d. per head for bullocks, 4d. for calves, 2d. for sheep, and 6d. per head for pigs. The accommodation is estimated as sufficient for the slaughter of 400 cattle, 1200 sheep, and 1200 calves and pigs per day.

The centralization of the slaughtering and packing industries in the United States has not required slaughter-houses on the same plan as in Europe. Acts of Congress of 1890, 1891 and 1895 endeavoured to provide some amount of inspection, but sufficient appropriations were never made to carry it out, and there were also certain loopholes in the legislation. Although there were from time to time frequent cases of sickness directly traceable to the consumption of canned meats from the great packing centres, it was not until the publication of Upton Sinclair's *The Jungle* (1906), which dealt with the conditions in the Chicago packing yards, that steps were taken adequately to guard the public against insanitary conditions. A commission of inquiry was appointed by President Roosevelt, and as a result of its report there was passed in 1906 a national meat inspection law. This act required the department of agriculture to appoint inspectors to examine and inspect all cattle, sheep, swine and goats before being allowed to enter into any slaughtering, packing, meat-canning, rendering or similar establishments. All such animals found to show any symptoms of disease must be set apart and slaughtered separately. All carcases must be inspected and labelled as either "inspected and passed" or "inspected and condemned." The act also provides for the inspection (and condemnation if necessary) of all meat food products as well as for the sanitary examination of all slaughtering, packing and canning establishments. Inspection and examination is now carried out very carefully at all stages of the industry, from inspection of the animals before they enter the slaughtering establishments up to the finished product.

The important feature of the Chicago and certain other western American cities slaughter-houses is their adaptation for rapidly dealing with the animals which they receive. At the Chicago slaughter-houses the cattle to be slaughtered are driven up a winding viaduct, by which, in certain of the houses, they eventually reach the roof. Each animal now passes into a narrow pen, where it is at once stunned by a blow on the head. It then falls through a trap-door in the pen into an immense slaughtering-room, where the hind legs are secured, and the animal hoisted by a wire rope suspended from a trolley-line. A knife is then plunged into its throat and the carcase made to travel along the line. The carcase is next lowered to the floor, the hide taken off, the head and feet cut off, and the internal parts removed. The carcase again travels along the trolley-line to a place where it is divided into halves, which then, after washing, travel to the refrigeration-room, being trimmed while on the way. The extent of the business may be judged by the fact that over 400 cattle are killed per hour in the slaughtering-room. The cooling-rooms are so large that 13,000 halves of beef hang there at one time. The method of dealing with sheep is very similar. The animals are driven into narrow alleys, then into the slaughter-room, where their throats are cut. They next travel along a route where their skins and the internal organs are removed, and finally pass into the cooling-rooms. Swine are raised in the slaughter-room on to the trolley-line by a chain attached to the animals' feet and to a solid disk or wheel, which in revolving carries them until a mechanical contrivance throws the chain upon the trolley-line, where a knife is plunged into their throat. In its subsequent passage the carcase is scalded, scraped by a machine through which it passes, later decapitated, the internal parts removed, and the interior washed. The carcase then travels to the cooling-room.

In 1904 a British departmental (Admiralty) committee on the humane slaughtering of animals recommended that all animals should be stunned before being bled, and, with a view to sparing animals awaiting slaughter the sights and smells of the slaughter-house, that "cattle should, when possible, be slaughtered screened off from their fellows. This can be arranged in moderate-sized abattoirs by dividing up the side of the slaughter-chamber opposite to the entrance doors into stalls somewhat similar to those in a stable, but considerably wider. For quiet home-grown cattle a width of 10 ft. is sufficient, but where wilder cattle have to be killed a wider space is probably desirable. It is important that these stalls should be so arranged as not to screen the operations of slaughter from the view of the inspecting officials. Immediately after the carcases have been bled, they should be moved on to and 'dressed' in an adjoining room, screened off from the view of animals entering the slaughter-chamber. This is easily accomplished by hitching a rope (from the winch, if necessary) round the head or forelegs of the carcase, and by dragging it along the floor for the short distance into the 'dressing room.' The slaughter-stall should then at once be flushed down with the hose, so as to remove all traces of blood. This method leaves the slaughter spaces clear for the next batch of animals, whereas under the existing system there is either a loss of time through the slaughter spaces being blocked up with dressing operations, or else the next batch of animals on being brought into the slaughter-chamber are confronted with mutilated and disembowelled carcases."

The provision of public slaughter-houses enables control to be exercised over the methods of slaughtering. The above-mentioned committee state that they practically tested a large number of appliances designed for felling and stunning animals previous to "pithing," among which they mention the Bruneau and Baxter masks, the Greener patent killer, the Blitz instrument, and the Wackett punch, all of which are suitable for quiet cattle or horses. In view of the difficulty of adjusting these instruments in the case of wild or restive animals, the committee express the opinion that the poll-axe when used by an expert is on the whole the most satisfactory implement, but they recommend that no man should be permitted to use the poll-axe on a living animal until he has gone through a thorough course of training, firstly upon a dummy animal and secondly upon dead bodies. Calves, the committee state, should be stunned by a blow on the head with a club. With respect to the method of slaughter of sheep the committee discuss the method usually adopted in England, which is "to lay the sheep on a wooden crutch and then to thrust a knife through the neck below the ears, and with a second motion to insert the point, from within, between the joints of the vertebrae, thus severing the spinal cord." Observations made for the committee by Professor Starling showed that the interval between the first thrust of the knife and complete loss of sensibility varied from five to thirty seconds, and they therefore recommended that sheep should be stunned before being stuck, a practice required in Denmark, many parts of Germany, and Switzerland. It is necessary that the sheep should be struck on the top of the head between the ears and not on the forehead. The insensibility produced by the blow was found to last fully twenty seconds, a period sufficiently long for the killing to be completed if the animal is laid on the crutch before being stunned. The stunning of pigs, the committee recommended, should be insisted upon in all cases, and not, as sometimes at present, only practised in the case of large pigs which give trouble or with a view to the avoidance of noise.

The Jewish method of slaughter by cutting the throat is condemned by the committee after careful observation and after receiving reports by Sir Michael Foster and Professor Starling, the chief objection to this method being that it fails in the primary requirements of rapidity, freedom from unnecessary pain, and instantaneous loss of sensibility.

The use of public slaughter-houses has not been found to affect the prices of meat, although one of the numerous arguments used by butchers against being required to slaughter in public slaughter-houses was that they would have this effect. Inquiry on this subject by a Swedish veterinary surgeon of Stockholm, Kjerrulf, of 560 towns possessing public slaughter-houses, elicited replies from 388. Of these, 261 towns declared that as a result of the compulsory use of the abattoirs and compulsory meat inspection the price of meat had not been raised. In the case of twenty-two towns prices rose temporarily but soon reverted to their normal level. In many cases it was alleged that the temporary rise was due, not to the abattoir, but to other causes, notably the scarcity of live stock (*Our Slaughter-house System* by C. Cash, and *The German Abattoir* by Hugo Heiss, 1907).

The increasing recognition in European countries of the need for inspection, at the time of slaughter, of the flesh of all cattle intended to suppy food for man, the necessity for the provision of public slaughter-houses to make such inspection practicable, the convenience which these slaughter-houses afford to those engaged in the business of butcher, combine to ensure that, at any rate in all populous places, they will in time entirely supersede private slaughter-houses, which offer none of these advantages. No doubt the provision of public slaughter-houses will continue to be opposed by the butchers' trade so long as private slaughter houses are permitted, and, as already stated, local authorities in England are discouraged from making public provision by their inability to prevent the continuance of the use of all existing private slaughter-houses. Probably the extension to English local authorities of the power which the law of Scotland gives to the commissioners of Scottish burghs of closing private slaughter-houses when a public slaughter-house has been provided, would facilitate the much-needed substitution of public for private slaughter-houses. (S. F. M.)

SLAVE COAST. The name given to that part of the coast of West Africa extending from the river Volta to the Niger delta; forming part of the Guinea coast (see GUINEA). From the beginning of the 16th to the end of the 18th century this region was a principal resort of the Europeans engaged in the slave trade. Politically the Slave Coast is divided between Germany, France and Great Britain, the German section forming part of Togoland (*q.v.*), the French section the seaboard of Dahomey (*q.v.*), and the British section the Lagos province of Nigeria (see LAGOS).

SLAVERY. It appears to be true that, in the words of Dunoyer, the economic régime of every society which has recently become sedentary is founded on the slavery of the industrial professions. In the hunter period the savage warrior does not enslave his vanquished enemy, but slays him; the women of a conquered tribe he may, however, carry off and appropriate as wives or as servants, for in this period domestic labour falls almost altogether on their sex. In the pastoral stage slaves will be captured only to be sold, with the exception of a few who may be required for the care of flocks or the small amount of cultivation which is then undertaken. It is in proportion as a sedentary life prevails, and agricultural exploitation is practised on a larger scale, whilst warlike habits continue to exist, that the labour of slaves is increasingly introduced to provide food for the master, and at the same time save him from irksome toil. Of this stage in the social movement slavery seems to have been, as we have said, a universal and inevitable accompaniment.

But wherever theocratic organizations established themselves slavery in the ordinary sense did not become a vital element in the social system. The members of the lowest class were not in a state of individual subjection: the entire caste to which they belonged was collectively subject. It is in the communities in which the military order obtained an ascendancy over the sacerdotal, and which were directly organized for war, that slavery (as the word is commonly understood) had its natural and appropriate place. It is not merely that in its first establishment slavery was an immense advance by substituting for the immolation of captives, often accompanied by cannibalism, their occupation in labour for the benefit of the victor. This advantage, recalled by an old though erroneous[1]

[1] *Servus* is not cognate with *servāre*, as has often been supposed; it is really related to the Homeric εἴρερος and the verb εἴρω, with which the Latin *sero* is to be connected. It may be here mentioned that *slave* was originally a national name; it meant a man of Slavonic race captured and made a bondman to the Germans. "From the Euxine to the Adriatic, in the state of captives or subjects, . . . they [the Slavonians] overspread the land, and the national appellation of the *Slaves* has been degraded by chance or malice from the signification of glory to that of servitude" (Gibbon, *Decline and Fall*, ch. lv.). The historian alludes to the derivation of the national name from *slava*, glory. See Skeat's *Etym. Dict.*, *s.v.*; see also SLAVS.

etymology, is generally acknowledged. But it is not so well understood that slavery discharged important offices in the later social evolution—first, by enabling military action to prevail with the degree of intensity and continuity requisite for the system of incorporation by conquest which was its final destination; and, secondly, by forcing the captives, who with their descendants came to form the majority of the population in the conquering community, to an industrial life, in spite of the antipathy to regular and sustained labour which is deeply rooted in human nature. As regards the latter consideration, it is enough to say that nowhere has productive industry developed itself in the form of voluntary effort; in every country of which we have any knowledge it was imposed by the strong upon the weak, and was wrought into the habits of the people only by the stern discipline of constraint. From the former point of view the freeman, then essentially a warrior, and the slave were mutual auxiliaries, simultaneously exercising different and complementary functions—each necessary to the community. In modern slavery, on the other hand, where the occupations of both parties were industrial, the existence of a servile class only guaranteed for some of them the possibility of self-indulgent ease, whilst it imposed on others the necessity of indigent idleness.

It was in the Roman state that military action—in Greece often purposeless and, except in the resistance to Persia, on the whole fruitless—worked out the social mission which formed its true justification. Hence at Rome slavery also most properly found its place, so long as that mission was in progress of accomplishment. As soon as the march of conquest had reached its natural limit, slavery began to be modified; and when the empire was divided into the several states which had grown up under it, and the system of defence characteristic of the middle ages was substituted for the aggressive system of antiquity, slavery gradually disappeared, and was replaced by serfdom.

We have so far dealt with the political results of ancient slavery, and have found it to have been in certain respects not only useful but indispensable. When we consider its moral effects, whilst endeavouring to avoid exaggeration, we must yet pronounce its influence to have been profoundly detrimental. In its action on the slave it marred in a great measure the happy effects of habitual industry by preventing the development of the sense of human dignity which lies at the foundation of morals. On the morality of the masters—whether personal, domestic, or social—the effects of the institution were disastrous. The habit of absolute rule, always dangerous, was peculiarly corrupting when it penetrated every department of daily life, and when no external interference checked individual caprice in its action on the feelings and fortunes of inferiors. It tended to destroy the power of self-command, and exposed the master to the baneful influences of flattery. As regards domestic morality, the system offered constant facilities for libertinism, and tended to subvert domestic peace by compromising the dignity and ruining the happiness of the wife. The sons of the family were familiarized with vice, and the general tone of the younger generation was lowered by their intimate association with a despised and degraded class. These deplorable results were, of course, not universally produced; there were admirable exceptions both among masters and among slaves—instances of benevolent protection on the one side and of unselfish devotion on the other; but the evil effects without doubt greatly preponderated.

Heroic times.

Greece.—We find slavery fully established in the Homeric period. The prisoners taken in war are retained as slaves, or sold (*Il.* xxiv. 752) or held at ransom (*Il.* vi. 427) by the captor. Sometimes the men of a conquered town or district are slain and the women carried off (*Od.* ix. 40). Not unfrequently free persons were kidnapped by pirates and sold in other regions, like Eumaeus in the *Odyssey*. The slave might thus be by birth of equal rank with his master, who knew that the same fate might befall himself or some of the members of his family. The institution does not present itself in a very harsh form in Homer, especially if we consider (as Grote suggests) that "all classes were much on a level in taste, sentiment and instruction." The male slaves were employed in the tillage of the land and the tending of cattle, and the females in domestic work and household manufactures. The principal slaves often enjoyed the confidence of their masters and had important duties entrusted to them; and, after lengthened and meritorious service, were put in possession of a house and property of their own (*Od.* xiv. 64). Grote's idea that the women slaves were in a more pitiable condition than the males does not seem justified, except perhaps in the case of the *aletrides*, who turned the household mills which ground the flour consumed in the family, and who were sometimes overworked by unfeeling masters (*Od.* xx. 110-119). Homer marks in a celebrated couplet his sense of the moral deterioration commonly wrought by the condition of slavery (*Od.* xvii. 322).

Historic period—sources of slavery.

It is, however, in historic Greece, where we have ample documentary information, that it is most important to study the system. The sources of slavery in Greece were: (1) Birth, the condition being hereditary. This was not an abundant source, women slaves being less numerous than men, and wise masters making the union of the sexes rather a reward of good service than a matter of speculation (Xen. *Oecon.* 9. 5). It was in general cheaper to buy a slave than to rear one to the age of labour. (2) Sale of children by their free parents, which was tolerated, except in Attica, or their exposure, which was permitted, except at Thebes. The consequence of the latter was sometimes to subject them to a servitude worse than death, as is seen in the plays of Plautus and Terence, which, as is well known, depict Greek, not Roman, manners. Freemen, through indigence, sometimes sold themselves, and at Athens, up to the time of Solon, an insolvent debtor became the slave of his creditor. (3) Capture in war. Not only Asiatics and Thracians thus became slaves, but in the many wars between Grecian states, continental or colonial, Greeks were reduced to slavery by men of their own race. Callicratidas pronounced against the enslavement of Greeks by Greeks, but violated his own principle, to which, however, Epaminondas and Pelopidas appear to have been faithful. (4) Piracy and kidnapping. The descents of pirates on the coasts were a perpetual source of danger; the pirate was a gainer either by the sale or by the redemption of his captives. If ransomed, the victim became by Athenian law the slave of his redeemer till he paid in money or labour the price which had been given for him. Kidnappers (*andrapodistae*) carried off children even in cities, and reared them as slaves. Whether from hostile forays or from piracy, any Greek was exposed to the risk of enslavement. (5) Commerce. Besides the sale of slaves which took place as a result of the capture of cities or other military operations, there was a systematic slave trade. Syria, Pontus, Lydia, Galatia, and above all Thrace were sources of supply. Egypt and Ethiopia also furnished a certain number, and Italy a few. Of foreigners, the Asiatics bore the greatest value, as most amenable to command, and most versed in the arts of luxurious refinement. But Greeks were highest of all in esteem, and they were much sought for foreign sale. Greece proper and Ionia supplied the petty Eastern princes with courtesans and female musicians and dancers. Athens was an important slave market, and the state profited by a tax on the sales; but the principal marts were those of Cyprus, Samos, Ephesus and especially Chios.

Employments of slaves.

The slaves were employed either in domestic service—as household managers, attendants or personal escorts—or in work of other kinds, agricultural or urban. In early Attica, and even down to the time of Pericles, the landowners lived in the country. The Peloponnesian War introduced a change; and after that time the proprietors resided at Athens, and the cultivation was in the hands of slaves. In manufactures and commerce, also, servile gradually displaced free labour. Speculators either directly employed slaves as artisans or commercial and banking agents, or hired them out, sometimes for work in mines or factories, sometimes for service in private houses, as cooks, flute-players, &c., or for viler uses. There were also public slaves; of these some belonged to temples, to which they were presented as offerings, amongst them being the courtesans who acted as *hieroduli* at Corinth and at Eryx in Sicily; others were appropriated to the service of the magistrates or to public works; there were at Athens 1200 Scythian archers for the police of the city; slaves served, too, in the fleets, and were employed in the armies,—commonly as workmen, and exceptionally as soldiers.

Condition.

The condition of slaves at Athens was not in general a wretched one. Demosthenes (*In Mid.* p. 530) says that, if the barbarians from whom the slaves were bought were informed of the mild treatment they received, they would entertain a great esteem for the Athenians. Plautus in more than one place thinks it necessary to explain to the spectators of his plays that slaves at Athens enjoyed such privileges, and even licence, as must be surprising to a Roman audience. The slave was introduced with certain customary rites into his position in the family; he was in practice, though not by law, permitted to accumulate a private fund of his own; his marriage was also recognized by custom; though in general excluded from sacred ceremonies and public sacrifices, slaves were admissible to religious associations of a private kind; there were some popular festivals in which they were allowed to participate; they had even special ones for themselves both at Athens and in other Greek centres. Their remains were deposited in the family tomb of their master, who sometimes erected monuments in testimony of his affection and regret. They often lived on terms of intimacy either with the head of the house or its younger members; but it is to be feared that too often this intimacy was founded, not on mutual respect, as in the heroic example of Ulysses and Eumaeus, but on insolent self-assertion on the one side and a spirit of unworthy compliance on the other, the latter having its *raison d'être* in degrading services rendered by the slave. Aristophanes and Plautus show us how often resort was had to the discipline of the lash even in the case of domestic slaves. Those employed in workshops, whose overseers were themselves most commonly of servile status, had probably a harder lot than domestics; and the agricultural labourers were not unfrequently chained, and treated much in the same way as beasts of burden. The displeasure of the master sometimes dismissed his domestics to the more oppressive labours of the mill or the mine. A refuge from cruel treatment was afforded by the temples and altars of the gods and by the sacred groves. Nor did Athenian law leave the slave without protection. He had, as Demosthenes boasts, an action for outrage like a freeman, and his death at the hand of a stranger was avenged like that of a citizen (Eurip. *Hec.* 288), whilst, if caused by his master's violence, it had to be atoned for by exile and a religious expiation. Even when the slave had killed his master, the relatives of the house could not themselves inflict punishment; they were obliged to hand him over to the magistrate to be dealt with by legal process. The slave who had just grounds of complaint against his master could demand to be sold; when he alleged his right to liberty, the law granted him a defender and the sanctuaries offered him an asylum till judgment should be given. Securities were taken against the revolt of slaves by not associating those of the same nationality and language; they were sometimes fettered to prevent flight, and, after a first attempt at escape, branded to facilitate their recovery. There were treaties between states for the extradition of fugitives, and contracts of mutual assurance between individuals against their loss by flight. Their inclination to take advantage of opportunities for this purpose is shown by the number that escaped from Athens to join the Spartans when occupying Decelea. There were formidable revolts at the mines of Laurium, and more than once in Chios. The evidence of slaves—women as well as men—was often, with the consent of their masters, taken by torture; and that method is generally commended by the orators as a sure means of arriving at the truth.

Emancipation. The slave could purchase his liberty with his *peculium* by agreement with his master. He could be liberated by will, or, during his master's life, by proclamation in the theatre, the law courts, or other public places, or by having his name inscribed in the public registers, or, in the later age of Greece, by sale or donation to certain temples—an act which did not make the slave a hierodulus but a freeman. Conditions were sometimes attached to emancipation, as of remaining for life or a definite time with the former master, or another person named by him, or of performing some special service; payments or rights of succession to property might also be reserved. By manumission the Athenian slave became in relation to the state a metic, in relation to his master a client. He was thus in an intermediate condition between slavery and complete freedom. If the freedman violated his duties to his patron he was subject to an action at law, and if the decision were against him he was again reduced to slavery. He became a full member of the state only, as in the case of foreigners, by a vote in an assembly of six thousand citizens; and even this vote might be set aside by a *graphē paranomōn*. Slaves who had rendered eminent services to the public, as those who fought at Arginusae and at Chaeronea, were at once admitted to the status of citizens in the class of (so-called) Plataeans. But it would appear that even in their case some civic rights were reserved and accorded only to their children by a female citizen. The number of freedmen at Athens seems never to have been great. (See further GREECE, *Ancient History*, § 5.)

Theoretic views on slavery. It is well known that Aristotle held slavery to be necessary and natural, and, under just conditions, beneficial to both parties in the relation—views which were correct enough from the political side, regard being had to the contemporary social state. His practical motto, if he is the author of the *Economics* attributed to him, is—" no outrage, and no familiarity." There ought, he says, to be held out to the slave the hope of liberty as the reward of his service. Plato condemned the practice, which the theory of Aristotle also by implication sets aside as inadmissible, of Greeks having Greeks for slaves. In the *Laws* he accepts the institution as a necessary though embarrassing one, and recommends for the safety of the masters that natives of different countries should be mixed and that they should all be well treated. But, whilst condemning harshness towards them, he encourages the feeling of contempt for them as a class. The later moral schools of Greece scarcely at all concern themselves with the institution. The Epicurean had no scruple about the servitude of those whose labours contributed to his own indulgence and tranquillity. The Stoic regarded the condition of freedom or slavery as an external accident, indifferent in the eye of wisdom; to him it was irrational to see in liberty a ground of pride or in slavery a subject of complaint; from intolerable indignity suicide was an ever-open means of escape. The poets—especially the authors of the New Comedy—strongly inculcate humanity, and insist on the fundamental equality of the slave. The celebrated " homo sum " is a translation from Alexis, and the spirit of it breathes in many passages of the Greek drama. A fragment of Philemon declares, as if in reply to Aristotle, that not nature, but fortune, makes the slave. Euripides, as might be expected from his humanitarian cast of sentiment, and the " premature modernism " which has been remarked in him, rises above the ordinary feelings of his time in regard to the slaves. As Paley says, he loves " to record their fidelity to their masters, their sympathy in the trials of life, their gratitude for kindness and considerate treatment, and their pride in bearing the character of honourable men. . . . He allows them to reason, to advise, to suggest; and he even makes them philosophize on the follies and the indiscretions of their superiors " (compare *Med.* 54; *Orest.* 869; *Hel.* 728; *Ion.* 854; *Frag. Melan.* 506; *Phrix.* 823). But we are not to suppose that even he, latitudinarian and innovator as he was, could have conceived the possibility of abolishing an institution so deeply rooted in the social conditions, as well as in the ideas, of his time.

(For the Helots in Laconia, see HELOTS.)

Rome.—We have already observed that the Roman system of life was that in which slavery had its most natural and relatively legitimate place; and accordingly it was at Rome that, as Blair has remarked, the institution was more than anywhere else " extended in its operation and methodized in its details."

Sources. We must distinguish from the later slavery at Rome what Mommsen calls " the old, in some measure innocent " slavery, under which the farmer tilled the land along with his slave, or, if he possessed more land than he could manage, placed the slave—either as a steward, or as a sort of lessee obliged to render up a portion of the produce—over a detached farm. Though slaves were obtained by the early victories of Rome over her Italian neighbours, no large number was employed on the small holdings of those periods. But the extension of properties in the hands of the patricians, and the continued absences of citizens required by the expanding system of conquest, necessarily brought with them a demand for slave labour, which was increasingly supplied by captives taken in war. Of the number furnished from this source a few particulars from the time of the mature republic and the first century of the empire will give some idea. In Epirus, after the victories of Aemilius Paullus, 150,000 captives were sold. The prisoners at Aquae Sextiae and Vercellae were 90,000 Teutons and 60,000 Cimbri. Caesar sold on a single occasion in Gaul 63,000 captives. But slavery, as Hume has shown, is unfavourable to population. Hence a regular commerce in slaves was established, which was based on the " systematically-prosecuted hunting of man," and indicated an entire perversion of the primitive institution, which was essentially connected with conquest. The pirates sold great numbers of slaves at Delos, where was the chief market for this kind of wares; and these sales went on as really, though more obscurely, after the successful expedition of Pompey. There was a regular importation to Rome of slaves, brought to some extent from Africa, Spain and Gaul, but chiefly from Asiatic countries—Bithynia, Galatia, Cappadocia and Syria. A *portorium*—apparently one-eighth for eunuchs, one-fortieth for others—was paid on their import or export, and a duty of 2 or 4 % on their sale.

There were other sources from which slavery was alimented, though of course in a much less degree. Certain offences reduced the guilty persons to slavery (*servi poenae*), and they were employed in public work in the quarries or the mines. Originally, a father could sell his children. A creditor could hold his insolvent debtor as a slave, or sell him out of the city (*trans Tiberim*). The enslavement of creditors, overwhelmed with usury in consequence of losses by hostile raids or their own absence on military service, led to the secession to the Mons Sacer (493 B.C.). The Poetelian law (326 B.C.) restricted the creditor's lien (by virtue of a *nexum*) to the goods of his debtor, and enacted that for the future no debtor should be put in chains; but we hear of debtors *addicti* to their creditors by the tribunals long after—even in the time of the Punic Wars.

Employments. There were *servi publici* as well as *privati*. The service of the magistrates was at first in the hands of freemen; but the lower offices, as of couriers, servants of the law courts, of prisons and of temples, were afterwards filled by slaves. The execution of public works also came to be largely committed to them—as the construction of roads, the cleansing of the sewers and the maintenance of the aqueducts. Both kinds of functions were discharged by slaves, not only at Rome, but in the rural and provincial municipalities. The slaves of a private Roman were divided between the *familia rustica* and the *familia urbana.* At the head of the *familia rustica* was the *villicus*, himself a slave, with the wife who was given him at once to aid him and to bind him to his duties. Under him were the several groups employed in the different branches of the exploitation and the care of the cattle and flocks, as well as those who kept or prepared the food, clothing and tools of the whole staff and those who attended on the master in the various species of rural sports. A slave prison (*ergastulum*) was part of such an establishment, and there were slaves whose office it was to punish the offences of their fellows. To the *familia urbana* belonged those who discharged the duties of domestic attendance, the service of the toilet, bath, table and kitchen, besides the entertainment of the master and his guests by dancing, singing and other arts. There were, besides, the slaves who accompanied the master and mistress out of doors, and were chosen for their beauty and grace as guards of honour, for their strength as chairmen or porters, or for their readiness and address in remembering names, delivering messages of courtesy and the like. There were also attached to a great household physicians, artists, secretaries, librarians, copyists, preparers of parchment, as well as pedagogues and preceptors of different kinds—readers, grammarians, men of letters and even philosophers—all of servile condition, besides accountants, managers and agents for the transaction of business. Actors, comic and tragic, pantomimi, and the performers of the circus were commonly slaves, as were also the gladiators. These last were chosen from the most warlike races—as the Samnites, Gauls and Thracians. *Familiae* of gladiators were kept by private speculators, who hired them out; they were sometimes owned by men of high rank.

Several special examples and other indirect indications show that the wealthier Romans possessed large *familiae*. This may be inferred from the *columbaria* of the house of Livia and of other great houses. The slaves of Pedanius Secundus, who, in spite of a threatened outbreak of the indignant populace, were all put to death because they had been under their master's roof when he was murdered, were four hundred in number. Pliny tells us that Caecilius, a freedman of the time of Augustus, left by his will as many as 4116. The question as to the total number of slaves at Rome or in Italy is a very difficult one, and it is not, perhaps, possible to arrive with any degree of certainty at an approximate estimate. Gibbon supposes that there were in the Roman world in the reign of Claudius at least as many slaves as free inhabitants. But Blair seems right in believing that this number, though probably correct for an earlier period, is much under the truth for the age to which it is assigned. He fixes the proportion of slaves to free men as that of three to one for the time between the conquest of Greece (146 B.C.) and the reign of Alexander Severus (A.D. 222–235). The entire number of slaves in Italy would thus have been, in the reign of Claudius, 20,832,000.

Laws. By the original Roman law the master was clothed with absolute dominion over the slave, extending to the power of life and death, which is not surprising when we consider the nature of the *patria potestas*. The slave could not possess property of any kind; whatever he acquired was legally his master's. He was, however, in practice permitted to enjoy and accumulate chance earnings or savings, or a share of what he produced, under the name of *peculium*. A master could not enter into a contract with his slave, nor could he accuse him of theft before the law; for, if the slave took anything, this was not a subtraction, but only a displacement, of property. The union of a male and female slave had not the legal character of a marriage; it was a cohabitation (*contubernium*) merely, which was tolerated, and might be terminated at will, by the master; a slave was, therefore, not capable of the crime of adultery. Yet general sentiment seems to have given a stronger sanction to this sort of connexion; the names of husband and wife are freely used in relation to slaves on the stage, and even in the laws, and in the language of the tombs. For entering the military service or taking on him any state office a slave was punished with death. He could not in general be examined as a witness, except by torture. A master, when accused, could offer his slaves for the "question," or demand for the same purpose the slaves of another; and, if in the latter case they were injured or killed in the process, their owner was indemnified. A slave could not accuse his master, except of adultery or incest (under the latter name being included the violation of sacred things or places); the case of high treason was afterwards added to these. An accused slave could not invoke the aid of the tribunes. The penalties of the law for crime were specially severe on slaves.

Treatment of slaves. Columella, like Xenophon, favours a certain friendliness and familiarity in one's intercourse with his farm slaves. Cato ate and drank the same coarse victuals as his slaves, and even had the children suckled by his wife, that they might imbibe a fondness for the family. But he had a strict eye to profit in all his dealings with them. He allowed the *contubernium* of male and female slaves at the price of a money payment from their *peculium*. Columella regarded the gains from the births as a sufficient motive for encouraging these unions, and thought that mothers should be rewarded for their fecundity; Varro, too, seems to have taken this view. The immense extension of the rural estates (*latifundia*) made it impossible for masters to know their slaves, even if they were disposed to take trouble for the purpose. Effective superintendence even by overseers became less easy; the use of chains was introduced, and these were worn not only in the field during working hours but at night in the *ergastulum* where the slaves slept. Urban slaves had probably often a life as little enviable, especially those who worked at trades for speculators. Even in private houses at Rome, so late as the time of Ovid, the porter was chained. In the *familia urbana* the favourites of the master had good treatment, and might exercise some influence over him which would lead to their receiving flattery and gifts from those who sought his vote or solicited his support. Doubtless there was often genuine mutual affection; slaves sometimes, as in noted instances during the civil wars, showed the noblest spirit of devotion to their masters. Those who were not inmates of the household, but were employed outside of it as keepers of a shop or boat, chiefs of workshops, or clerks in a mercantile business, had the advantage of greater freedom of action. The slaves of the *leno* and the *lanista* were probably in most cases not only degraded but unhappy. The lighter punishments inflicted by masters were commonly personal chastisement or banishment from the town house to rural labour; the severer were employment in the mill (*pistrinum*) or relegation to the mines or quarries. To the mines also speculators sent slaves; they worked half-naked, men and women, in chains, under the lash and guarded by soldiers. Vedius Pollio, in the time of Augustus, was said to have thrown his slaves, condemned sometimes for trivial mistakes or even accidents, to the lampreys in his fishpond. Cato advised the agriculturist to sell his old oxen and his old slaves, as well as his sick ones; and sick slaves were exposed in the island of Aesculapius in the Tiber; by a decree of Claudius slaves so exposed, if they recovered, could not be reclaimed by their masters.

Though the Roman slaves were not, like the Spartan Helots, kept obedient by systematic terrorism, their large numbers were a constant source of danger. The law under which the slaves of Pedanius were put to death, probably introduced under Augustus and more fully enacted under Nero, is sufficient proof of this anxiety, which indeed is strongly stated by Tacitus in his narrative of the facts. There had been many conspiracies amongst the slaves in the course of Roman history, and some formidable insurrections. The growth of the *latifundia* made the slaves more and more numerous and formidable. Free labour was discountenanced. Cato, Varro and Columella all agree that slave labour was to be preferred to free except in unhealthy regions and for large occasional operations, which probably transcended the capacity of the permanent *familia rustica*. Cicero and Livy bear testimony to the disappearance of a free plebs from the country districts and its replacement by gangs of slaves working on great estates. The worst form of such praedial slavery existed in Sicily, whither Mommsen supposes that its peculiarly harsh features had been brought by the Carthaginians. In Sicily, accordingly, the first really serious servile insurrections took place. The rising under Eunus in 133 B.C. was with some difficulty suppressed by Rupilius. Partial revolts in Italy succeeded; and then came the second Sicilian insurrection under Trypho and Athenio, followed by the Servile War in Italy under Spartacus (*q.v.*). Clodius and Milo used bands of gladiators in their city riots, and this action on the part of the latter was approved by Cicero. In the First Civil War they were to be found in both camps, and the murderers of Caesar were escorted to the Capitol by gladiators. Antony, Octavius, and Sextus Pompeius employed them in the Second Civil War; and it is recorded by Augustus on the Monumentum Ancyranum that he gave back to their masters for punishment about 30,000 slaves who had absconded and borne arms against the state. Under Tiberius, at the death of Caligula, and in the reign of Nero there were threatening movements of the slaves. In the wars from Otho to Vespasian they were employed, as Tacitus tells us, even by the most scrupulous generals.

Blair, in comparing the Greek and Roman systems of slavery, points with justice to the greater facility and frequency of emancipation as the great superiority of the latter. No Roman slave, he says, "needed to despair of becoming both a freeman and a citizen." Manumission was of two kinds—*justa* or regular, and *minus justa*. Of *manumissio justa* there were four modes: (1) by adoption, rarely resorted to; (2) by testament, already recognized in the Twelve Tables; (3) by *census*, which was of exceptional use, and did not exist later than the time of Vespasian; and (4) by *vindicta*, which was the usual form. In the last method the master turned the slave round, with the words "liber esto," in the presence of the praetor, that officer or his lictor at the same time striking the slave with his rod. The *manumissio minus justa* was effected by a sufficient manifestation of the will of the master, as by letter, by words, by putting the *pileus* (or cap of liberty) on the slave, or by any other formality which had by usage become significant of the intention to liberate, or by such an act as making the slave the guardian of his children. This extra-legal sort of manumission was incomplete and precarious; even after the lex *Junia Norbana* (A.D. 19), which assimilated the position of those so liberated to that of the Latin colonists, under the name of Latini juniores, the person remained in the eye of the law a slave till his death and could not dispose of his *peculium*.

A freedman, unless he became such by operation of law, remained client of his master, and both were bound by the mutual obligations arising out of that relation. These obligations existed also in the case of freedmen of the state, of cities, temples and corporations. The freedman took his former master's name; he owed him deference (*obsequium*) and aid (*officium*); and neglect of these obligations was punished, in extreme cases even with loss of liberty. Conditions might be annexed by the master to the gift of freedom, as of continued residence with him, or of general service or some particular duty to be performed, or of a money payment to be made. But the praetor Rutilius, about the beginning of the 1st century B.C., limited the excessive imposition of such conditions, and his restrictions were carried further by the later jurists and the imperial constitutions. Failing natural heirs of an intestate freedman, the master, now patron, succeeded to his property at his death; and he could dispose by will of only half his possessions, the patron receiving the other half. Freedmen and their sons were subject to civil disabilities; the third generation became *ingenui* (full citizens). Thus, the slave element tended to merge itself in the general popular body.

It was often a pecuniary advantage to the master to liberate his slave; he obtained a payment which enabled him to buy a substitute, and at the same time gained a client. This of course presupposes the recognition of the right of the slave to his *peculium*; and the same is implied in Cicero's statement that a diligent slave could in six years purchase his freedom. Augustus set himself against the undue multiplication of manumissions, probably considering the rapid succession of new citizens a source of social instability, and recommended a similar policy to his successor. The lex Aelia Sentia (about A.D. 3) forbade manumission, except in strictly limited cases, by masters under 20 years of age or of slaves under 30; and the lex Furia Caninia (about A.D. 7) fixed the proportion of a man's slaves which he could liberate by testament, and forbade more than a hundred being so enfranchised, whatever might be the the number of the *familia*. Under the empire the freedmen rose steadily in influence; they became admissible to the rank of equites and to the senate; they obtained provincial governments, and were appointed to offices in the imperial household which virtually placed them at the head of administrative departments (see PALLAS and NARCISSUS). Freedmen of humbler rank, on the other hand, filled the minor offices in the administrative service, in the city cohorts, and in the army; and we shall find that they entered largely into the trades and professions when free labour began to revive. They appeared also in literature, *e.g.* Tiro, the amanuensis of Cicero; Hyginus, the librarian of Augustus; Livius Andronicus, Caecilius, Statius, Terence, Publilius Syrus, Phaedrus and Epictetus.

In the 2nd century of the Christian era we find a marked change with respect to the institution of slavery, both in the region of thought and in that of law. Already the principles of reason and humanity had been applied to the subject by Seneca. But it was in the 2nd century, as we have said, that "the victory of moral ideas" in this, as in other departments of life, became "decisive.... Dio Chrysostom, the adviser of Trajan, is the first Greek writer who has pronounced the principle of slavery to be contrary to the law of nature" (Mark Pattison). And a parallel change is found in the practical policy of the state. The military vocation of Rome was now felt to have reached its normal limits; and the emperors, understanding that, in the future, industrial activity must prevail, prepared the abolition of slavery as far as was then possible, by honouring the freedmen, by protecting the slave against his master, and by facilitating manumissions. The general tendency both of the imperial constitutions and of the maxims of the legists is in favour of liberty. The practices of exposure and sale of children, and of giving them in pledge for debt, are forbidden. Diocletian forbade a free man to sell himself. Kidnappers (*plagiarii*) were punished with death. The insolvent debtor was withdrawn from the yoke of his creditor. While the slave trade was permitted, the mutilation of boys and young men, too often practised, was punished with exile and even with death. In redhibitory actions (for the annulment of sales), if a slave were returned to the seller, so must also be his parents, brothers and *personae contubernio conjunctae*. In the interpretation of testaments it was to be assumed that members of the same family were not to be separated by the division of the succession. The law also favoured in special cases the security of the *peculium*, though in general principle it still remained the property of the master. The state granted to public slaves the right of bequeathing half their possessions; and private persons sometimes permitted similar dispositions even to a greater extent, though only within the *familia*. Hadrian took from masters the power of life and death and abolished the subterranean prisons. Antoninus Pius punished him who killed his own slave as if he had killed another's. Already in the time of Nero the magistrates had been ordered to receive the slave's complaint of ill-treatment; and the lex Petronia, belonging to the same or an earlier period, forbade masters to hand over their slaves to combats with wild beasts. Antoninus directed that slaves treated with excessive cruelty, who had taken refuge at an altar or imperial image, should be sold; and this provision was extended to cases in which the master had employed a slave in a way degrading to him or beneath his character. M. Aurelius gave to masters an action against their slaves for any cause of complaint, thus bringing their relation more directly under the surveillance of law and public opinion. A slave's oath could still not be taken in a court of law; he was interrogated by the "question"; but the emperors and jurists limited in various ways the application of torture, adding, however, as we have mentioned, to the cases in which it could previously be appealed to that of the crime of *majestas*. For certain alleged offences of the master the slave could bring an action, being represented for the purpose by an *adsertor*. Emancipation was facilitated. The power of imposing conditions on testamentary manumissions was restricted, and these conditions interpreted in the sense most favourable to freedom. The emperor could confer liberty by presenting a gold ring to a slave with the consent of the master, and the legal process called *restitutio natalium* made him a full citizen. It was decided that liberty could not be forfeited even by a prescription of sixty years' duration.

Influence of Christianity.

The rise of Christianity in the Roman world still further improved the condition of the slave. The sentiments it created were not only favourable to the humane treatment of the class in the present, but were the germs out of which its entire liberation was destined, at a later period, in part to arise. It is sometimes objected that the Christian church did not denounce slavery as a social crime and insist on its abolition. We have seen that slavery was a fundamental element of the old Roman constitution. When the work of conquest had been achieved, it could not be expected that a radical alteration should be suddenly wrought either in the social system which was in harmony with it, or even in the general ideas which had grown up under its influence. The latter would, indeed, be gradually affected; and accordingly we have observed a change in the policy of the law, indicating a change in sentiment with respect to the slave class, which does not appear to have been at all due to Christian teaching. But the institution itself could not be at once seriously disturbed. The results must have been disastrous, most of all to the slave population itself. Before that end could be accomplished, an essentially new social situation must come into existence. But in the meantime much might be done towards further mitigating the evils of slavery, especially by impressing on master and slave their relative duties and controlling their behaviour towards one another by the exercise of an independent moral authority. This was the work open to the Christian priesthood, and it cannot be denied that it was well discharged. Whilst the fathers agree with the Stoics of the 2nd century in representing slavery as an indifferent circumstance in the eye of religion and morality, the contempt for the class which the Stoics too often exhibited is in them replaced by a genuine sympathy. They protested against the multiplication of slaves from motives of vanity in the houses of the great, against the gladiatorial combats (ultimately abolished by the noble self-devotion of a monk) and against the consignment of slaves to the theatrical profession, which was often a school of corruption. The church also encouraged the emancipation of individual slaves and the redemption of captives. And its influence is to be seen in the legislation of the Christian emperors, which softened some of the harshest features that still marked the institution. But a stronger influence of Christianity appears in Theodosius, and this influence is at the highest in the legislation of Justinian. Its systematic effort is, in his own words, "pro libertate, quam et fovere et tueri Romanis legibus et praecipue nostro numini peculiare est." Law still refused in general to recognize the marriages of slaves; but Justinian gave them a legal value after emancipation in establishing rights of succession. Unions between slaves and free women, or between a freeman and the female slave of another, continued to be forbidden, and were long punished in certain circumstances with atrocious severity. As witness, the slave was still subject to the question; as criminal, he was punished with greater rigour than the freeman. If he accused his master of a crime, unless the charge was of treason, he was burnt. But he could maintain a legal claim to his own liberty, not now merely through an *adsertor*, but in person. A female slave was still held incapable of the offence of adultery; but Justinian visited with death alike the rape of a slave or freedwoman and that of a free maiden. Already the master who killed his slave had been punished as for homicide, except in the case of his unintended death under correction; Constantine treated as homicide a number of specially-enumerated acts of cruelty. Even under Theodosius the combats of the amphitheatre were permitted, if not encouraged, by the state authorities; these sports were still expected from the candidates for public honours. Combats of men with beasts were longest continued; they had not ceased even in the early years of the reign of Justinian. A new process of manumission was now established, to be performed in the churches through the intervention of the ministers of religion; and it was provided that clerics could at any time by mere expression of will liberate their slaves. Slaves who were admitted to holy orders, or who entered a monastery, became freemen, under certain restrictions framed to prevent fraud or injustice. Justinian abolished the personal conditions which the legislation of Augustus had required to be satisfied by the master who emancipated and the slave who was manumitted, and removed the limitation of number. The liberated slave, whatever the process by which he had obtained his freedom, became at once a full citizen, his former master, however, retaining the right of patronage, the abolition of which would probably have discouraged emancipation.

Transition to Serfdom.—The slavery of the working classes was not directly changed into the system of personal freedom. There was an intermediate stage which has not always been sufficiently discriminated from slavery. We mean the régime of serfdom. In studying the origin of this transitional state of things, four principal considerations have to be kept in view. (1) As Gibbon observes, the completion of the Roman system of conquest reduced the supply of slaves. It is true that, when the barbarian invasions began in the 3rd century, many captives were made, who, when not enrolled in the army, were employed in agriculture or domestic service; but the regular importation was increasingly diminished. This improved the condition of the slave by rendering his existence an object of greater value to his master. It was clearly to the interest of each family to preserve indefinitely its own hereditary slaves. Hence the abolition of the external slave trade tended, in fact, to put an end to internal sales, and the slaves became attached to the households or lands of their masters. (2) The diminished supply of slaves further acted in the direction of the rehabilitation of free labour. A general movement of this kind is noticeable from the 2nd century onwards. Freemen had always been to some extent employed in the public service. In private service superior posts were often filled by freedmen; the higher arts—as medicine, grammar, painting—were partly in the hands of freedmen and even of *ingenui*; the more successful actors and gladiators were often freedmen. In the factories or workshops kept by wealthy persons slave labour was mainly employed; but free artisans sometimes offered their services to these establishments or formed associations to compete with them. We have seen that free persons had all along been to some extent employed in the cultivation of land as hired labourers, and, as we shall presently find, also as tenants on the great estates. How all this operated we shall understand when we examine the remarkable organization of the state introduced by Diocletian and his successors. (3) This organization established in the Roman world a personal and hereditary fixity of professions and situations which was not very far removed from the caste system of the East. The purpose of this was doubtless to resist by a strong internal consolidation the shock of the invasions, to secure public order, to enforce industrious habits, and to guarantee the financial resources of the state. Personal independence was largely sacrificed, but those still more important ends were in a great measure attained. This system, by diminishing the freeman's mastery over himself and his power to determine his occupation, reduced the interval between him and the slave; and the latter on the one hand, the free domestic servant and workshop labourer on the other, both passed insensibly into the common condition of serfdom. (4) The corresponding change, in the case of the rural slaves, took place through their being merged in the order of *coloni*. The Roman colonus was originally a free person who took land on lease, contracting to pay to the proprietor either a fixed sum annually or (when a *colonus partiarius*) a certain proportion of the produce of the farm. Under the emperors of the 4th century the name designated a cultivator who, though personally free, was attached to the soil, and transmitted his condition to his descendants; and this became the regular status of the mass of Roman cultivators. The class of coloni appears to have been composed partly of tenants by contract who had incurred large arrears of rent and were detained on the estates as debtors (*obaerati*), partly of foreign captives or immigrants who were settled in this condition on the land, and partly of small proprietors and other poor men who voluntarily adopted the status as an improvement in their position. They paid a fixed proportion of the produce (*pars agraria*) to the owner of the estate, and gave a determinate amount of labour (*operae*) on the portion of the domain which he kept in his own hands (*mansus dominicus*). The law for a long time took no notice of these customary tenures, and did not systematically constitute them until the 4th century. It was indeed the requirements of the fiscus and the conscription which impelled the imperial government to regulate the system. The coloni were inscribed (*adscripti*) on the registers of the census as paying taxes to the state, for which the proprietor was responsible, reimbursing himself for the amount. In a constitution of Constantine (A.D. 332) we find the colonus recognized as permanently attached to the land. If he abandoned his holding he was brought back and punished; and any one who received him had not only to restore him but to pay a penalty. He could not marry out of the domain; if he took for wife a colona of another proprietor, she was restored to her original locality, and the offspring of the union were divided between the estates. The children of a colonus were fixed in the same status. They and their descendants were retained, in the words of a law of Theodosius, "quodam aeternitatis jure," and by no process could be relieved from their obligations. By a law of Anastasius, at the end of the 5th century, a colonus who had voluntarily come into an estate was by a tenure of thirty years for ever attached to it. The master (*dominus*) could inflict on his coloni "moderate chastisement," and could chain them if they attempted to escape, but they had a legal remedy against him for unjust demands or injury to them or theirs. In no case could the rent or the labour dues be increased. The colonus could possess property of his own, but could not alienate it without the consent of the master. Thus, whilst the members of the class were personally free, their condition had some incidents of a semi-servile character. They are actually designated by Theodosius, "servi terrae cui nati sunt." And Salvian treats the proposition "coloni divitum fiunt" as equivalent to "vertuntur in servos." This is indeed an exaggeration; the colonatus was not an oppressive system; it afforded real security against unreasonable demands and wanton disturbance, and it was a great advance on the system of the *familia rustica*. But the point which is important is that there was a certain approximation between the condition of the colonus and the slave which tended towards the fusion of both in a single class.

Besides the coloni there were on a great estate—and those of the 4th century were on a specially large scale—a number of praedial slaves, who worked collectively under overseers on the part of the property which the owner himself cultivated. But it was a common practice to settle certain of the slaves (and possibly also of the freedmen) on other portions of the estate, giving them small farms on conditions similar to those to which the coloni were subject. These slaves are, in fact, described by Ulpian as *quasi coloni*. They had their own households and were hence distinguished as *casati*. In law these slaves were at first absolutely at the disposal of their masters; they had no property in the strict sense of the word, and could be sold to another proprietor and separated from their families. But the landlord's interest and the general tone of feeling alike modified practice even before the intervention of legislation; they were habitually continued in their holdings, and came to possess in fact a perpetual and hereditary enjoyment of them. By a law of Valentinian I. (377) the sale of these slaves was interdicted unless the land they occupied were at the same time sold. The legal distinction between the coloni and the slave tenants continued to exist after the invasions; but the practical difference was greatly attenuated. The colonus often occupied a servile mansus, and the slave a mansus originally appropriated to a colonus. Intermarriages of the two classes became frequent. Already at the end of the 7th century it does not appear that the distinction between them had any substantial existence.

The influence of the Northern invasions on the change from slavery to serfdom was, in all probability, of little account. The change would have taken place, though perhaps not so speedily, if they had never occurred. For the developments of the Middle Ages see SERFDOM and VILLENAGE.

Modern Slave Trade.—Not very long after the disappearance of serfdom in the most advanced communities comes into sight the new system of colonial slavery, which, instead of being the spontaneous outgrowth of social necessities and subserving a temporary need of human development, was politically as well as morally a monstrous aberration.

Spanish colonies.

In 1442, when the Portuguese under Prince Henry the Navigator were exploring the Atlantic coast of Africa, one of his officers, Antam Gonsalves, who had captured some Moors, was directed by the prince to carry them back to Africa. He received from the Moors in exchange for them ten blacks and a quantity of gold dust. This excited the cupidity of his fellow-countrymen; and they fitted out a large number of ships for the trade, and built several forts on the African coast. Many negroes were brought into Spain from these Portuguese settlements, and the colonial slave trade first appears in the form of the introduction into the newly-discovered western world of descendants of these negroes. When Nicolas de Ovando was sent out in 1502 as governor of Haiti, whilst regulations, destined to prove illusory, were made for the protection of the natives of the island, permission was given to carry to the colony negro slaves, born in Seville and other parts of Spain, who had been instructed in the Christian faith. It appears from a letter of Ovando in 1503 that there were at that time numbers of negroes in Haiti; he requested that no more might be permitted to be brought out. In 1510 and the following years

King Ferdinand ordered a number of Africans to be sent to that colony for the working of the mines.

Before this time Columbus had proposed an exchange of his Carib prisoners as slaves against live stock to be furnished to Haiti by Spanish merchants. He actually sent home, in 1494, above 500 Indian prisoners taken in wars with the caciques, who, he suggested, might be sold as slaves at Seville. But, after a royal order had been issued for their sale, Queen Isabella, interested by what she had heard of the gentle and hospitable character of the natives and of their docility, procured a letter to be written to Bishop Fonseca, the superintendent of Indian affairs, suspending the order until inquiry should be made into the causes for which they had been made prisoners, and into the lawfulness of their sale. Theologians differed on the latter question, and Isabella directed that these Indians should be sent back to their native country.

Bartolomé de las Casas, the celebrated bishop of Chiapa, accompanied Ovando to Haiti, and was a witness of the cruelties from which the Indians suffered under his administration. He came to Spain in 1517 to obtain measures in their favour, and he then made the suggestion to Charles that each Spanish resident in Haiti should have licence to import a dozen negro slaves. Las Casas, in his *Historia de las Indias* (lib. iii. cap. 101), confesses the error into which he thus fell. Other good men appear to have given similar advice about the same time, and, as has been shown, the practice was not absolutely new; indeed the young king had in 1516, whilst still in Flanders, granted licences to his courtiers for the importation of negroes into the colonies, though Jimenes, as regent of Castile, by a decree of the same year forbade the practice. The suggestion of Las Casas was no doubt made on the ground that the negroes could, better than the Indians, bear the labour in the mines, which was rapidly exhausting the numbers of the latter.[1] He has sometimes on this plea been exonerated from all censure; but, though entitled to honour for the zeal which he showed on behalf of the natives, he must bear the blame for his violation or neglect of moral principle. His advice was unfortunately adopted. "Charles," says Robertson, "granted a patent to one of his Flemish favourites, containing an exclusive right" of supplying 4000 negroes annually to Haiti, Cuba, Jamaica and Porto Rico. "The favourite sold his patent to some Genoese merchants for 25,000 ducats"; these merchants obtained the slaves from the Portuguese; and thus was first systematized the slave trade between Africa and America.

England.

The first Englishman who engaged in the traffic was Sir John Hawkins (*q.v.*). The English slave traders were at first altogether occupied in supplying the Spanish settlements. Indeed the reign of Elizabeth passed without any English colony having been permanently established in America. But in 1620 a Dutch ship from the coast of Guinea visited Jamestown in Virginia, and sold a part of her cargo of negroes to the tobacco-planters. This was the first beginning of slavery in British America; the number of negroes was afterwards continually increased—though apparently at first slowly—by importation, and the field-labour was more and more performed by servile hands, so that in 1790 the state of Virginia contained 200,000 negroes.

The African trade of England was long in the hands of exclusive companies; but by an act of the first year of William and Mary it became free and open to all subjects of the crown. The African Company, however, continued to exist, and obtained from time to time large parliamentary grants. By the treaty of Utrecht the asiento,[2] or contract for supplying the Spanish colonies with 4800 negroes annually, which had previously passed from the Dutch to the French, was transferred to Great Britain; an English company was to enjoy the monopoly for a period of thirty years from 1st May 1713. But the contract came to an end in 1739, when the complaints of the English merchants on one side and of the Spanish officials on the other rose to such a height that Philip V. declared his determination to revoke the asiento, and Sir Robert Walpole was forced by popular feeling into war with Spain. Between 1680 and 1700 about 140,000 negroes were exported by the African Company, and 160,000 more by private adventurers, making a total of 300,000. Between 1700 and the end of 1786 as many as 610,000 were transported to Jamaica alone, which had been an English possession since 1655. Bryan Edwards estimated the total import into all the British colonies of America and the West Indies from 1680 to 1786 at 2,130,000, being an annual average of 20,095. The British slave trade reached its utmost extension shortly before the War of American Independence. It was then carried on principally from Liverpool, but also from London, Bristol and Lancaster: the entire number of slave ships sailing from those ports was 192 and in them space was provided for the transport of 47,146 negroes. During the war the number decreased, but on its termination the trade immediately revived. When Edwards wrote (1791), the number of European factories on the coasts of Africa was 40: of these 14 were English, 3 French, 15 Dutch, 4 Portuguese and 4 Danish. As correct a notion as can be obtained of the numbers annually exported from the continent about the year 1790 by traders of the several European countries engaged in the traffic is supplied by the following statement:—"By the British, 38,000; by the French, 20,000; by the Dutch, 4000; by the Danes, 2000; by the Portuguese, 10,000; total 74,000." Thus more than half the trade was in British hands.

Effects of the slave trade.

The hunting of human beings to make them slaves was greatly aggravated by the demand of the European colonies. The native chiefs engaged in forays, sometimes even on their own subjects, for the purpose of procuring slaves to be exchanged for Western commodities. They often set fire to a village by night and captured the inhabitants when trying to escape. Thus all that was shocking in the barbarism of Africa was multiplied and intensified by this foreign stimulation. Exclusive of the slaves who died before they sailed from Africa, $12\frac{1}{2}$% were lost during their passage to the West Indies; at Jamaica $4\frac{1}{2}$% died whilst in the harbours or before the sale and one-third more in the "seasoning." Thus, out of every lot of 100 shipped from Africa 17 died in about 9 weeks, and not more than 50 lived to be effective labourers in the islands. The circumstances of their subsequent life on the plantations were not favourable to the increase of their numbers. In Jamaica there were in 1690, 40,000; from that year till 1820 there were imported 800,000; yet at the latter date there were only 340,000 in the island. One cause which prevented the natural increase of population was the inequality in the numbers of the sexes; in Jamaica alone there was in 1789 an excess of 30,000 males.

England.

Movement against the Slave Trade.—When the nature of the slave trade began to be understood by the public, all that was best in England was adverse to it. Among those who denounced it—besides some whose names are now little known, but are recorded in the pages of Clarkson—were Baxter, Sir Richard Steele (in *Inkle and Yarico*), the poets Southern (in *Oroonoko*), Pope, Thomson, Shenstone, Dyer, Savage and above all Cowper (see his *Charity*, and *Task*, bk. 2), Thomas Day (author of *Sandford and Merton*), Sterne, Warburton, Hutcheson, Beattie, John Wesley, Whitfield, Adam Smith, Millar, Robertson, Dr Johnson, Paley, Gregory, Gilbert Wakefield, Bishop Porteus, Dean Tucker. The question of the legal existence of slavery in Great Britain and Ireland was raised in consequence of an opinion given in 1729 by Yorke and Talbot, attorney-general and solicitor-general at the time, to the effect that a slave by coming into those countries from the West Indies did not become free, and might be compelled by his master to return to the plantations. Chief-Justice Holt had expressed a contrary opinion; and the matter was brought to a final issue by Granville Sharp in the case of the negro Somerset. It was decided by Lord Mansfield, in the name of the whole bench, on the 22nd of June 1772, that as soon as a slave set his foot on the soil of the British islands he became free. In 1776 it was moved in the House of Commons by David Hartley, son of the author of *Observations on Man*, that "the slave trade was contrary to the laws of God and the rights of men"; but this motion—the first which was made on the subject—failed.

The first persons in England who took united practical action against the slave trade were the Quakers, following the expression of sentiment which had emanated so early as 1671 from their founder George Fox. In 1727 they declared it to be "not a commendable or allowed" practice; in 1761 they excluded from their society all who should be found concerned in it, and issued appeals to their members and the public against the system. In 1783 there was formed among them an association "for the relief and liberation of the negro slaves in the West

[1] The Spaniards, in the space of fifteen years subsequent to the discovery of the West Indies, had, as Robertson mentions, reduced the natives of Haiti from a million to 60,000.

[2] The Spaniards were prevented from forming establishments on the African coast by the Bull of Demarcation ("Inter caetera") of Pope Alexander VI. (1493), which forbade their acquiring territory to the east of the meridian line of 100 m. west of the Azores. They could therefore supply their American possessions with slaves only by contracts with other powers.

Indies, and for the discouragement of the slave trade on the coast of Africa." This was the first society established in England for the purpose. The Quakers in America had taken action on the subject still earlier than those in England. The Pennsylvanian Quakers advised their members against the trade in 1696; in 1754 they issued to their brethren a strong dissuasive against encouraging it in any manner; in 1774 all persons concerned in the traffic, and in 1776 all slave holders who would not emancipate their slaves, were excluded from membership. The Quakers in the other American provinces followed the lead of their brethren in Pennsylvania. The individuals among the American Quakers who laboured most earnestly and indefatigably on behalf of the Africans were John Woolman (1720–1773) and Anthony Benezet (1713–1784), the latter a son of a French Huguenot driven from France by the revocation of the edict of Nantes. The former confined his efforts chiefly to America and indeed to his coreligionists there; the latter sought, not without success, to found a universal propaganda in favour of abolition. A Pennsylvanian society was formed in 1774 by James Pemberton and Dr Benjamin Rush, and in 1787 (after the war) was reconstructed on an enlarged basis under the presidency of Franklin. Other similar associations were founded about the same time in different parts of the United States. The next important movement took place in England. Dr Peckard, vice-chancellor of the university of Cambridge, who entertained strong convictions against the slave trade, proposed in 1785 as subject for a Latin prize dissertation the question, "An liceat invitos in servitutem dare." Thomas Clarkson obtained the first prize, translated his essay into English in an expanded form, and published it in 1786 with the title *Essay on the Slavery and Commerce of the Human Species.* In the process of its publication he was brought into contact with several persons already deeply interested in the question; amongst others with Granville Sharp, William Dillwyn (an American by birth, who had known Benezet), and the Rev. James Ramsay, who had lived nineteen years in St Christopher, and had published an *Essay on the Treatment and Conversion of the African Slaves in the British Sugar Colonies.* The distribution of Clarkson's book led to his forming connexions with many persons of influence, and especially with William Wilberforce (*q.v.*). A committee was formed on the 22nd of May 1787 for the abolition of the slave trade, under the presidency of Granville Sharp. It is unquestionable that the principal motive power which originated and sustained their efforts was Christian principle and feeling. The most earnest and unremitting exertions were made by the persons so associated in investigating facts and collecting evidence, in forming branch committees and procuring petitions, information and support of those who pleaded the cause in parliament. To the original members were afterwards added several remarkable persons, amongst whom were Josiah Wedgwood, Bennet Langton (Dr Johnson's friend), and, later, Zachary Macaulay, Henry Brougham and James Stephen.

In consequence of the numerous petitions presented to parliament, a committee of privy council was appointed by the crown in 1788 to inquire concerning the slave trade; and Pitt moved that the House of Commons should early in the next session take the subject into consideration. Wilberforce's first motion for a committee of the whole House upon the question was made on the 19th of March 1789, and this committee proceeded to business on the 12th of May of the same year. After an admirable speech, Wilberforce laid on the table twelve resolutions which were intended as the basis of a future motion for the abolition of the trade. The discussion of these was postponed to the next session, and in 1790–1791 evidence was taken upon them. At length, on the 18th of April of the latter year, a motion was made for the introduction of a bill to prevent the further importation of slaves into the British colonies in the West Indies. Opinion had been prejudiced by the insurrections in St Domingo and Martinique, and in the British island of Dominica; and the motion was defeated by 163 votes against 88. Legislative sanction was, however, given to the establishment of the Sierra Leone Company, for the colonization of a district on the west coast of Africa and the discouragement of the slave trade there. It was hoped at the time that that place would become the centre from which the civilization of Africa would proceed; but this expectation was not fulfilled. On the 2nd of April 1792 Wilberforce again moved that the trade ought to be abolished; an amendment in favour of gradual abolition was carried, and it was finally resolved that the trade should cease on the 1st of January 1796. When a similar motion was brought forward in the Lords the consideration of it was postponed to the following year, in order to give time for the examination of witnesses by a committee of the House. A bill in the Commons in the following year to abolish that part of the trade by which British merchants supplied foreign settlements with slaves was lost on the third reading; it was renewed in the Commons in 1794 and carried there, but defeated in the Lords. Then followed several years during which efforts were made by the abolitionists in parliament with little success. But in 1806, Lord Grenville and Fox having come into power, a bill was passed in both Houses to put an end to the British slave trade for foreign supply, and to forbid the importation of slaves into the colonies won by the British arms in the course of the war. On the 10th of June of the same year Fox brought forward a resolution "that effectual measures should be taken for the abolition of the African slave trade in such a manner and at such a period as should be deemed advisable," which was carried by a large majority. A similar resolution was successful in the House of Lords. A bill was then passed through both Houses forbidding the employment of any new vessel in the trade. Finally, in 1807, a bill was presented by Lord Grenville in the House of Lords providing for the abolition of the trade, was passed by a large majority, was then sent to the Commons (where it was moved by Lord Howick), was there amended and passed, and received the royal assent on the 25th of March. The bill enacted that no vessel should clear out for slaves from any port within the British dominions after the 1st of May 1807, and that no slave should be landed in the colonies after the 1st of March 1808.

In 1807 the African Institution was formed, with the primary objects of keeping a vigilant watch on the slave traders and procuring, if possible, the abolition of the slave trade by the other European nations. It was also to be made an instrument for promoting the instruction of the negro races and diffusing information respecting the African continent.

The Act of 1807 was habitually violated, as the traders knew that, if one voyage in three was successful, they were abundantly remunerated for their losses. This state of things, it was plain, must continue as long as the trade was only a contraband commerce, involving merely pecuniary penalties. Accordingly, in 1811, Brougham carried through parliament a bill declaring the traffic to be a felony punishable with transportation. Some years later another act was passed, making it a capital offence; but this was afterwards repealed. The law of 1811 proved effectual and brought the slave trade to an end so far as the British dominions were concerned. Mauritius, indeed, continued it for a time. That island, which had been ceded by France in 1810, three years after the abolition, had special facilities for escaping observation in consequence of the proximity of the African coast; but it was soon obliged to conform.

France. The abolition of the French slave trade was preceded by struggles and excesses. The western part of St Domingo, nominally belonging to Spain, had been occupied by buccaneers, who were recognized and supported by the French government, and had been ceded to France at the peace of Ryswick in 1697. So vast was the annual importation of enslaved negroes into this colony before 1791 that the ratio of the blacks to the whites was as 16 to 1. In that year there were in French St Domingo 480,000 blacks, 24,000 mulattoes and only 30,000 whites. The French law for the regulation of slavery in the plantations, known as the *Code Noir* (framed under Louis XIV. in 1685), was humane in its spirit; but we are informed that its provisions were habitually disregarded by the planters, whilst the free mulattoes laboured under serious grievances and were exposed to irritating indignities. A "Société des Amis des Noirs" was formed in Paris in 1788 for the abolition, not only of the slave trade, but of slavery itself. The president was Condorcet, and amongst the members were the duc de la Rochefoucault, the Abbé Gregoire, Brissot, Clavière, Pétion and La Fayette; Mirabeau was an active sympathizer. The great motor of the parallel effort in England was the Christian spirit; in France it was the enthusiasm of humanity which was associated with the revolutionary movement. There were in 1789 a number of mulattoes in Paris, who had come from San Domingo to assert the rights of the people of colour in that colony before the national assembly. The Declaration of the Rights of Man in August 1789 seemed to meet their claims, but in March 1790 the assembly, alarmed by rumours of the discontent and disaffection of the planters in San Domingo, passed a resolution that it had not been intended to comprehend the internal government of the colonies in the constitution framed for the mother country. Vincent Ogé, one of the mulatto delegates in Paris, disgusted at the overthrow of the hopes of his race, returned to San Domingo, and on landing in October 1790 addressed a letter to the governor announcing his intention of taking up arms on behalf of the mulattoes if their wrongs were not redressed. He rose accordingly with a few followers, but was soon defeated and forced to take refuge in the Spanish part of the island. He was afterwards surrendered, tried and sentenced to be broken on the wheel. When the news of this reached Paris, it created a strong feeling against the planters; and on the motion of the Abbé Gregoire it was resolved by the assembly on the 15th of May 1791 "that the people of colour resident in the French colonies, born of free parents, were entitled to, as of right, and should be allowed, the enjoyment of all the privileges of French citizens, and among others those of being eligible to seats both in the parochial and colonial assemblies." On the 23rd of August a rebellion of the negroes broke out in the northern province of San Domingo, and soon extended to the western province, where the mulattoes and blacks combined. Many enormities were committed by the insurgents, and were avenged with scarcely inferior barbarity. The French assembly, fearing the loss of the colony, repealed on the 24th of September the decree of the preceding May. This vacillation put an end to all hope of a reconciliation of parties in the island. Civil commissioners sent out from France quarrelled with the governor and called the revolted negroes to their assistance. The white inhabitants of Cape François were massacred and the city in great part destroyed by fire. The planters now offered their allegiance to Great Britain; and an English force landed in the colony. But it was insufficient to encounter the hostility of the republican troops and the revolted negroes and mulattoes; it suffered from disease, and was obliged to evacuate the island in 1798. On the departure of the British the government remained in the hands of Toussaint l'Ouverture (*q.v.*). Slavery had disappeared; the blacks were employed as hired servants, receiving for their remuneration the third part of the crops they raised; and the population was rapidly rising in civilization and comfort. The whole island was now French, the Spanish portion having been ceded by the treaty of Basel. The wish of Toussaint was that San Domingo should enjoy a practical independence whilst recognizing the sovereignty and exclusive commercial rights of France. The issue of the violent and treacherous conduct of Bonaparte towards the island was that the blacks drove from their soil the forces sent to subdue them, and founded a constitution of their own, which was more than once modified. There can be no doubt that the government of the Restoration, in seeking to obtain possession of the island, had the intention of re-establishing slavery, and even of reopening the slave trade for the purpose of recruiting the diminished population. But Bonaparte abolished that trade during the Hundred Days, though he also failed to win back the people of San Domingo, or, as it was now called by its original name, Haiti, to obedience. The Bourbons, when again restored, could not reintroduce the slave trade; the notion of conquering the island had to be given up; and its independence was formally recognized in 1825 (see HAITI).

Progress of the movement.

England had not been the first European power to abolish the slave trade; that honour belongs to Denmark; a royal order was issued on the 16th of May 1792 that the traffic should cease in the Danish possessions from the end of 1802. The United States had in 1794 forbidden any participation by American subjects in the slave trade to foreign countries; they now prohibited the importation of slaves from Africa into their own dominions. This act was passed on the 2nd of March 1807; it did not, however, come into force till 1st January 1808. At the congress of Vienna (November 1814) the principle was acknowledged that the slave trade should be abolished as soon as possible; but the determination of the limit of time was reserved for separate negotiation between the powers. It had been provided in a treaty between France and Great Britain (May 30, 1814) that no foreigner should in future introduce slaves into the French colonies, and that the trade should be absolutely interdicted to the French themselves after the 1st of June 1819. This postponement of abolition was dictated by the wish to introduce a fresh stock of slaves into Haiti, if that island should be recovered. Bonaparte, as we have seen, abolished the French slave trade during his brief restoration, and this abolition was confirmed at the second peace of Paris on the 20th of November, 1815, but it was not effectually carried out by French legislation until March 1818. In January 1815 Portuguese subjects were prohibited from prosecuting the trade north of the equator, and the term after which the traffic should be everywhere unlawful was fixed to end on the 21st of January 1823, but was afterwards extended to February 1830; England paid £300,000 as a compensation to the Portuguese. A royal decree was issued on the 10th of December 1836 forbidding the export of slaves from any Portuguese possession. But this decree was often violated. It was agreed that the Spanish slave trade should come to an end in 1820, England paying to Spain an indemnification of £400,000. The Dutch trade was closed in 1814; the Swedish had been abolished in 1813. By the peace of Ghent, December 1814, the United States and England mutually bound themselves to do all in their power to extinguish the traffic. It was at once prohibited in several of the South American states when they acquired independence, as in La Plata, Venezuela and Chile. In 1831 and 1833 Great Britain entered into an arrangement with France for a mutual right of search within certain seas, to which most of the other powers acceded; and by the Ashburton treaty (1842) with the United States provision was made for the joint maintenance of squadrons on the west coast of Africa. By all these measures the slave trade, so far as it was carried on under the flags of European nations or for the supply of their colonies, ceased to exist.

Anti-slavery movement.

Meantime another and more radical reform had been in preparation and was already in progress, namely, the abolition of slavery itself in the foreign possessions of the several states of Europe. When the English slave trade had been closed, it was found that the evils of the traffic, as still continued by several other nations, were greatly aggravated. In consequence of the activity of the British cruisers the traders made great efforts to carry as many slaves as possible in every voyage, and practised atrocities to get rid of the slaves when capture was imminent. It was, besides, the interest of the cruisers, who shared the price of the captured slave-ship, rather to allow the slaves to be taken on board than to prevent their being shipped at all. Thrice as great a number of negroes as before, it was said, was exported from Africa, and two-thirds of these were murdered on the high seas. It was found also that the abolition of the British slave trade did not lead to an improved treatment of the negroes in the West Indies. The slaves were overworked now that fresh supplies were stopped, and their numbers rapidly decreased. In 1807 there were in the West Indies 800,000; in 1830 they were reduced to 700,000. It became more and more evident that the evil could be stopped only by abolishing slavery altogether.

An appeal was made by Wilberforce in 1821 to Thomas Fowell Buxton to undertake the conduct of this new question in parliament. An anti-slavery society was established in 1823, the principal members of which, besides Wilberforce and Buxton, were Zachary Macaulay, Dr Lushington and Lord Suffield. Buxton moved on the 5th of May 1823 that the House should take into consideration the state of slavery in the British colonies. The object he and his associates had then in view was gradual abolition by establishing something like a system of serfdom for existing slaves, and passing at the same time a measure emancipating all their children born after a certain day. Canning carried against Buxton and his friends a motion to the effect that the desired ameliorations in the condition and treatment of the slaves should be recommended by the home government to the colonial legislatures, and enforced only in case of their resistance, direct action being taken in the single instance of Trinidad, which, being a crown colony, had no legislature of its own. A well-conceived series of measures of reform was accordingly proposed to the colonial authorities. Thereupon a general outcry was raised by the planters at the acquiescence of the government in the principles of the anti-slavery party. A vain attempt being made in Demerara to conceal from the knowledge of the slaves the arrival of the order in council, they became impressed with the idea that they had been set free. and accordingly refused to work, and, compulsion being resorted to, offered resistance. Martial law was proclaimed; the disturbances were repressed with great severity; and the treatment of the missionary Smith, which was taken up and handled with great ability by Brougham, awakened strong feeling in England against the planters. The question, however, made little progress in parliament for some years, though Buxton, William Smith, Lushington, Brougham, Mackintosh, Butterworth, and Denman, with the aid of Z. Macaulay, James

Stephen, and others, continued the struggle, only suspending it during a period allowed to the local legislatures for carrying into effect the measures expected from them. In 1828 the free people of colour in the colonies were placed on a footing of legal equality with their fellow-citizens. In 1830 the public began to be aroused to a serious prosecution of the main issue. It was becoming plain that the planters would take no steps tending to the future liberation of the slaves, and the leaders of the movement determined to urge the entire abolition of slavery at the earliest practicable period. The government continued to hesitate and to press for mitigations of the existing system. At length in 1833 the ministry of Earl Grey took the question in hand and carried the abolition with little difficulty, the measure passing the House of Commons on the 7th of August 1833 and receiving the Royal assent on the 28th. A sum of 20 millions sterling was voted as compensation to the planters. A system of apprenticeship for seven years was established as a transitional preparation for liberty. The slaves were bound to work for their masters during this period for three-fourths of the day, and were to be liable to corporal punishment if they did not give the due amount of labour. The master was, in return, to supply them with food and clothing. All children under six years of age were to be at once free, and provision was to be made for their religious and moral instruction. Many thought the postponement of emancipation unwise. Immediate liberation was carried out in Antigua, and public tranquillity was so far from being disturbed there that the Christmas of 1833 was the first for twenty years during which martial law was not proclaimed in order to preserve the peace. Notwithstanding protracted and strenuous opposition on the part of the government, the House of Commons passed a resolution against the continuance of the transitional system. When this was done the local legislatures saw that the slaves would no longer work for the masters; they accordingly cut off two years of the indentured apprenticeship, and gave freedom to the slaves in August 1838 instead of 1840.

The example of Great Britain was gradually followed by the other European states, and some American ones had already taken action of the same kind. The immediate emancipation of the slaves in the French colonies was decreed by the provisional government of 1848. In 1858 it was enacted that every slave belonging to a Portuguese subject should be free in twenty years from that date, a system of tutelage being established in the meantime. This law came into operation on the 29th of April 1878, and the status of slavery was thenceforth illegal throughout the Portuguese possessions. The Dutch emancipated their slaves in 1863. Several of the Spanish American states, on declaring their independence, had adopted measures for the discontinuance of slavery within their limits. It was abolished by a decree of the Mexican republic on 15th September 1829. The government of Buenos Aires enacted that all children born to slaves after the 31st of January 1813 should be free; and in Colombia it was provided that those born after the 16th of July 1821 should be liberated on attaining their eighteenth year.

Three of the most important slave systems still remained in which no steps towards emancipation had been taken—those of the Southern United States, of Cuba and of Brazil.

United States.

Slavery was far from being approved in principle by the most eminent of the fathers of the American Union. Washington in his will provided for the emancipation of his own slaves; he said to Jefferson that it was "among his first wishes to see some plan adopted by which slavery in his country might be abolished by law," and again he wrote that to this subject his own suffrage should never be wanting. John Adams declared his abhorrence of the practice of slaveholding, and said that "every measure of prudence ought to be assumed for the eventual total extirpation of slavery from the United States." Franklin's opinions we have already indicated; and Madison, Hamilton, and Patrick Henry all reprobated the principle of the system. Jefferson declared in regard to slavery, "I tremble for my country when I reflect that God is just." The last-named statesman, at the first Continental Congress after the evacuation by the British forces, proposed a draft ordinance (March 1st 1784) for the government of the North-West Territory, in which it was provided that "after the year 1800 there shall be neither slavery nor involuntary servitude in any of the said states, otherwise than in punishment of crime." This proviso, however, was lost; but in the Ordinance of 1787 (13 July) for the government of the territory of the United States north-west of the Ohio river, which was introduced by Nathan Dane and probably drafted by Manasseh Cutler, slavery was forbidden in the Territory. At the convention of Philadelphia in 1787, where the constitution was drafted, the sentiments of the framers were against slavery; but South Carolina and Georgia insisted on its recognition as a condition of their joining the Union, and even an engagement for the mutual rendition of fugitive slaves was embodied in the federal pact. The *words* "slave" and "slavery" were, however, excluded from the constitution, "because," as Madison says, "they did not choose to admit the right of property in man" in direct terms; and it was at the same time provided that Congress might interdict the foreign slave trade after the expiration of twenty years. It must not be forgotten that either before or soon after the formation of the Union the Northern States—beginning with Vermont in 1777, and ending with New Jersey in 1804—either abolished slavery or adopted measures to effect its gradual abolition within their boundaries. But the principal operation of (at least) the latter change was simply to transfer Northern slaves to Southern markets.

We cannot follow in detail the several steps by which the slave power for a long time persistently increased its influence in the Union. The acquisition of Louisiana in 1803, which gave a new field for the growth of the slave power, though not made in its interest, the Missouri Compromise (1820), the annexation of Texas (1845), the Fugitive Slave Law (1850), the Kansas-Nebraska bill (1854), the Dred Scott decision (1857), the attempts to acquire Cuba (especially in 1854) and to reopen the foreign slave trade (1859–1860), were the principal steps—only some of them successful—in its career of aggression. They roused a determined spirit of opposition, founded on deep-seated convictions. The pioneer of the more recent abolitionist movement was Benjamin Lundy (1789–1839). He was followed by William Lloyd Garrison (1805–1879), Elijah P. Lovejoy (1802–1837)—a martyr, if ever there was one—Wendell Phillips, Charles Sumner, John Brown (b. 1800, hanged 1859), all of whom were in their several ways leading apostles or promoters of the cause. The best intellect of America outside the region of practical politics has been on the anti-slavery side. William E. Channing, R. W. Emerson, the poets Bryant, Longfellow, pre-eminently Whittier and Whitman, have spoken on this theme with no uncertain sound. The South, and its partisans in the North, made desperate efforts to prevent the free expression of opinion respecting the institution, and even the Christian churches in the slave states used their influence in favour of the maintenance of slavery. But in spite of every such effort opinion steadily grew. Public sentiment in the North was deeply stirred by the *Uncle Tom's Cabin* (1852) of Mrs Harriet Beecher Stowe, which, as Senior said, under the disguise of a novel was really a pamphlet against the Fugitive Slave Law. It gradually became apparent that the question could not be settled without an armed conflict. The election of Abraham Lincoln as president in November 1860 was the signal for the rising of the South. The North at first took arms simply to maintain the Union; but the far-sighted politicians from the first, and soon the whole nation, saw that the real issue was the continued existence or the total abolition of slavery. (See United States.)

The war was practically closed by the surrender at Appomattox (9th April 1865), but already in 1862 slavery in the Territories had been abolished by Congress; on the 22nd of September of the same year Lincoln (*q.v.*) had issued the preliminary emancipation proclamation, followed on the 1st of January 1863 by the emancipation of all slaves in the states in arms against the Union; and in December 1865 a constitutional amendment was ratified abolishing and forever prohibiting slavery throughout the United States.

Cuba.

The Spanish slave code, promulgated in 1789, is admitted on all hands to have been very humane in its character; and, in consequence of this, after Trinidad had become an English possession, the anti-slavery party resisted—and successfully—the attempt of the planters (1811) to have the Spanish law in that island replaced by the British. But notwithstanding this mildness of the code, its provisions were habitually and glaringly violated in the colonies of Spain, and in Cuba particularly the conditions of slavery were very bad. The slave population of the island was estimated in 1792 at 84,000; in 1817 at 179,000; in 1827 at 286,000; and in 1843 at 436,000. An act was passed by the Spanish legislature in 1870, providing that every slave who had then passed, or should thereafter pass, the age of sixty should be at once free, and that all yet unborn children of slaves should also be free. The latter, however, were to be maintained at the expense of the proprietors up to their eighteenth year, and during that time to be kept, as apprentices, to such work as was suitable for their age. This was known as the Moret Law, having been carried through the house of representatives by Señor Moret y Prendergast, then minister for the colonies. By the census of 1867 there was in Cuba a total population of 1,370,211 persons, of whom 764,750 were whites and 605,461 black or coloured; and of the latter number 225,938 were free and 379,523 were slaves. In 1873 the Cubans roughly estimated the population at 1,500,000—of whom 500,000, or one-third, were slaves. Mr Crowe, consul-general in the island, in 1885, stated that "the institution was rapidly dying,—that in a year, or at most two, slavery, even in its then mild form, would be extinct."

Brazil. There was a convention between Great Britain and Brazil in 1826 for the abolition of the slave trade, but it was habitually violated in spite of the English cruisers. In 1830 the traffic was declared piracy by the emperor of Brazil. England asserted by the Aberdeen Act (1845) the right of seizing suspected craft in Brazilian waters. Yet by the connivance of the local administrative authorities 54,000 Africans continued to be annually imported. In 1850 the trade is said to have been decisively put down. The planters and mine proprietors cried out against this as a national calamity. The closing of the traffic made the labour of the slaves more severe, and led to the employment on the plantations of many who before had been engaged in domestic work; but the slavery of Brazil had always been lighter than that of the United States. On 28th September 1871 the Brazilian chambers decreed that slavery should be abolished throughout the empire. Though existing slaves were to remain slaves still, with the exception of those possessed by the government, who were liberated by the act, facilities for emancipation were given; and it was provided that all children born of female slaves after the day on which the law passed should be free. They were, however, bound to serve the owners of their mothers for a term of 21 years. A clause was inserted to the effect that a certain sum should be annually set aside from fines to aid each province in emancipating slaves by purchase. Seven years before the passing of this act the emperor, whose influence had always been exerted in favour of freedom, had liberated his private slaves, and many Brazilians after 1871 followed his example. Finally, in 1888 the chambers decreed the total abolition of slavery, some 700,000 persons being accordingly freed.

Disguised slave trade. In the colonies of more than one European country, after the prohibition of the slave trade, attempts were made to replace it by a system of importing labourers of the inferior races under contracts for a somewhat lengthened term; and this was in several instances found to degenerate into a sort of legalized slave traffic. About 1867 we began to hear of a system of this kind which was in operation between the South Sea Islands and New Caledonia and the white settlements in Fiji. It seems to have begun in really voluntary agreements; but for these the unscrupulous greed of the traders soon substituted methods of fraud and violence. The natives were decoyed into the labour ships under false pretences, and then detained by force; or they were seized on shore or in their canoes and carried on board. The nature of the engagements to go and work on the plantations was not fully explained to them, and they were hired for periods exceeding the legal term. The area of this trade was ere long further extended. In 1884 attention was drawn in a special degree to the Queensland traffic in Pacific Islanders by the "Hopeful" trials, and a government commission was appointed to inquire into the methods followed by labour ships in recruiting the natives of New Guinea, the Louisiade Archipelago, and the D'Entrecasteaux group of islands. The result of the investigations, during which nearly five hundred witnesses were examined, was the disclosure of a system which in treachery and atrocity was little inferior to the old African slave trade. These shameful deeds made the islanders regard it as a duty to avenge their wrongs on any white men they could entice upon their shores. The bishop of Melanesia, John Coleridge Patteson, fell a victim to this retaliation on the island of Nukapu 20th September 1871.

We have seen that the last vestiges of the monstrous anomaly of modern colonial slavery are disappearing from all civilized states and their foreign possessions. It now remains to consider the slavery of primitive origin which has existed within recent times, or continues to exist, outside of the Western world.

Russian serfdom. In Russia, a country which had not the same historical antecedents with the Western nations, properly so called, and which is in fact more correctly classed as Eastern, whilst slavery had disappeared, serfdom was in force down to our own days. The rural population of that country, at the earliest period accessible to our inquiries, consisted of (1) slaves, (2) free agricultural labourers, and (3) peasants proper, who were small farmers or cottiers and members of a commune. The sources of slavery were there, as elsewhere, capture in war, voluntary sale by poor freemen of themselves, sale of insolvent debtors, and the action of the law in certain criminal cases. In the 18th century we find the distinction between the three classes named above effaced and all of them merged in the class of serfs, who were the property either of the landed proprietors or of the state. They were not even *adscripti glebae*, though forbidden to migrate; an imperial ukase of 1721 says, "the proprietors sell their peasants and domestic servants, not even in families, but one by one, like cattle." This practice, at first tacitly sanctioned by the government, which received dues on the sales, was at length formally recognized by several imperial ukases. Peter the Great imposed a poll-tax on all the members of the rural population, making the proprietors responsible for the tax charged on their serfs; and the "free wandering people" who were not willing to enter the army were required to settle on the land either as members of a commune or as serfs of some proprietor. The system of serfdom attained its fullest development in the reign of Catherine II. The serfs were bought, sold, and given in presents, sometimes with the land, sometimes without it, sometimes in families and sometimes individually, sale by public auction being alone forbidden, as "unbecoming in a European state." The proprietors could transport without trial their unruly serfs to Siberia or send them to the mines for life, and those who presented complaints against their masters were punished with the knout and condemned to the mines. The first symptoms of a reaction appear in the reign of Paul (1796–1801). He issued an ukase that the serfs should not be forced to work for their masters more than three days in each week. There were several feeble attempts at further reform, and even abortive projects of emancipation, from the commencement of the 19th century. But no decisive measures were taken before the accession of Alexander II. (1855). That emperor, after the Crimean War, created a secret committee composed of the great officers of state, called the chief committee for peasant affairs, to study the subject of serf-emancipation. Of this body the grand-duke Constantine was an energetic member. To accelerate the proceedings of the committee advantage was taken of the following incident. In the Lithuanian provinces the relations of the masters and serfs were regulated in the time of Nicholas by what were called inventories. The nobles, dissatisfied with these, now sought to have them revised. The government interpreted the application as implying a wish for the abolition of serfdom, and issued a rescript authorizing the formation of committees to prepare definite proposals for a gradual emancipation. A circular was soon after sent to the governors and marshals of the nobility all over Russia proper, informing them of this desire of the Lithuanian nobles, and setting out the fundamental principles which should be observed "if the nobles of the provinces should express a similar desire." Public opinion strongly favoured the projected reform; and even the masters who were opposed to it saw that, if the operation became necessary, it would be more safely for their interests intrusted to the nobles than to the bureaucracy. Accordingly during 1858 a committee was created in nearly every province in which serfdom existed. From the schemes prepared by these committees, a general plan had to be elaborated, and the government appointed a special imperial commission for this purpose. The plan was formed, and, in spite of some opposition from the nobles, which was suppressed, it became law, and serfdom was abolished (19th February = 3rd March 1861). (See RUSSIA.) The total number of serfs belonging to proprietors at the time of the emancipation was 21,625,609, of whom 20,158,231 were peasant serfs and 1,467,378 domestic serfs. This number does not include the state serfs, who formed about one-half of the rural population. Their position had been better, as a rule, than that of the serfs on private estates; it might indeed, Mr (afterwards Sir) R. D. M. Wallace says, be regarded as "an intermediate position between serfage and freedom." Amongst them were the serfs on the lands formerly belonging to the church, which had been secularized and transformed into state demesnes by Catherine II. There were also serfs on the apanages affected to the use of the imperial family; these amounted to nearly three and a half millions. Thus by the law of 1861 more than forty millions of serfs were emancipated.

Mahommedan slavery. The slavery of the Mahommedan East is usually not the slavery of the field but of the household. The slave is a member of the family, and is treated with tenderness and affection. The Koran breathes a considerate and kindly spirit towards the class, and encourages manumission. The child of a slave girl by her master is born free, and the mother is usually raised to be a free wife. The traffic in slaves has been repeatedly declared by the Ottoman Porte to be illegal throughout its dominions, and a law for its suppression was published in 1889, but it cannot be said to be extinct, owing to the laxity and too often the complicity of the government officials. In Egypt it has practically died out.

Africa. In the days of the colonial slave trade its African centre was the region about the mouths of the rivers Calabar and Bonny, whither the captive negroes were brought from great distances in the interior. As many slaves, Clarkson tells us, came annually from this part of the coast as from all the rest of Africa besides. The principal centres from which the supply was furnished to Egypt, Turkey, Arabia, and Persia were three in number. (1) The central Sudan appeared to be one vast hunting-ground. Captives were brought thence to the slave market of Kuka in Bornu, where, after being bought by dealers, they were, to the number of about 10,000 annually, marched across the Sahara to Murzuk in Fezzan, from which place they were distributed to the northern and eastern Mediterranean coasts. Their sufferings on the route were dreadful; many succumbed and were abandoned. Rohlfs informs us that "any one who did not know the way" by which the caravans passed "would only have to follow the bones which lie right and left of the track." Negroes were also brought to Morocco from the Western Sudan and from Timbuktu. The centre of the traffic in Morocco was Sidi Hamed ibn Musa, seven days' journey south of Mogador, where a great yearly fair was held. The slaves were forwarded thence in gangs to different towns, especially to Marrakesh, Fez and Mequinez. About 4000 were thus annually imported, and an *ad valorem* duty was levied by the sultan, which produced about £4800 of annual revenue. The control now exercised by the French over the greater part of the western Sudan has deprived Morocco of its chief sources of supply. Slavery, however, still flourishes in that empire. (2) The basin of the Upper Nile, extending to the great lakes, was another region infested by the slave trade; the slaves were either smuggled into Egypt or sent by the Red Sea to Turkey. The khedive Ismail in 1869 appointed Sir Samuel Baker to the command of a large force with which he was "to strike a direct blow at the slave trade in its distant nest." The work begun by him was continued by Colonel C. G. Gordon (1874 to 1879), but under the Mahdi and the Khalifa the slave trade was revived. Since the reconquest of the eastern Sudan by an Anglo-Egyptian force in 1898 effective measures have been taken to suppress slave raiding and as far as possible slavery itself. The conquest of the central Sudan states by France—completed in 1910 by the subjugation of Wadai—has practically ended the caravan trade in slaves across the Sahara. (3) There was for long a slave trade from the Portuguese possessions on the East African coast. The stream of supply came mainly from the southern Nyasa districts by three or four routes to Ibo, Mozambique, Angoche and Quilimane. Madagascar and the Comoro Islands obtained most of their slaves from the Mozambique coast. It was believed in 1862 that about 19,000 passed every year from the Nyasa regions to Zanzibar, whence large supplies were drawn for the markets of Arabia and Persia up to 1873. The mission of Sir Bartle Frere to the sultan of Zanzibar in 1873 brought about a treaty for the suppression of the slave trade. It is said that, whereas 10,000 slaves formerly passed the southern end of the Nyasa every year, in 1876 not more than 38 were known to have been conveyed by that route. Lieutenant O'Neill, British consul at Mozambique, writing in 1880, fixed at about 3000 the number then annually exported from the coast between the rivers Rovuma and Zambesi. With the establishment of a British protectorate at Zanzibar, and of British and German protectorates on the mainland of East Africa and in the region of the head-waters of the Nile, the East African slave trade received its death-blow. Slavery itself has been abolished in the Zanzibar, British, German and Portuguese dominions, and had ceased in Madagascar even before its conquest by the French. The complete control of the seaboard by European powers has rendered the smuggling of slaves to Arabia and Persia a difficult and dangerous occupation.

A new era was opened up by the discovery of the course of the Congo by H. M. Stanley, the founding of the Congo Free State by Leopold II. of Belgium and the partition of the greater part of Africa between various European powers. Though the history of the Congo Free State affords a painful contrast to the philanthropic professions of its founder, in other parts of the continent the establishment of protectorates by Great Britain, France and Germany was followed by strenuous, and largely successful, efforts to put down slave raiding. In parts where European authority remained weak, as in the hinterland of the Portuguese province of Angola and the adjacent regions of Central Africa, native potentates continued to raid their neighbours, and from this region many labourers were (up to 1910) forcibly taken to work on the cocoa plantation in St Thomas (*q.v.*). With the accession of Albert I. to the Belgian throne in 1909 a serious endeavour was made to improve the state of affairs in the Congo. At the close of the first decade of the 20th century it might be said that over the greater part of Africa slave raiding was a thing of the past.

Clarkson first, and Buxton afterwards, whilst they urged all other means for the suppression or discouragement of the slave trade and slavery, saw clearly that the only thoroughly effectual method would be the development of legitimate commerce in Africa itself. When Buxton published in 1840 his book entitled *The Slave Trade and its Remedy*, this was the remedy he contemplated. The unfortunate Niger expedition of 1841 was directed to similar ends; and it has been more and more felt by all who were interested in the subject that here lies the radical solution of the great problem. It was for some time thought that from Sierra Leone as a centre industry and civilization might be diffused amongst the nations of the continent; and in 1822 the colony (which in 1847 became the independent republic) of Liberia had been founded by Americans with a similar object; but in neither case have these expectations been adequately fulfilled.

BIBLIOGRAPHY.—On the several branches of the subject of slavery and serfdom information may be obtained from the following works:—

On Ancient Slavery: H. Wallon, *Histoire de l'esclavage dans l'antiquité* (3 vols., 1847; 2nd ed., 1879); A. Boeckh, *Public Economy of Athens*, Eng. trans. by G. Cornewall Lewis (1828; 2nd ed., 1842); William Blair, *Inquiry into the State of Slavery among the Romans, from the Earliest Period to the Establishment of the Lombards in Italy* (1833); Dureau de la Malle, *Économie politique des Romains* (2 vols., 1840); M. Troplong, *De l'influence du Christianisme sur le droit civil des Romains* (2nd ed., 1855); Ebeling, *Die Sklaverei von den ältesten Zeiten bis auf die Gegenwart* (Paderborn, 1889); W. W. Buckland, *The Roman Law of Slavery* (Cambridge, 1909); A. Calderini, *La Manomissione dei liberti in Grecia* (Milan, 1908).

On Medieval Slavery and Serfdom: G. Humbert, article "Colonat" in the *Dictionnaire des antiquités grecques et romaines* of Daremberg and Saglio; J. Yanoski, *De l'abolition de l'esclavage ancien au moyen âge et de sa transformation en servitude de la glèbe* (Wallon and Yanoski had jointly composed a memoir to compete for a prize offered by the Academy of Moral and Political Sciences in 1837; Wallon's portion of the memoir became the foundation of his *Histoire de l'esclavage dans l'antiquité* above mentioned; Yanoski's part, the expansion of which was prevented by his early death, was posthumously published in 1860; it is no more than a slight sketch); Benjamin Guérard, *Prolégomènes au Polyptyque d'Irminon* (1844); Fustel de Coulanges, *Histoire des institutions politiques de l'ancienne France* (2nd ed., 1877), and *Recherches sur quelques problèmes d'histoire* (1885) (the latter work contains an admirable discussion of the whole subject of the *colonatus*, founded throughout on the original texts); Stubbs, *Constitutional History of England* (3 vols., 1874–1878). On the Colonial Slave Trade and Slavery: Washington Irving, *Life and Voyages of Christopher Columbus* (1828), several times reprinted; Arthur Helps, *Life of Las Casas* (1868); Bryan Edwards, *History, Civil and Commercial, of the British West Indies* (1793; 5th ed. in 5 vols., 1819); Thomas Clarkson, *History of the Rise, Progress, and Accomplishment of the Abolition of the African Slave Trade by the British Parliament* (2 vols., 1808); T. Fowell Buxton, *African Slave Trade* (2nd ed., 1838), and *The Remedy, a Sequel* (1840); *Memoirs of Sir T. F. Buxton*, edited by his son Charles Buxton (3rd ed., 1849). On North American Slavery: G. M. Stroud, *Laws relating to Slavery in America* (2nd ed., 1856); H. Greeley, *The American Conflict* (1865); John E. Cairnes, *The Slave Power, its Character, Career, and Probable Designs* (1862; 2nd ed., 1863); H. Wilson, *History of the Rise and Fall of the Slave Power in America* (Boston, 1872); *Johns Hopkins University Studies in Historical and Political Science* (Baltimore, 1889–1902); Du Bois, *Suppression of the African Slave Trade to the United States* (New York, 1896); Merriam, *The Negro and the Nation* (New York, 1906); Sir H. H. Johnston, *The Negro in the New World* (London, 1910); Ballagh, *A History of Slavery in Virginia* (Baltimore, 1902); B. B. Munford, *Virginia's Attitude toward Slavery* (London, 1909), and A. Johnston, *History of American Politics* (New York, 4th ed., 1898); H. E. von Holst, *The Constitutional and Political History of the United States* (Chicago, 1899). On Brazilian: Fletcher and Kidder, *Brazil and the Brazilians* (9th ed., 1879). On Russian Serfdom: D. Mackenzie Wallace, *Russia* (1877). For the African slave trade, and Egyptian and Turkish slavery, the *Ismailia* of Sir S. Baker, the writings of Livingstone, and the biographies of Gordon may be consulted, besides the many documents on these subjects published by the British and Foreign Anti-Slavery Society. There are two volumes by A. Tourmagne, entitled respectively *Histoire de l'esclavage ancien et moderne* (1880) and *Histoire du servage ancien et moderne* (1879), which bring together many facts relating to slavery and serfdom; but they are somewhat loose and uncritical; the author, too, repeats himself much, and dwells on many topics scarcely if at all connected with his main themes; see also H. J. Nieboer, *Slavery as an Industrial System* (The Hague, 1900); W. H. Smith, *Political History of Slavery* (London, 1903). The largest and most philosophical views on slavery generally will be found in Hume's essay "On the Populousness of Antient Nations," and in Comte's *Philosophie positive*, vol. v., and *Politique positive*, vol. iii. For its economic effects, when it is regarded as an organization of labour, reference may be had to Smith's *Wealth of Nations*, book iii. chap. 2, J. S. Mill's *Political Economy*, book ii. chap. 5, and J. E. Cairnes's *Slave Power*, chap. 2. (J. K. I.; X.)

SLAVONIC, OLD. In the article SLAVS (under *Languages*) will be found a fairly complete account of Old Slavonic in its first form, as it is taken as representing, save for a few peculiarities noticed in their place, the Proto-Slavonic. The reasons are there given for believing it to be the dialect of Slavs settled somewhere between Thessalonica and Constantinople and represented now by the Bulgarians and Macedonians.

After the language had been fixed by the original translations of the New Testament and other Church books it was no more consciously adapted to the dialects of the various peoples, but was used equally among the Croats (whose books were accommodated to the Roman use and written in Glagolitic), Serbs and

Russians. These insensibly altered them to make the words easier and allowed their native languages to show through; and the same was the case with the Bulgarians, whose language soon began to lose some of the characteristics of O.S. Hence our earliest MSS. already show departure from the norm which can be established by comparison; about a dozen (8 Glagolitic) MSS. and fragments afford trustworthy material dating from the 10th and 11th centuries, but even then the S. Slavs were weak in distinguishing *i* and *y*, the Russians mixed up *ą* with *u*, *ę* with *ja* and so on; but in the actual texts great conservatism prevailed, whereas any additions, such as colophons or marks of ownership, betray the dialect of the writer more clearly, and such scraps and a few deeds are our earliest authorities for Servian and Russian. But the Church language as insensibly modified continued to be the literary language of Croatia until the 16th century, of Russia until 1700, and of Bulgaria, Servia and Rumania until the early part of the 19th century, and is still the liturgical language of Dalmatia, the Balkans, Russia and the Ruthenian Uniates.

Its literature was enriched in the second generation by the works of Clement, bishop of Ochrida, and John, exarch of Bulgaria, and other writers of the time of Tsar Simeon, but it is almost all ecclesiastical in character. Perhaps the most interesting book in Church Slavonic is the Russian chronicle, but that has many old Russian forms. Otherwise certain translations of Greek Apocrypha are of importance, especially when the Greek original is lost, *e.g.* the Book of Enoch; other Apocrypha in Church Slavonic are said to have been written by Jeremias, a Bogomil priest, but they are probably derived from Eastern sources. The Slavonic text of the Bible is not of importance for textual criticism, as the translation was made late, and even so has never been studied from that point of view. The whole Bible was not finished till the 15th century, some of the less necessary books being translated from the Vulgate.

SLAVS. Judged by the language test, and no other is readily available, the Slavs are the most numerous race in Europe, amounting to some 140,000,000 souls. Outside Europe there are the Russians in Siberia, a mere extension of the main body, and a large number of emigrants settled in America, where, however, although most of the nationalities have their own newspapers, the second generation of immigrants tends to be assimilated.

Divisions and Distribution.—The Slavs are divided geographically into three main groups, Eastern, North-Western and Southern; linguistically also the same division is convenient.

The Russians stand by themselves as the Eastern group. They hold all the East European plain from the 27th meridian to the Urals, the Finnish and Tatar tribes making up but a small proportion of the population: beyond these limits to the east they stretch into central Siberia and thence in narrow bands along the rivers all the way to the Pacific; on the west the Ruthenians (*q.v.*) of Galicia form a wedge between the Poles and the Magyars and almost touch the 20th meridian. The Russians must number 100,000,000.

The North-Western group includes the Poles, about 15,000,000, in the basin of the Vistula; the Kashubes (*q.v.*), about 200,000, on the coast north-west of Danzig; the High and Low Sorbs (*q.v.*) or Wends in Lusatia, 180,000 Slavs completely surrounded by Germans; the Čechs (Czech, *q.v.*) in the square of Bohemia, making up with their eastern neighbours, the Moravians, a people of 6,000,000 in northern Austria surrounded on three sides by Germans. In the north of Hungary, connecting up Ruthenians, Poles and Moravians, but most closely akin to the latter, are 2,500,000 Slovaks (*q.v.*). With the Sorbs, Poles and Kashubes are to be classed the now teutonized Slavs of central Germany, who once stretched as far to the north-west as Rügen and Holstein and to the south-west to the Saale. They are generally called Polabs (*q. v.*), or Slavs on the Elbe, as their last survivors were found on that river in the eastern corner of Hanover.

The Southern Slavs, Slovenes (*q.v.*), Serbo-Croats (see SERVIA) and Bulgarians (see BULGARIA), are cut off from the main body by the Germans of Austria proper and the Magyars, both of whom occupy soil once Slavonic, and have absorbed much Slavonic blood, and by the Rumanians of Transylvania and the Lower Danube, who represent the original Dacians romanized. These Slavs occupy the main mass of the Balkan Peninsula downwards from the Julian Alps and the line of the Muhr, Drave and Danube. North of this all three races have considerable settlements in southern Hungary. Their southern boundary is very ill-defined, various nationalities being closely intermingled. To the south-west the Slavs march with the Albanians, to the south-east with the Turks, and to the south and along the Aegean coasts they have the Greeks as neighbours.

Although the Southern Slavs fall into these three divisions, linguistically the separation is not sharp, nor does it coincide with the political frontiers. Roughly speaking, the eastern half of the peninsula is held by the Bulgarians, some 5,000,000 in number, the western half by the Serbo-Croats, of whom there must be about 8,000,000. This is the most divided of the Slavonic races; its members profess three forms of religion and use three alphabets—the Serbs and Bosnians being mostly Orthodox and using the Cyrillic alphabet, but including many Mussulmans; the Croats being Roman Catholics, writing with Latin letters; and the Dalmatians also Roman Catholics, but using, some of them, the ancient Glagolitic script for their Slavonic liturgy. The language also falls into three dialects independent of the religions, and across all these lines run the frontiers of the political divisions—the kingdom of Servia (more correctly written *Serbia*); the kingdom of Montenegro; the Turkish provinces of Old Servia and Novibazar, still in Turkish hands; those of Bosnia and Herzegovina, annexed by Austria; the coast-line and islands of Istria and Dalmatia, which also form part of Austria; and the kingdom of Croatia, which is included in the dominion of Hungary, to say nothing of outlying colonies in Hungary itself and in Italy. In the extreme north-west, in Carniola, in the southern parts of Styria and Carinthia, and over the Italian border in the province of Udine and the Vale of Resia live the Slovenes, something under 1,500,000, much divided dialectically. Between the Slovenes and the Croats there are transition dialects, and about 1840 there was an attempt (Illyrism) to establish a common literary language. In Macedonia and along the border are special varieties of Bulgarian, some of which approach Servian. Akin to the Macedonians were the Slavs, who once occupied the whole of Greece and left traces in the place-names, though they long ago disappeared among the older population. Akin to the Slovenes were the old inhabitants of Austria and south-west Hungary before the intrusion of the Germans and Magyars.

History.—This distribution of the Slavs can be accounted for historically. In spite of traditions (*e.g.* the first Russian chronicle of Pseudo-Nestor) which bring them from the basin of the Danube, most evidence goes to show that when they formed one people they were settled to the north-east of the Carpathians in the basins of the Vistula, Pripet and Upper Dněstr (Dniester). To the N. they had their nearest relatives, the ancestors of the Baltic tribes, Prussians, Lithuanians and Letts; to the E. Finns; to the S.E. the Iranian population of the Steppes of Scythia (*q.v.*); to the S.W., on the other side of the Carpathians, various Thracian tribes; to the N.W. the Germans; between the Germans and Thracians they seem to have had some contact with the Celts, but this was not the first state of things, as the Illyrians, Greeks and Italians probably came between. This location, arrived at by a comparison of the fragmentary accounts of Slavonic migrations and their distribution in historic time, is confirmed by its agreement with the place taken by the Slavonic language among the other Indo-European languages (see below), and by what we know of the place-names of eastern Europe, in that for this area they seem exclusively Slavonic, outside it the oldest names belong to other languages. The archaeological evidence is not yet cleared up, as, for the period we have to consider, the late neolithic and early bronze age, the region above defined is divided between three different cultures, represented by the fields of urns in Lusatia and Silesia, cist graves with cremation in Poland, and the poor and little-known graves of the Dněpr

(Dnieper) basin. This variety may to some extent be due to the various cultural influences to which the same race was exposed, the western division lying on the route between the Baltic and Mediterranean, the central being quite inaccessible, the eastern part in time showing in its graves the influence of the Steppe people and the Greek colonies in Scythia. There is a gradual transition to cemeteries with Roman objects which shade off into such as are certainly Slavonic.

The physical type of the Slavs is not sufficiently clear to help in throwing light upon the past of the race. Most of the modern Slavs are rather short-headed, the Balkan Slavs being tall and dark, those of central Europe dark and of medium height, the Russians on the whole rather short though the White and Little Russians are of medium height; in complexion the southern Russians are dark, the northern light, but with less decided colour than fair western Europeans. In spite of the prevalent brachycephaly of the modern Slavs, measurements of skulls from cemeteries and ancient graves which are certainly Slavonic have shown, against all expectation, that the farther back we go the greater is the proportion of long heads, and the race appears to have been originally dolichocephalic and osteologically indistinguishable from its German, Baltic and Finnish neighbours. In its present seats it must have assimilated foreign elements, German and Celtic in central Europe, Finnish and Turkish in Great and Little Russia, all these together with Thracian and Illyrian in the Balkans; but how much the differences between the various Slavonic nations are due to admixture, how much to their new homes, has not been made clear.

In spite of the vast area which the Slavs have occupied in historic times there is no reason to claim for them before the migrations a wider homeland than that above defined beyond the Carpathians; given favourable circumstances a nation multiplies so fast (*e.g.* the Anglo-Saxons in the last hundred and twenty years) that we can set no limits to the area that a comparatively small race could cover in the course of four centuries. Therefore the mere necessity of providing them with ancestors sufficiently numerous does not compel us to seek for the Slavs among any of the populous nations of the ancient world. Various investigators have seen Slavs in Scythians, Sarmatians, Thracians, Illyrians, and in fact in almost all the barbarous tribes which have been mentioned in the east of Europe, but we can refer most of such tribes to their real affinities much better than the ancients, and at any rate we can be sure that none of these were Slavs.

There is no evidence that the Slavs made any considerable migration from their first home until the 1st century A.D. Their first Transcarpathian seat lay singularly remote from the knowledge of the Mediterranean peoples. Herodotus (iv. 17, 51, 105) does seem to mention the Slavs under the name of Neuri (*q.v.*), at least the Neuri on the upper waters of the Dněstr are in the right place for Slavs, and their lycanthropy suggests modern Slavonic superstitions; so we are justified in equating Neuri and Slavs, though we have no direct statement of their identity. Other classical writers down to and including Strabo tell us nothing of eastern Europe beyond the immediate neighbourhood of the Euxine.

Pliny (*N.H.* iv. 97) is the first to give the Slavs a name which can leave us in no doubt. He speaks of the *Venedi* (cf. Tacitus, *Germania*, 46, *Veneti*); Ptolemy (*Geog.* iii. 5. 7, 8) calls them *Venedae* and puts them along the Vistula and by the Venedic gulf, by which he seems to mean the Gulf of Danzig: he also speaks of the Venedic mountains to the south of the sources of the Vistula, that is, probably the northern Carpathians. The name Venedae is clearly Wend, the name that the Germans have always applied to the Slavs. Its meaning is unknown. It has been the cause of much confusion because of the Armorican Veneti, the Paphlagonian Enetae, and above all the Enetae-Venetae at the head of the Adriatic. Enthusiasts have set all of these down as Slavs, and the last with some show of reason, as nowadays we have Slovenes just north of Venice. However, inscriptions in the Venetian language are sufficient to prove that it was not Slavonic. Other names in Ptolemy which almost certainly denote Slavonic tribes are the Veltae on the Baltic, ancestors of the Wiltzi, a division of the Polabs (*q.v.*), the Sulani and the Saboci, whose name is a Slavonic translation of the Transmontani of another source.

Unless we are to conjecture Stlavani for Ptolemy's Stavani, or to insist on the resemblance of his Suobeni to Slovene, the name Slav first occurs in Pseudo-Caesarius (*Dialogues*, ii. 110; Migne, *P.G.* xxxviii. 985, early 6th century), but the earliest definite account of them under that name is given by Jordanes (*Getica*, v. 34, 35, *c.* 550 A.D.): *Dacia . . . ad coronae speciem arduis Alpibus emunita, iuxta quorum sinistrum latus, qui in aquilone vergit, ab ortu Vistulae fluminis per immensa spatia Venetharum populosa natio consedit. Quorum nomina licet nunc per varias familias et loca mutentur, principaliter tamen Sclaveni et Antes nominantur. Sclaveni a civitate Novietunense* (Noviodunum, Isakča on the Danube Delta) . . . *usque ad Danastrum et in boream Viscla tenus commorantur . . . Antes vero, qui sunt eorum fortissimi, qua Ponticum mare curvatur a Danastro extenduntur usque ad Danaprum*; cf. xxiii. 119, where these tribes are said to form part of the dominions of Hermanrich. *Sclaveni*, or something like it, has been the regular name for the Slavs from that day to this. The native form is *Slověne*; in some cases, *e.g.* in modern Russian under foreign influence, we have an *a* instead of the *o*. The combination *sl* was difficult to the Greeks and Romans and they inserted *t*, *th* or most commonly *c*, which continues to crop up. So too in Arabic *Saqaliba*, *Saqlâb*. The name has been derived from *slovo*, a word, or *slava*, glory, either directly or through the *-slav* which forms the second element in so many Slavonic proper names, but no explanation is satisfactory. The word " slave " and its cognates in most European languages date from the time when the Germans supplied the slave-markets of Europe with Slavonic captives. The name *Antes* we find applied to the Eastern Slavs by Jordanes; it may be another form of Wend. *Antae* is used by Procopius (*B.G.* iii. 14). He likewise distinguishes them from the Sclaveni, but says that both spoke the same language and both were formerly called Spori, which has been identified with Serb, the racial name now surviving in Lusatia and Servia. Elsewhere he speaks of the measureless tribes of the Antae; this appellation is used by the Byzantines until the middle of the 7th century.

The sudden appearance in the 6th-century writers of definite names for the Slavs and their divisions means that by then the race had made itself familiar to the Graeco-Roman world, that it had spread well beyond its original narrow limits, and had some time before come into contact with civilisation. This may have been going on since the 1st century A.D., and evidence of it has been seen in the southward movement of the Costoboci into northern Dacia (Ptolemy) and of the Carpi to the Danube (A.D. 200), but their Slavonic character is not established. A few ancient names on the Danube, notably that of the river Tsierna (*Černa*, black), have a Slavonic look, but a coincidence is quite possible. The gradual spread of the Slavs was masked by the wholesale migrations of the Goths, who for two centuries lorded it over the Slavs, at first on the Vistula and then in south Russia. We hear more of their movements because they were more immediately threatening for the Empire. In dealing with Ptolemy's location of the Goths and Slavs we must regard the former as superimposed upon the latter and occupying the same territories. This domination of the Goths was of enormous importance in the development of the Slavs. By this we may explain the presence of a large number of Germanic loan words common to all the Slavonic languages, many of them words of cultural significance. " King, penny, house, loaf, earring " all appear in Slavonic; the words must have come from the Goths and prove their strong influence, although the things must have been familiar before. On the other hand " plough " is said to be Slavonic, but that is not certain. When the Huns succeeded the Goths as masters of central Europe, they probably made the Slavs supply them with contingents. Indeed their easy victory may have been due to the dissatisfaction of the Slavs. Priscus (Müller, *F.H.G.* iv. p. 69, cf. Jord. *Get.* xlix. 258) in his account of the camp of Attila mentions words which may be Slavonic, but have also been explained from German. After the fall of the Hunnish power the Eastern Goths and Gepidae pressed southwards and westwards to the conquest of the Empire, and the Lombards and Heruli followed in their tracks. When next we get a view of northern Germany we find it full of Slavs, *e.g.* from Procopius (*B.G.* ii. 15) we know that they held the Mark of Brandenburg by 512; but this settlement was effected without attracting the attention of any contemporary writer. Modern historians seem to adopt their attitude to the process according to their view of the Slavs; German writers, in their contempt for the Slavs, mostly deny the possibility of their having forced German tribes to leave their homes, and assume that the riches of southern Europe attracted the latter so that they willingly gave up their barren northern plains; most Slavonic authors have taken the same view in accordance with the idealistic picture of the peaceful, kindly, democratic Slavs who contrast so favourably with the savage Germans and their war-lords; but of late they have realised that their ancestors were no more peaceful than any one else, and have wished to put down to warlike pressure from the Slavs all the southward movements of the German tribes, to whom no choice was left but to try to break through the Roman defences. A reasonable view is that the expansion of the Eastern Germans in the last centuries B.C. was made at the expense of the Slavs, who, while no more peaceful than the Germans, were less capable than they of combining for successful war, so that Goths and others were dwelling among them and lording it over them; that the mutual competitions of the Germans drove some of these against the Empire, and when this had become weakened, so that it invited attack, some tribes and parts of tribes moved forward without any pressure from behind; this took away the strength of the German element, and the Slavs, not improbably under German organization, regained the upper hand in their own lands and could even spread westwards at the expense of the German remnant.

Almost as uncertain is the exact time when the Southern Slavs began to move towards the Balkans. If already at the time of Trajan's conquests there were Slavs in Dacia, it would account for the story in Ps. Nestor that certain Volchi or Vlachi, *i.e.* Romance speakers, had conquered the Slavs upon the Danube and driven them to the Vistula, for the place that the name of Trajan has in Slavonic tradition, and for the presence of an agricultural population, the Sarmatae Limigantes subject to the nomad Sarmatae (*q.v.*), on the Theiss. In any case, we cannot say that the Slavs occupied any large parts of the Balkan Peninsula before the beginning of the 6th century, when they appear in Byzantine history as a new terror; there seems to have been an invasion in the time of Justin, and another followed in 527 (Procopius, *B.G.* iii. 40 and *Hist. Arc.* 18). At the same time as the Slavs, the Huns, the Bulgars, and after 558 the Avars, were also making invasions from the same direction. The first and last disappeared like all nomads, but the Bulgars, making themselves lords of one section of the Slavs, gave it their own name. By 584 the Slavs had overrun all Greece, and were the worst western neighbours of the Eastern Empire. Hence the directions how to deal with Slavs in the *Strategicum* of the emperor Maurice (*c.* 600) and the *Tactics* of Leo.

By the end of the following century they were permanently settled throughout the whole of the Balkan Peninsula. (For their further history see SERVIA, BULGARIA, BOSNIA, DALMATIA, CROATIA-SLAVONIA.) These Southern Slavs, though divided into nationalities, are closely akin to one another. There is no reason to think the Serbo-Croats an intrusive wedge, although Constantine Porphyrogenitus (*De adm. Imp.* 30-33) speaks of their coming from the north in the time of Heraclius—the middle of the 7th century. Their dialects shade into one another, and there is no trace of any influence of the North-Western group. Constantine was probably led astray by the occurrence of the same tribal names in different parts of the Slavonic world. Meanwhile the Southern Slavs were cut off from the rest of the race by the foundation in the 6th century of the Avar kingdom in Pannonia, and after its destruction in the 7th, by the spread of the Germans south-eastwards, and finally by the incursion of another Asiatic horde, that of the Magyars, who have maintained themselves in the midst of Slavs for a thousand years. Their conquests were made chiefly at the expense of the Slovenes and the Slovaks, and from their languages they have borrowed many words in forms which have now disappeared.

Of the history of the Eastern Slavs, who were to become the Russian people, we know little before the coming of the Swedish Rus, who gave them their name and organization; we have but the mention of Antae acting in concert with the other Slavs and the Avars in attacking the Empire on the lower Danube, and scattered accounts of Mussulman travellers, which show that they had reached the Don and Volga and stretched up northward to Lake Ilmen. The more southerly tribes were tributary to the Khazars. An exact definition of the territory occupied by each Slavonic people, and a sketch of its history from the time that it settled in its permanent abode, will be found either under its own name or under that of its country.

Culture and Religion.—For all the works treating of Slavonic antiquities we cannot draw a portrait of the race and show many distinguishing features. Savage nations as described by the Greeks and Romans are mostly very much alike, and the testimony of language is not very easy to use. The general impression is one of a people which lived in small communistic groups, and was so impatient of authority that they scarcely combined for their own defence, and in spite of individual bravery only became formidable to others when cemented together by some alien element: hence they all at one time or another fell under an alien yoke; the last survivals of Slavonic licence being the veče of Novgorod, and the Polish diet with its unpractical regard for any minority. The Slavs were acquainted with the beginnings of the domestic arts, and were probably more given to agriculture than the early Germans, though they practised it after a fashion which did not long tie them to any particular district—for all writers agree in telling of their errant nature. They were specially given to the production of honey, from which they brewed mead. They also appear to have been notable swimmers and to have been skilled in the navigation of rivers, and even to have indulged in maritime piracy on the Aegean, the Dalmatian coast and most of all the Baltic, where the island of Rügen was a menace to the Scandinavian and German sea-power. The Oriental sources also speak of some aptitude for commerce. Their talent for music and singing was already noticeable. Of their religion it is strangely difficult to gain any real information. The word Bogŭ, "god," is reckoned a loan word from the Iranian Baga. The chief deity was the Thunderer Perún (cf. Lith. Perkúnas), with whom is identified Svarog, the god of heaven; other chief gods were called sons of Svarog, Dažbog the sun, Chors and Veles, the god of cattle. The place of this latter was taken by St Blasius. A hostile deity was Stribog, god of storms. There seem to have been no priests, temples or images among the early Slavs. In Russia Vladimir set up idols and pulled them down upon his conversion to Christianity; only the Polabs had a highly developed cult with a temple and statues and a definite priesthood. But this may have been in imitation of Norse or even Christian institutions. Their chief deity was called Triglav, or the three-headed; he was the same as Svętovit, apparently a sky god in whose name the monks naturally recognized Saint Vitus. The goddesses are colourless personifications, such as Vesna, spring, and Morana, the goddess of death and winter. The Slavs also believed, and many still believe, in Vily and Rusalki, nymphs of streams and woodlands; also in the Bába-Jagá, a kind of man-eating witch, and in Běsy, evil spirits, as well as in vampires and werewolves. They had a full belief in the immortality of the soul, but no very clear ideas as to its fate. It was mostly supposed to go a long journey to a paradise (raj) at the end of the world and had to be equipped for this. Also the soul of the ancestor seems to have developed into the house or hearth god (Domovój, Křet) who guarded the family. The usual survivals of pagan festivals at the solstices and equinoxes have continued under the form of church festivals.

Christianity among the Slavs.—The means by which was effected the conversion to Christianity of the various Slavonic nations has probably had more influence upon their subsequent history than racial distinctions or geographical conditions.

Wherever heathen Slavonic tribes met Christendom missionary effort naturally came into being. This seems first to have been the case along the Dalmatian coast, where the cities retained their Romance population and their Christian faith. From the 7th century the Croats were nominally Christian, and subject to the archbishops of Salona at Spalato and their suffragans. From the beginning of the 9th century Merseburg, Salzburg and Passau were the centres for spreading the Gospel among the Slavonic tribes on the south-eastern marches of the Frankish empire, in Bohemia, Moravia, Pannonia and Carinthia. Though we need not doubt the true zeal of these missionaries, it was still a fact that as Germans they belonged to a nation which was once more encroaching upon the Slavs, and as Latins (though the Great Schism had not yet taken place) they were not favourable to the use of their converts' native language. Still they were probably the first to reduce the Slavonic tongues to writing, naturally using Latin letters and lacking the skill to adapt them satisfactorily. Traces of such attempts are rare; the best are the Freisingen fragments of Old Slovene now at Munich.

In the eastern half of the Balkan Peninsula the Slavs had already begun to turn to Christianity before their conquest by the Bulgars. These latter were hostile until Boris, under the influence of his sister and of one Methodius (certainly not the famous one), adopted the new faith and put to the sword those that resisted conversion (A.D. 865). Though his Christianity came from Byzantium, Boris seems to have feared the influence of the Greek clergy and applied to the Pope for teachers, submitting to him a whole series of questions. The Pope sent clergy, but would not grant the Bulgarians as much independence as they asked, and Boris seems to have repented of his application to him. He raised the question at the Council of Constantinople (A.D. 870), which decided that Bulgaria was subject to the Eastern Church.

Cyril and Methodius.—In the same way Rostislav, prince of Greater Moravia, fearing the influence of Latin missionaries, applied to Byzantium for teachers who should preach in the vulgar tongue (A.D. 861). The emperor chose two brothers, sons of a Thessalonian Greek, Methodius and Constantine (generally known as Cyril by the name he adopted upon becoming a monk). The former was an organizer, the latter a scholar, a philosopher and a linguist. His gifts had been already exercised in a mission to the Crimea; he had brought thence the relics of S. Clement, which he finally laid in their resting-place in Rome. But the main reason for the choice was that the Thessalonians, surrounded as they were by Slavonic tribes, were well known to speak Slavonic perfectly. On their arrival in Moravia the brothers began to teach letters and the Gospel, and also to translate the necessary liturgical books and instruct the young in them. But soon (in 864) Rostislav was attacked by Louis the German and reduced to complete obedience, so that there could be no question of setting up a hierarchy in opposition to the dominant Franks, and the attempts to establish the Slavonic liturgy were strongly opposed. Hearing of the brother's work Pope Nicholas I. sent for them to Rome. On their way they spent some time with Kocel, a Slavonic prince of Pannonia, about Platten See, and he much favoured the Slavonic books. In Venice the brothers had disputes as to the use of Slavonic service-books; perhaps at this time these found their way to Croatia and Dalmatia. On their arrival in Rome Nicholas was dead, but Adrian II. was favourable to them and their translations, and had the pupils they brought with them ordained. In Rome Constantine fell ill, took monastic vows and the name of Cyril, and died on the 14th of February 869. Methodius was consecrated archbishop of Pannonia and Moravia, about 870, but Kocel could not help him much, and the German bishops had him tried and thrown into prison; also in that very year Rostislav was dethroned by Svatopluk, who, though he threw off the Frankish yoke, was not steadfast in supporting the Slavonic liturgy. In 873 Pope John VIII. commanded the liberation of Methodius and allowed Slavonic services, and for the next few years the work of Methodius went well. In 879 he was again called to Rome, and in 880 the Pope distinctly pronounced in his favour and restored him to his archbishopric, but made a German, Wiching, his suffragan. Methodius died in 885, and Wiching, having a new pope, Stephen V. (VI.), on his side, became his successor. So the Slavonic service-books and those that used them were driven out by Svatopluk and took refuge in Bulgaria, where the ground had been made ready for them. Boris, having decided to abide by the Greek Church, welcomed Clement, Gorazd and other disciples of Methodius. Clement, who was the most active in literary work, laboured in Ochrida and others in various parts of the kingdom.

In spite of the triumph of the Latino-German party, the Slavonic liturgy was not quite stamped out in the west; it seems to have survived in out-of-the-way corners of Great Moravia until that principality was destroyed by the Magyars. Also during the life of Methodius it appears to have penetrated into Bohemia, Poland and Croatia, but all these countries finally accepted the Latin Church, and so were permanently cut off from the Orthodox Servians, Bulgarians and Russians.

These details of ecclesiastical history are of great importance for understanding the fate of various Slavonic languages, scripts and even literatures. From what has been said above it appears that Cyril invented a Slavonic alphabet, translated at any rate a Gospel lectionary, perhaps the Psalter and the chief service-books, into a Slavonic dialect, and it seems that Methodius translated the Epistles, some part of the Old Testament, a manual of canon law and further liturgical matter. Clement continued the task and turned many works of the Fathers into Slavonic, and is said to have made clearer the forms of letters. What was the alphabet which Cyril invented, where were the invention and the earliest translations made by him, and who were the speakers of the dialect he used, the language we call Old Church Slavonic (O.S.)? As to the alphabet we have the further testimony of Chrabr, a Bulgarian monk of the next generation, who says that the Slavs at first practised divination by means of marks and cuts upon wood; then after their baptism they were compelled to write the Slavonic tongue with Greek and Latin letters without proper rules; finally, by God's mercy Constantine the Philosopher, called Cyril, made them an alphabet of 38 letters. He gives the date as 855, six or seven years before the request of Rostislav. If we take this to be exact Cyril must have been working at his translations before ever he went to Moravia, and the language was presumably that with which he had been familiar at Thessalonica—that of southern Macedonia, and this is on the whole the most satisfactory view. At any rate the phonetic framework of the language is more near to certain Bulgarian dialects than to any other, but the vocabulary seems to have been modified in Moravia by the inclusion of certain German and Latin words, especially those touching things of the Church. These would appear to have been already familiar to the Moravians through the work of the German missionaries. Some of them were superseded when O.S. became the language of Orthodox Slavs. Kopitar and Miklosich maintained that O.S. was Old Slovene as spoken by the subjects of Kocel, but in their decision much was due to racial patriotism. Something indeed was done to adapt the language of the Translations to the native Moravian; we have the Kiev fragments, prayers after the Roman use in which occur Moravisms, notably *c* and *z* where O.S. has *št* and *zd*, and fragments at Prague with Eastern ritual but Čech peculiarities. Further, the Freisingen fragments, though their language is in the main Old Slovene and their alphabet Latin, have some connexion with the texts of an O.S. Euchologium from Sinai.

O.S, Old Bulgarian.

Alphabets.—Slavonic languages are written in three alphabets according to religious dependence; Latin adapted to express Slavonic sounds either by diacritical marks or else by conventional combinations of letters among those who had Latin services; so-called Cyrillic, which is the Greek Liturgical Uncial of the 9th century enriched with special signs for Slavonic letters—this is used by all Orthodox Slavs; and Glagolitic, in the "spectacled" form of which certain very early O.S. documents were written, and which in another, the "square," form has survived as a liturgical script in Dalmatia, where the Roman Church still allows the Slavonic liturgy in the dioceses of Veglia, Spalato, Zara and Sebenico, and in Montenegro; the Croats now employ Latin letters for civil purposes.

The annexed table gives these alphabets—the Glagolitic in both forms with numerical values (columns 1-3); the Cyrillic in its fullest development (4, 5), with the modern version of it made for Russian (6) by Peter the Great's orders; Bulgarian uses more or less all the Russian letters but the reversed *e* and the last two, while keeping more old Cyrillic letters, but its orthography is in such a confused state that it is difficult to say which letters may be regarded as obsolete; Servian (7) was reformed by Karadžić (Karajich (*q.v.*)) on the model of Russian, with special letters and ligatures added and with unnecessary signs omitted. The old ways of writing Slavonic with Latin letters were so confused and variable that none of them are given. The Čechs first attained to a satisfactory system, using diacritical marks invented by Hus; their alphabet has served more or less as a model for all the other Slavonic languages which use Latin letters, and for that used in scientific grammars, not only of Slavonic but of Oriental languages. Column 8 gives the system as applied to Croat, and corresponding exactly to Karadžić's reformed Cyrillic. Column 9 gives the Čech alphabet with the exception of the long vowels, which are marked by an accent; in brackets are added further signs used in other Slavonic languages, *e.g.* Slovene and Sorb, or in strict transliterations of Cyrillic. Polish (10) still offers a compromise between the old arbitrary combinations of letters and the Čech principle of diacritical marks. The last column shows a convenient system of transliterating Cyrillic into Latin letters for the use of English readers without the use of diacritical marks; it is used in most of the non-linguistic articles in the *Encyclopaedia Britannica* which deal with Slavs. With regard to Glagolitic (derived from *Glagol*, a word) and Cyrillic, it is clear that they are closely connected. The language of the earliest Glagolitic MSS. is earlier than that of the Cyrillic, though the earliest dated Slavonic writing surviving is a Cyrillic inscription of Tsar Samuel of Bulgaria (A.D. 993). On the whole Glagolitic is likely to be the earlier, if only that no one would have made it who knew the simpler Cyrillic. It certainly bears the impress of a definite mind, which thought out very exactly the phonetics of the dialect it was to express, but made its letters too uniformly complicated by a love for little circles. A sufficiently large number of the letters can be traced back to Greek minuscules to make it probable that all of them derive thence, though agreement has not yet been reached as to the particular combinations which were modified to make each letter. Of course the modern Greek phonetic values alone form the basis. The numerical values were set out according to the order of the letters. Some subsequent improvement, especially in the pre-iotized vowels, can be traced in later documents. The presumption is that this is the alphabet invented by Cyril for the Slavs who formerly used Greek and Latin letters without system.

When brought or brought back to Bulgaria by Clement and the other pupils of Methodius, Glagolitic took root in the west, but in the east some one, probably at the court of Simeon, where everything Greek was in favour, had the idea of taking the arrangement of the Glagolitic alphabet, but making the signs like those of the Uncial Greek then in use for liturgical books, using actual Greek letters as far as they would serve, and for specifically Slavonic sounds the Glagolitic signs simplified and made to match the rest. Where this was impossible in the case of the complicated signs for the vowels, he seems to have made variations on the letters A and B. With the uncials he took the Greek numerical values, though his alphabet kept the Glagolitic order. Probably the Glagolitic letters for *š* and *št* have exchanged places, and the value 800 belonged to *š*, as the order in Cyrillic is Ⱋ, Ⱌ, Ⱎ, Ⱋ. Who invented Cyrillic we know not; Clement has been said to have made letters clearer, but only in a secondary source and he seems to have been particularly devoted to the tradition of Methodius, and he was bishop of Ochrida, just where Glagolitic survived longest.

Mention must be made of Brückner's theory that Cyril invented Cyrillic first, but degraded it into Glagolitic to hide its Greek origin from the Latin clergy, the whole object of his mission being hostility to Rome, whereas in Orthodox countries this caution was soon seen to be unnecessary. The Glagolitic alphabets in the table are copied from Codex Marianus (11th century) and the Reims gospel, an O.S. MS. of the 14th century, on which the kings of France took their coronation oath.

As to the special sounds which these various scripts expressed, we may notice in the vocalism a tendency to broaden the short vowels and to narrow the long ones, a process which has left results even where distinctions of quantity no longer exist; further, the many changes which can be followed in historic time and are due to the destruction of the old rule of open syllables by the disappearance of the half vowels *ĭ* and *ŭ*, or to their developing into full vowels where indispensable for pronunciation (No. I. *inf.*). But the ruling principle which has determined the physiognomy of Slavonic speech is the degree in which consonants have been affected by the following vowel. Where this has been broad *a, o, u, y, ą, ŭ*, this has resulted only in an occasional labialization most noticeable in the case of *l*; where it has been narrow, *i, e, ě*, (once *ea* or *ē*), *ę, ĭ*, and *į*, the result has been palatalization or "softening" in various degrees, ranging from a slight change in the position of the tongue producing a faint *j* sound in or just after the consonant—expressed in column 9 by the sign ′, and in Cyrillic by the pre-iotizing of the following vowel—to the development out of straightforward mutes and sibilants of the sibilants, palato-sibilants and affricates *z, s, ž, š, ř, dz, c, dž, č, šč*, &c. (see No. 9 and V. *inf.*).

Slavonic Languages.—The Slavonic languages belong to the Indo-European (I.E.) family. Within that family they are very closely connected with the Baltic group, Old Prussian, Lithuanian (Lithu.) and Lettish, and we must regard the linguistic ancestors of both groups as having formed one for some time after they had become separated from their neighbours. If the original home of the I.E. family is to be set in Europe, we may take the Balto-Slavs to have represented the north-eastern extension of it. The Balto-Slavs have much in common with the northerly or German group, and with the easterly or Aryan group, their next neighbours on each side. The Aryans likewise split into two divisions, Iranian and Indian, whereof the former, in the Sarmatians, remained in contact with the Slavs until after the Christian era, and gave them some loan words, *e.g.* *Bogŭ*—Pers. *Baga* (god); Russian, *Sobaka;* Median, *Çpaka* (dog). The south-eastern or Thracian group (Armenian) and beyond it the Illyrian (Albanian) made up the four groups which have sibilants for I.E. non-velar gutturals (see *inf.* No. 9), and in this stand apart from most European groups, but in other respects the Balto-Slavs were quite European.

The Baltic group and the Slavs were separated by the marshes of White Rŭssia, and after their early oneness did not have much communication until the Slavs began to spread. Since then the Baltic languages have borrowed many Slavonic words. After the Aryans had moved eastwards Slavonic was left in contact with Thracian, but we know so little about it that we cannot measure their mutual influence. On the other side the Germans, beginning as the next group to the Balto-Slavs, and having thereby much in common with them (so much so that Schleicher wanted to make a Germano-Slavo-Baltic group), have never ceased to influence them, have given them loan words at every stage and have received a few in return.

After the Baltic group had separated from the Slavonic, we must imagine a long period when Slavonic (Sl.) was a bundle of dialects, showing some of the peculiarities of the future languages, but on the whole so much alike that we may say that such and such forms were common to them all. This stage may be called Proto-Slavonic. Except for the few cases where Old Church Slavonic (O.S.) has either definitely South Slavonic characteristics or peculiar characteristics of its own, as written down by Cyril it represents with wonderful completeness Proto-Slavonic at the moment of its falling apart, and words cited below may be taken to be O.S. unless otherwise designated. Some of the main characteristics of the Slavonic languages as a whole in relation to I.E. are indicated below; restrictions and secondary factors are necessarily omitted. As a rule O.S. represents the Slavonic languages fairly well, while Latin or Greek equivalents are given as the most familiar examples of I.E. Hypothetical forms are starred.

1. I.E. *ī* becomes (>) *i*, *gosti*: *hostīs* (acc. pl.); I.E. *ĭ* > *ĭ*, *vĭdova*: *vidua*; I.E. *j*>*j*, *jucha* : *jus* (broth).

2. I.E. *ē* becomes *ě*, *sěmę*: *sēmen*; I.E. *ĕ* > *ě*. *berą*: *fero.*

3. I.E. *ă* and *ŭ* are alike *o* in Sl., *orati*: *arare*; *osmĭ*: *octo*; I.E. *ŏ* in end syllables, >*ŭ*; *vozŭ*: ὄχος; I.E. *ā* and *ō* are alike *a*, *bratrŭ*: *frater*; *dŭva*: *duo.*

4. I.E. *ū* becomes *y*, *ty*: *tu*; I.E. *ŭ*>*ŭ*, *snŭcha*: *nurus*, Sanskr. *snušā* : I.E. *u̯*>*v*, *vezą*: *veho.*

5. I.E. *r̥* and *l̥* both long and short survived as vowels, **vl̥kŭ* written *vlĭkŭ*, Sanskr. *vr̥kas*, "wolf"; consonantal *r* and *l* survived unchanged.

6. I.E. *m̥* and *n̥* both long and short: the former gave *ĭ* or *ŭ*; *sŭto*: *centum*; the latter *ę* or *ą*, *desętĭ*: *decem*. Consonantal *m* and *n* mostly survived before a vowel, after it they coalesced with it to make the nasal vowels *ą* and *ę*; *pąti*: *pontis*; *pętŭ*: πέμπτος.

7. I.E. Aspirates are represented by corresponding sonants, *berą*: *fero*; *medŭ* ("honey," "mead"): μέθυ; *mĭgla*: ὀμίχλη.

8. I.E. *s* often becomes *ch*; *vetŭchŭ*: *vetus*; not always, *synŭ*: Lithu. *sūnùs*, "son"; otherwise *ch* generally renders Gothic *h* in loan words; *chlěbŭ*: *hlaibs*, "loaf"; *chyzŭ*: *hus*, "house."

9. I.E. velar gutturals *k, g, gh* and labio-velars, *q, g, gh* become in Sl. *k, g, g*, *ključĭ*: *clavis*; *ąglŭ*: *angulus*; *mĭgla*: ὀμίχλη; *kŭto*: *quis*, *govedo*: βοῦς, Sanskr. *gāúš*; *sněgŭ*: *nix, nivem*, but the Palato-gutturals *k̂, ĝ, ĝh* become Sl. *s, z, z*; *desętĭ*: *decem*; *zrĭno*: *granum*; *zima*: *hiems*; Lithu. *š, ž, ž; deszimtis, žïrnis, žëma.*

10. (*a*) Gutturals *k, g, ch* (for *s*) before *e, ě* (for *ē*), *i, ĭ, ę* and *j* early in the Proto-Sl. period became *č, ž, š*, *vlĭče*, voc. of *vlĭkŭ*: λύκε; *želądi*: *glandis*; *plušę*, 3rd pl. fr. *pluchŭ*: ἔπλευσαν.

(*b*) Later *k, g, ch* before *ě, i* (for *oi* or *ai*), and sometimes after *ĭ, i, ę*, > *c, dz* (*z*), *s*. *Vlĭcě* loc. cf. οἴκοι; *lęzi*, imperat. of *lęgą*, "lie": λέγοις; *dusi*, *dusěchŭ*, nom. loc. pl. of *duchŭ*, "spirit"; *kŭnęzĭ*: Ger. *kuning*: "king."

(*c*) I.E. or Proto-Sl. *sj, zj* became *š, ž*, *šiti*, Lithu. *siuti*, Lat. *suo*, "sew"; *nožĭ* for **nozjo*, "knife."

(*d*) Non-guttural consonants followed by *j* (*tj, dj, nj*; *pj, bj, vj, mj*) gave different results (except *nj*) in different languages (see below No. V.), but in Proto-Sl. there was already a tendency for the *j* to melt into and so change the consonant.

11. Proto-Sl. gradually got rid of all its closed syllables, hence—

(*a*) Final consonants were dropped. *Domŭ*: *domus.*

(*b*) Diphthongs became simple vowels *ai, oi* > *ě*; *lěvŭ*: *laevus*; *vědě*: οἶδα; *ei* > *i*; *vidŭ*: εἶδος; *au, eu, ou* > *u*; *ucho*: *auris.*

12. Proto-Slavonic had long, short and very short or half vowels (those expressed above by *ĭ* and *ŭ*). It had a musical accent, free in its position with different intonations when it fell upon long syllables. (For the fate of these in different modern languages see below, No. VIII.)

13. The phenomena of vowel gradation (*Ablaut*) as presented by Slavonic are too complicated to be put shortly. In the main they answer to the I.E., *e.g.* O.S. *bĭrati*, *berą*, *sŭ-borŭ*: δί-φρος, φέρω, φόρος.

In their morphology the Sl. languages have preserved or developed many interesting forms. Nouns have three genders, three numbers in O.S., Slovene, Serbo-Croat and Sorb (other tongues have more or less numerous traces of the Dual), and, except Bulgarian, seven cases—Nom., Voc. (not in Gt. Russian or Slovene), Acc., Gen., Dat., Instrumental and Locative. The Abl. has coincided with the Genitive.

The *-o*, *-a* and *-i* declensions have gained at the expense of the consonantal stems, and phonetic change has caused many cases to coincide especially in the *-i* decl. The comparative of the Adj. is formed on I.E. models with *š* < *sj* corresponding to Latin *r* < *s*, *mĭnĭi*, gen. *mĭnĭša*, cf. *minus, minoris*. The pronominal declension is less well preserved. There is no article, but *i* (ὅς) has been added to the adj. to make it definite; also in Bulgarian and in some dialects of Russian *tŭ* is postfixed as a real article.

The Sl. verb has lost most of the I.E. voices, moods and tenses.

The passive only survives in the pres. and past participles; of the finite moods there are but the ind. and opt. (almost always used as an imperat.) left; its only old tenses are the pres. and the aor., to which it has added an impf. of its own. There is an inf. (in *-ti*, being an old dat.) and a supine in *-tŭ*, an accusative. Of active participles there are a pres. and a past and a second past part. used in making compound tenses. There are a solitary perfect form, *vědě*: οἶδα, and a solitary fut. part. *byšę*, gen. *byšęšta*: φύσων, φύσοντος. The verb has two stems; from the pres. stem is formed the ind. pres. and impf., the imperat. and the act. and pass. pres. participles. All other forms are based upon the infinitive stem.

Personal Endings:—

	PRIMARY.						SECONDARY.		
	Non-Thematic.			Thematic.					
	Sing.	Du.	Plur.	Sing.	Du.	Plur.	Sing.	Du.	Plur.
1.	*-mĭ*	*-vě*	*-mŭ*	-(*m*)	*-vě*	*-mŭ*	-(*m*)	*-vě*	*-mŭ*
2.	*-si*	*-ta*	*-te*	*-ši*	*-ta*	*-te*	-(*s*)	*-ta*	*-te*
3.	*-tĭ*	*-te*	*-ętĭ*	*-tĭ*	*-te*	-(*n*)*tĭ*	-(*t*)	*-te*	-(*nt*)

1st Sing. In thematic verbs the vowel + *m* has given *ą*, but there has been a tendency to replace it according to the non-thematic analogy, which has necessitated changes in 1st plur.

2nd Sing. *-ši* has given *-šĭ* everywhere but in O.S.

3rd Sing. *-tĭ* has been dropped everywhere but in Russian, where the literary language has *tŭ*. The Dual only survives in Serb, Sorb, Slovene and O.S., and in these the forms are confused.

1st plur. *-mŭ* has developed a full vowel where the 1st sing. has replaced the *-m*.

The secondary endings have lost their *-m*, *-s*, *-t* and *-nt* by phonetic change.

Non-thematic presents are, *jesmĭ*, εἰμί, *sum*; *damĭ* (redupl. for **dadmĭ*), δίδωμι; *jamĭ*, *edo*; *věmĭ*, Sanskr. *vedmi*, "I wit"; *imamĭ* (new form of *emo*), "I have."

The aorist has no augment; it is sigmatic and non-sigmatic. The latter or 2nd aor. (cf. Hom. impf. φέρον, φέρε) survived only in consonant stems and that in O.S. and Old Čech, *pekŭ* = ἔπεσσον. It was common in the 2nd and 3rd sing. (where the -s- forms would not be clear) *peče* < **peke-s*, **peke-t* = ἔπεσσες, ἔπεσσε. The sigmatic aorist very rarely and only in consonant stems in O.S. keeps its -s-, *věsŭ* < **vedsŭ*. In stems ending in *k*, *r* or a vowel, *s* > *ch*; *bychŭ* = ἔφῦσα and this *ch* > *š* before *ę*. The ordinary later form for consonant stems inserts a vowel, *vedochŭ*. The aorist has survived in S. Slavonic and in Sorb, and is found in the older stages of the other tongues. The same languages (except Slovene) have kept the impf. which was present in Proto-Sl. but does not go back to I.E., being formed on the analogy of the aor. With the aor. has coalesced the opt. *bimĭ*, "be," used with the 2nd past part. to make a conditional. Stem of pres. part. act. ends in *-nt-* but the consonant decl. has become an *-i̯o-* decl., so we have *vezy* < I.E. **u̯eĝhonts* = ἔχων, gen. *vezą̌šta* < **vezontja* as against ἔχοντος. Pres. part. pass. ends in *-mŭ*; it has survived more or less in Russian, elsewhere is obsolescent. Past part. act. I. is formed with I.E. *-u̯es-*; nom. sing. masc. *-u̯ōs* (εἰδώς) gave *ŭ*, *vedŭ*, having led, *byvŭ*, having been; but in fem. and oblique cases formed as from *-i̯o-* stem *s* remained, hence Russian *vedšij*, *byvšij*. Past part. act. II. in *-l-* cf. Lat. *bibulus* from *bibo*, used with an auxiliary to form past and conditional. Past part. pass. in *-t-* or *-n-*; *tertŭ* = *tritus*. *Znanŭ* = *known*. I.E. future having been lost, futurity is expressed by an auxiliary *bądą* (*ero*) *choštą* (will), &c. with the inf. or by the pres. form of the perfective verb. The passive is expressed either by the use of the passive participles or by the reflexive *sę*, which can refer to the 1st and 2nd persons as well as to the 3rd.

Syntactical peculiarities of the Slavonic languages that may be noted are a tendency to use the genitive instead of the accusative (which has often coincided in form with the nominative) in the case of living beings, masculine *-o-* stems, and in the plur.; the use of the genitive for the accusative or even nominative in negative clauses; the dative absolute and the dative as subject to an infinitive; the instrumental instead of the nominative as a predicate, and in *oratio obliqua* the preservation of the tense of the original statement instead of our way of throwing it into the past.

In the use of the verbs the development of "aspects" makes up for the few tenses. Actions (or states) expressed by a verbal form have a beginning, a continuance and an end. There are, however, some (momentaneous) actions whose beginning and end come together and allow no continuance. All verbs fall into two great divisions, *imperfective*, which express the continuance of an action, without regard to its beginning or end, and *perfective*, which express the points of beginning or ending. The continuance of an action may be unbroken or may consist of like acts which are repeated. So imperfective verbs are divided into *durative*, as *nesti*, "to be carrying," and *iterative*, as *nositi*, "to be wont to carry"; the repeated acts of the iterative can either be each of them momentaneous, *e.g.* Čech, *střileti*, "to shoot," *i.e.* "be firing single shots," or each have some continuance, *e.g. nositi* above, or we can even express the occasional repetition of groups of momentaneous actions, *e.g.* Čech. *střílivati*, "to have the habit of going out shooting."

Among perfective verbs we have (1) *momentaneous*, expressing action which has no continuance, *kriknąti*, "to give a cry," *sěsti*, "to take a seat"; (2) *finitive*, expressing not the continuance of the action, though that there has been, but its end or completion, *naplŭniti*, "to fill to the brim"; (3) *ingressive*, expressing the moment of beginning an action, *vŭzl' ubiti*, "to fall in love with."

As perfective verbs do not express continuance, an idea implied in the present, they cannot require a present form, so this is used for perfective futures; *e.g. sędą* (pres. form from perfective *sěsti*) = "I shall take a seat," as opposed to imperfective *bądą siděti*, "I shall be sitting." If a preposition is compounded with a durative verb as *nesti*, "to carry" (in general), "to be carrying," it makes it perfective, as *iznesti*, "to carry out" (one single action brought to a conclusion), so Eng. "sit" is usually imperfective, "sit down" perfective. If an iterative has a preposition it is mostly used as a durative; *iznositi* can mean "habitually to carry out" but more often = "to be carrying out," that is, it supplies the imperfective form to *iznesti*. The development of this system has enabled some Slavonic languages, *e.g.* Russian, to do with only two tenses, pres. and past, to each verb morphologically considered, perfective and imperfective verbs supplementing each other; *e.g.* if we take a Greek verb, the pres. (ind. and infin.) and imperf. correspond to the present, inf. and past of a Russian imperfective verb; the aor. indic. and inf. are represented by the perfective past and infin., which has also to do duty for the Greek perfect and plup.; the future and the future perfect in Greek do not express the same distinctions as the imperfective future and perfective future (in form a present) in Sl., the Greek giving chronological order of action, but not giving the distinction of aspect, though the future perfect is naturally perfective.

The prepositions are very much like those in other I.E. languages both in actual forms and in use.

The formation of the sentence is not naturally complicated; but Sl. has in times past been largely influenced by Greek, Latin and German with their involved periods; latterly there has been a tendency to follow the simpler models of French and English.

Such being the Slavonic languages as a whole and regarded in their relationship to I.E., they may now be considered in their relationship to each other, and some of the principal characteristics enumerated upon which their internal classification has been founded. More or less complete accounts of each language will be found under its name.

Distinctive Points of Different Sl. Languages.[1]—I. (*ŭ*, *ĭ*). The fate of the Proto-Sl. half vowels *ŭ*, *ĭ*, still preserved in O.S., *e.g. sŭnŭ*, "sleep," *dĭnĭ*, "day," is various; as a rule they disappear, *ŭ* entirely (though when final still written in R.), *ĭ* leaves a trace by softening the preceding consonant. But if needed to eke out

[1] Bulg. = Bulgarian; Č. = Čech; Kaš. = Kašube; Lit. R. = Little Russian; P. = Polish; R. = Russian, *i.e.* Great Russian; Ser. = Servian; Wh. R. = White Russian.

consonants, in Sorb, Slovak, Lit. R. and mostly in Gt. R., *ŭ*, *ĭ* develop into full vowels *o*, *e*—R. *sonŭ*, gen. *sna*; *d'enĭ*, gen. *dn'a*. In Polish and Čech both > *e*, but in P. *ĭ* softens the preceding cons., in Č. it usually does not—P. *sen*, *dzień*; Č. *sen*, *den*; in Slovene and Ser. they are not distinguished, Slovene *ŭ*, *a* or *e*, *san*, *dan* or *den* = Ser. *a*, *san*, *dan*, gen. *dana*, Ser. keeping the middle vowel which is elsewhere dropped. Bulgarian varies dialectically.

II. (*y*.) *y* only remains in Gt. Russian, Polish and Sorb though still written in Čech; it has elsewhere become *i*, but in Polish it becomes *i* after *k* and *g*, in Sorb and R. after *k*, *g*, *ch*—O.S. *kysnąti*, “ go sour,” *gybnąti*, “ perish,” *chytrŭ*, “ cunning ”; P. *kisnąć*, *ginąć*, *chyter*; R. *kisnutĭ*, *gibnutĭ*, *chit'erŭ*.

III. (*r*, *l*.) The treatment of the liquids varies greatly.

(*a*) *r* is always a lingual trill, never alveolar. In S. Slav. it is only softened before *j* and *r̥*—O.S. *zorja*, “ dawn.” In N.W. and E. Slav. *r* became *r'* before *ĭ*, *i*, *e*, *ę*, *ě* and *j*. Russian and Slovak have remained at this stage, Č., Polish, Kaš. have made *ŕ* into *ř* (*rz*) in which *r* and *ž* are run into one. (See Table I.) But

Table I.

	ĭ	*i*	*e*	*ę*	*ě*	*j*
O.S. . . .	*zvěrĭ*, “ beast ”	*věriti*, “ believe ”	*remenĭ*, “ strap ”	*tręsą tręseši*, “ *tremo* ”	*rěka*, “ river ”	*zorja*, “ dawn ”
Russian . .	*zvěrĭ*	*věr'itĭ*	*r'em'enĭ*	*tr'asu tr'as'ošĭ*	*r'ěka*	*zor'a*
Polish . . .	*zwierz*	*wierzyć*	*rzemień*	*trząsę trzęsiesz*	*rzeka*	*zorza*

P. *ę* for orig. *ą* does not soften—P. *ręka*: O.S. *rąka*, “ hand.”

In Sorb such a change only happened after *k*, *p*, *t*, in which case High S. has *ś* (written *ř*), Low S. *ś*, but in Low S., *r* after *k*, *p*, *t* becomes *š* even before hard vowels: Proto-Sl. *tri*, “three,” High S. *tši*, Low S. *tśi*; Proto-Sl. *kraj*, “edge,” High S. *kraj*, Low S. *kšaj*.

(*b*) *l* occurs in three varieties, *ł*, *l*, *l'*, but each language has generally either middle *l* alone or else *ł* and *l'*. Lit. R. and Bulg. have all three. *l* has been arrived at in Č. and Slovene by the loss of the distinctions, perhaps under German influence; Ser. has *l* and *l'*, final *ł*>*o*; but *ł* occurs in dialects of all languages and was no doubt in O.S., Proto-Sl. and even Balto-Slav. It has a velar and a labial element and in most languages tends to appear as *o*, *u*, *v* or *w*, though this is only written in Ser. and Lit. R. O.S. *dalŭ*, “ gave,” R. *dalŭ*, Lit. R. *dav*, Wh. R. *dav*, *daw*, P. *dał* (dialect *daų*), Č. *dal*, Ser. *dao*. *l'* is very soft, like Fr. *ville*.

(*c*) N.W. Slav. keeps *-tl-* *-dl-* whereas S. Slav. (except some cases of Slovene *padl*, *pletla*, &c.) and R. drop the *t* and *d*—Č. *padl*, “ fell,” *radlo*, “ *aratrum*,” *pletl*, “ plaited ”; O.S. and R. *palŭ*, *ralo*, *plelŭ*, but R. drops *l* of masc. sing. past part. II. after other consonants. O.S. *neslŭ*, Č. *nesl*, R. *n'esŭ*, “ carried.”

(*d*) Proto-Sl. *r̥*, *l̥* or perhaps *ŭr*, *ĭr*, *ŭl*, *ĭl* gave S. Slav., Č. and Slovak *r̥*, *l̥* written in O.S. *rŭ*, *rĭ*, *lŭ*, *lĭ* indifferently, though soft and hard may once have been distinguished. Of this group Slovene and Ser. later allowed the *l̥* to become *ol*, *ou* or *u*. Sorb, Polish and R. developed various vowels, partly according to the original quality, partly according to other influences, *e.g.* O.S. *srĭdĭce*, “ heart,” *trŭgŭ*, “ market,” *vlĭkŭ*, “ wolf,” *slŭnĭce*, “ *sol* ”; Ser. *srdce*, *trg*, *vuk*, *sunce*; Slovene *srdce*, *trg*, *volk*, *sǫlnce*; Č. *srdce*, *trh*, *vlk*, *slnce*; P. *serce*, *targ*, *wilk*, *słońce*; R. *s'erdce*, *torgŭ*, *volkŭ*, *solnce*.

(*e*) Proto-Sl. *rŭ*, *rĭ*, *lŭ*, *lĭ* had in S. Slav. and partly in Č. the same fate as *r̥*, *l̥*; in Polish and R. the vowel comes after the liquid. O.S. *brŭvĭ*, “brow,” *krĭstŭ*, “cross,” *plŭtĭ*, “ flesh,” *slĭza*, “ tear ”; Ser. *brv*, *krst*, *put*, *suza*; Slovene, *brv*, *krst*, *polt*, *solza*; Č. *brv*, but *plet'*; P. *brew*, *krzest*, *pleć*, (*s*)*łza*; R. *brovĭ*, *kr'estŭ*, *plotĭ*, *sl'eza*.

(*f*) Proto-Sl. *-or-*, *-ol-*, *-er-*, *-el-* before a consonant.

(i.) Type *ort*, *olt* (*ert*, *elt* are not certain) beginning a word.—The liquid mostly comes first, sometimes the same vowel persists in all languages, *e.g.* Proto-Sl. **ordlo* (Lithu. *árklas*, *aratrum*), O.S., Bulg., Ser., Slovene, R. *ralo*, Č. Polab. P., *radlo*. But Proto-Sl. **eldii* (Lithu. *eldija*), O.S. *alŭdiji*, *ladiji*, “boat,” Ser., Slovene, *ladja*, R. *lodĭja*, Č. *lodĭ*, Polab, *lüd'a* and **orvn* (Pruss. *arwis*), O.S. *ravĭnŭ*, “ even,” Ser. *rávan*, Bulg. Slovene, *râven*, R. *rov'enŭ*, Č. *rovný*, P. *równy* show Russian agreeing with N.W. Slav against S. Slav. The difference probably depends on intonation.

(ii.) Type *tort*, *tolt*, *tert*, *telt* with a consonant before as well: the various treatments of this combination are among the chief criteria for classification, esp. the Russian speciality called full vocalism (*polnoglasie*) *torot*, *tolot*, *teret*, *telet* (or *tolot*, *telot*) which is probably archaic, is one of the chief reasons for putting Russian in a separate division; Polish and Sorb come nearest to it, with *trot*, *tlot*, *tret*, *tlet*, but the N.W. division is not uniform as Kašube and the extinct Polab have the interesting forms *tort*, *tlåt*, *trit*, *tlat*, which are partly archaic, partly a transition to the most novel forms of the southern group to which Čech and Slovak in this particular accede, *trat*, *tlat*, *trět*, *tlět*, but after *č* and *ž* Čech has *tlat* for *tlět*. Deviations due to intonation have not been set forth. (See Table II.)

Table II.

Proto-Sl. Stem.	R.	P.	Polab, Kaš.	Č.	S. Sl. *e.g.* O.S.
**gord-* “ *hortus*,” “ town ”	*gorodŭ*	*gród*	*gord*	*hrad*	*gradŭ*
**molt-* “ hammer ” . .	*molotŭ*	*młot*	*mlat*	*mlat*	*mlatŭ*
**berg-* Ger. “ *berg*,” “ shore ”	*b'er'egŭ*	*brzeg*	*brig*	*břeh*	*brěgŭ*
**melk-* “ milk ” . . .	*moloko*	*mleko*	*mlak*—	*mlěko*	*mlěko*
**helm-* “ helm ” . . .	*šel'emŭ* or *šelomŭ*				*šlěmŭ*
**gelb-* “ groove ” . . .	*želobŭ*	*žłób*	(Kaš.) *žłob*	*žlab*	*žlěbŭ*

IV. The Proto-Slavonic nasals *ą* and *ę* could be either long or short. This distribution is fairly kept in languages which have quantity and governs the results in Polish in which the nasal sound is preserved. The examples below show the main representatives. Traces of nasal pronunciation survive in Bulgarian, Slovene and Kašube. (See Table III.)

Table III.

Proto-Sl. *ŏn*, *ōn*; *ĕn*, *ēn*.	O.S. *ą*; *ę*.	Bulg. usu. *ŭ*, or *ǎ*; *e*.	Ser. *u*; *e*.	Slovene. *ŏ*, *ō*; *e*, *ê*.	Č. *u*, *ou*; *e*, *ě*.	Sorb, High, Low. *u*; *a*, *je*; *e*, *ě*.	R. *u*; *ja*.	P. *e*, *a*; *ję*, *ją*.	Kašube. *ą*; *i*, *ī*.
**mŏnka*, “ pain ”	*mąka*	*mŭka*	*mŭka*	*mŏka*, *monka*,	*muka*	*muka*	*múka*	*męka*	*mąka*
**mōnká*, “ flour ”	*mąka*	*mŭnka*	*múka*	*mōka*, *mūka*	*mouka*	*muka*	*muká*	*mąka*	*mąka*
**desĕmtĭ*, “ ten ”	*desętĭ*	*desetĭ*	*deset*	*desêt*	*deset*	*dźesać*, *žaseś*	*d'eś'atĭ*	*dziesięć*	*dźesic*
**pēntĭ*, “ five ”	*pętĭ*	*petĭ*	*pet*	*pêt*	*pět*	*pjeć*, *pěś*	*p'atĭ*	*piać* > *pięć*	*pīc* or *pšinc*

In Kašube *ą* remains; *ę* becomes nasalized *i* or *ī* and this may lose the nasal or restore it as a full *n* or *m*; it has also nasalized all the other vowels and has the power of using nasals in loan-words, *e.g.* *testamąt*, as did O.S. *e.g.* *kolęda*, *kalendae*, *sądŭ* = *sund*. Polab has *ą* and *ę*—*ronka*, O.S. *rąka*, “ hand,” *mengsie* = *męsa*, “ *carnis*,” but *swante* = *svętŭ*, “ holy.”

V. Softening (Palatalization, &c.).—Nothing has so much affected Slavonic speech as the effect of *ĭ*, *i*, *e*, *ě*, *ę* and *j* on preceding consonants, and the variations produced are among the chief points of difference between the languages.

(*a*) The gutturals felt this first of all, *k*, *g*, *ch*, become (I.) *č*, *ž*, *š* and (II.) *c*, *dz*(*z*), *s*, and these changes are universal (see 10, *a*, *b* above) except that after the separation of the Slavs the same process was continued in the S. and E. branches even when a *v* intervened, whereas the N.W. branch remained untouched. Proto-Sl. **květŭ*, "flower," **gvězda*, "star" (*vŭlchvi*), *magi*; O.S. *cvětŭ*, *dzvěsda*, (*vlŭsvi*); R. *cvětŭ*, *zvězda*; but Čech *květ*, *hvězda*; P. *kwiat*, *gwiazda*.

kv. gv.

(*b*) The action of *j* was the most general, influencing the dentals in all languages and in some the labials as well, whereas the narrow vowels act on the dentals only and that not in all languages. The results of Proto-Sl. *tj*, *dj* in O.S. and Bulg. are the most surprising, giving *št'*, *žd'*, by way of *šč* and *ždž* (as is shown by their agreeing with the results of Proto-Sl. *stj*, *skj*, *e.g.* *prělĭšt'enŭ*, "deceived," *išt'ą*, "I seek," cf. R. *lĭščenŭ*, *išču*). Some Macedonians have the strange result *k'* and *g'*. Among the Serbo-Croats we find every grade between *t'*, *d'*, and *ć*, *dź*, or *č*, *dž*, the Slovenes having *ć*, *j* (our *y*), the Čechs and Sorbs *c*, *z*, the Poles and Polabs *c*, *dz*, and the Russians *č* and *ž*; the fate of *ktj* and *gtj* has been the same as that of *tj* throughout.

tj. dj.

Proto-Slav.	O.S.	Bulg.	Mac.	Serbo-Croat and Slovene.	Č.	P.	R.
**světja*, "candle" . .	*svěšt'a*	*svěšta*	*svek'a*	*svijet'a svjeća svêča*	*svíce*	*świeca*	*svěča*
**medja*, "boundary" .	*mežd'a*	*mežda*	*meg'a*	*med'a medža meja*	*meze*	*miedza*	*m'eža*
**pektj*, "stove" . .	*peštĭ*	*peštĭ*		*peć peč*	*pec*	*piec*	*p'ečĭ*
**mogtj*, "power" . .	*moštĭ*	*moštĭ*		*moć moč*	*moc*	*moc*	*močĭ*

(*c*) Before the narrow sounds *ĭ*, *i*, *e*, *ě* and the descendants of *ę* there has resulted a later softening which has gone farthest in Low Sorb, producing *ś* and *ź*, and in High Sorb and Polish, *ć* and *dź*, not so far in Gt. R. where *t' d'* remain, Wh. R. is intermediate with now *ć*, *dź*, now *t'*, *d'*; in Č. even *t' d'* only come before *ĭ*, *i* and *ě*. In S. Slavonic this effect is dialectical. Č. *tělo*, "body," *dělati*, "make," *deset*, "ten"; P. *ciało*, *dzieło*, *dziesięć*; High Sorb, *dźesać*; Low Sorb, *źaseś*; Wh. R. *ćelo*, *dźelo*, *dźesać*; Gt. R. *t'ělo*, *d'ělo*, *d'es'atĭ*.

t'. d'.

(*d*) *S*, *z*, *n*, before *j* gave *š*, *ž*, *n'* throughout (No. 10, *c*, *d*, above). Before the narrow vowels they give *ś*, *ź*, *ń* in Sorb, Polish, Slovak and Russian, but Čech has no *ś* or *ź* or *ń* before *e* nor always before *ĭ*; S. Slavonic has *n'* before *j*. Otherwise in it such softening is only dialectical, but Bulgarian forms a transition to Russian.

s. z. n.

(*e*) In Polish and Sorb we have the labials *p'*, *b'* (*f'*), *v'*, *m'* softening before *j* and the narrow vowels, in Čech only before *ě*, in Slovak nowhere. In S. Slavonic they only soften before *j* and then the *j* appears as *l'* (*pl'*, *bl'*, *vl'*, *ml'*), invariably in Serb, generally in Slovene, generally too in Russian, but there before the narrow sounds of newer formation they can all be softened in the ordinary way (*p'*, *b'*, *f'*, *v'*, *m'*), in Bulgarian this *l* has disappeared and we have *p'*, *b'*, *v'*, *m'*. But O.S. followed the S. Slav. rule; and the *l* was probably once present in N.W. Slav. It remains everywhere in one or two roots—O.S. *pl'ują* (πτύω for *spjują*), R. *pl'uju*, P. *pluję*, otherwise O.S. *zeml'a*, R. *z'eml'a*, P. *ziemia*, "*humus*."

p. b. f. v. m.

On the whole the various languages do not differ much in principle in the treatment of *j*, but softening before *ĭ*, *i*, *e*, *ě*, *ę*, seems to have its extreme point in P., Kaš. and Polab, spreading from them to Sorb, White Russian and Gt. Russian; Čech, Slovak and Lit. Russian have it in a far less degree, and in S. Slavonic it is very little developed.

VI. Right across the Slavonic world from W. to E. *g* has become *h*, leaving the N. and the S. untouched. This change is found in Čech, Slovak, High but not Low Sorb, is traceable in Polish, and characteristic in White, South Gt. Russian and Lit. Russian, also in the Russian pronunciation of Ch. Slavonic. The *h* produced is rather the spirant *gh* than the true aspirate. Low Sorb, R., O.S., &c., *gora*, P. *góra*, "mountain." Č., Slovak, High Sorb, Wh. and Lit. R. *hora*.

g > h.

VII. Common Slav *je* and *ju* beginning a word appear in R. as *o* and *u*; O.S. *jedinŭ*, "one," *jucha*, "broth"; R. *odinŭ*, *ucha*.

VIII. Proto-Sl., as we have seen, had long, short and very short or half vowels and a musical accent with differing intonations. O.S. was probably similar, but we have no sufficient materials for determining its quantities or accents as systematic writing of the latter only came in from the 14th century. The fate of the half vowels we have seen (I.). Traces of former long vowels are very clearly to be seen in Sorb, Polish and Lit. R., and less clearly in Bulg. and Gt. R., all of which have lost distinctions of quantity; Slovene can have long vowels only under the accent. In Kašube, Č., Slovak and Serbo-Cr. there are also unaccented long syllables. Russian has kept the place of the original accent best, next to it Bulgarian; consequently it seems very capricious, appearing on different syllables in different flexions, but it has become merely expiratory. In Slovene it is still musical, but is, so to speak, steadier. For the intonations Serbo-Croat is the chief guide, but here the accent intonation is spread over two syllables, in Croatian (*ča* dialect), the main stress is usually on the old place, in Servian (*što* dialect) it has shifted back one. In N.W. Slavonic, with the exception of Kašube in which it is free, the accent is fixed, in Č., Slovak and Sorb on the first syllable of the word, in Polish on the penultimate.

Accent and quantity.

On the whole it may be said that the geographical classification of the Slavs into N.W., S. and E. Slavs is justified linguistically, though too much stress must not be laid upon it as the lines of division are made less definite by the approximation of the languages which come next each other, the special characteristics of each group are generally represented in dialects of the others if not in the written languages; also some peculiarities (*e.g.* VI., *g > h*) run right across all boundaries, and secondary softening runs from N. to S., becoming less as it goes away from Poland (V., *c*). In fact, the triple division might be purely arbitrary but for the fact that the belt of Germans, Magyars and Rumanians has made impossible the survival of transitional dialects connecting up Čech with Slovene, Slovak with Servian, Russian with Bulgarian. Slovak, as it were, just fails to be a universal link: in the north Russian and Polish have much in common, but Lithuania made some sort of barrier and the difference of religion favoured separate development.

In the north Polish is closely connected with Kašube, and this with Polab, making the group of L'ach dialects in which the nasals survived (IV.). The two Sorb dialects link the L'achs on to the Čechs and Slovaks, the whole making the N.W. group with its preference for *c*, *z*, *s* as against *č*, *ž*, *š* (which were perhaps unknown to Polab, V. *b*), its *b'* as against *bl'* (V. *e*), its keeping *kv'* and *gv'* (V. *a*), *tl* and *dl* (III. *c*), its *ř* (III. *a*, not in Slovak) and the fixed accent (VIII. not in Kaš.). The whole group (except Sorb) agrees with R. in having lost the aor. and impf. Yet Č. and Slovak agree with S. Slav. in *trat*, *trět* (III. *f*, ii.) in survival of *ŗ* and *ļ* (III. *d*) and of quantity (VIII.). Again, Slovene has occasional *tl*, *dl* (III. *c*), and its accent and quantity are not quite southerly, but its many dialects shade across to Croat and Servian, and they must all be classed together for the fate of *tj*, *dj* (V. *b*) and *ą*, *ę* (IV.). The Šopcy and Macedonians, among their numerous dialects, make a bridge between Servian and Bulgarian. The special mark of the latter is *tj*, *dj* > *št*, *žd*, which is the main philological argument for making O.S. Bulgarian. In general S. Slav. shows less soft letters than N.W. and E. (V. *c* and *d*). It shares with Russian *bl* < *bj* (V. *e*), *tl*, *dl* > *l* (III. *c*), *kv'*, *gv'* > *cv zv* (V. *a*) and the general loss of *ą*, *ę* (IV.), and is closer to it in the fate of *tj*, *dj* (V. *b*). Bulgarian, especially in some dialects, is, as it were, a transition to Russian, *e.g.* in accentuation.

Russian stands by itself by its *torot*, *tolot* (III. *f*, ii.) and its treatment of *tj* and *dj* (V. *b*) and the place of its accent (VIII.) in all of which it is rather archaic, while *je*>*o*, *ju*>*u* (VII.) is its own innovation. In its secondary softenings Lit. R., Gt. R. and Wh. R. make a gradual bridge between S. Slav and Polish (V. *c-e*). In common with Polish, R. further has the retention of *y* (II.) and the loss of the aor. and impf.

Finally, within historic time certain dialects have influenced others through literary and political intercourse. O.S. has influenced all the Orthodox Slavs and the Croats, so that Russian is full of words with O.S. forms pronounced *à la Russe* (*ą*>*u*, *ę*>*ja*, *št'*>*šč*, &c.). Čech has almost overshadowed Slovak and early afforded literary models to Polish. Polish has overshadowed Kašube and much influenced Little and White Russian and Great Russian in a less degree. Russian has in its turn supplied modern Bulgarian with a model. Again, other tongues have contributed something; in common Slavonic there are already German loan words, and others have followed in various periods, especially in Čech and Polish, while the very structure of Slovene and Sorb has been affected. Polish has adopted many Latin words. Bulgarian and Servian received many Turkish words. Russian took over many Eastern words in the Tatar period, and the common vocabulary of Western civilization since the time of Peter the Great, but on the whole, though the Slav easily takes to a fresh language, he has kept his own free from great admixture.

SLAVYANSK, a town of Russia, in the government of Kharkov, 158 m. by rail S.E. of the town of Kharkov, on the Torets river and close by several salt lakes, from which salt is extracted. Pop. (1897) 15,644. There are soap, candle and tallow-works. Slavyansk carries on a brisk trade in salt, cattle and tallow. The ancient name of Slavyansk was Tor. The town, which is supposed to occupy the site of a former settlement of the Torks (Turks), who inhabited the steppes of the Don, was founded in 1676 by the Russians to protect the salt marshes. Having an open steppe behind it, this fort was often destroyed by the Tatars. Its salt trade became insignificant in the 18th century and only revived towards the end of the 19th century.

SLEAFORD, a market town in the North Kesteven or Sleaford parliamentary division of Lincolnshire, England, in a fertile and partly fenny district on the river Slea. Pop. of urban district (1901) 5468. It is 112 m. N. by W. from London by the Great Northern railway, being the junction for several branch lines and for the March-Doncaster joint line of the Great Northern and Great Eastern companies. The church of St Denis is one of the finest in the county, exhibiting transitional Norman work in the base of the western tower, which is crowned by an Early English spire, which, however, is mainly a copy of the original. The nave is of beautiful late Decorated work with an ornate south porch. There is a splendid carved rood screen of oak. The chancel is Perpendicular. There are a few picturesque old houses. The district is very fertile, and the trade of the town is principally agricultural, while malting is also carried on.

The discovery of numerous coins of the Constantine period, the earthworks of the castle-area, and its proximity to the ford by which Ermine Street crossed the Witham, point to the probability of Sleaford (*Slaforde, Lafford*) being on the site of a Roman settlement or camp, and that the Saxons occupied the site before their conversion to Christianity is evident from the large cemetery discovered here. Domesday Book records that the manor had been held from the time of Edward the Confessor by the bishops of Lindsey, whose successors, the bishops of Lincoln, retained it until it was surrendered to the Crown in 1546. It soon afterwards passed to the family of Carr and from them, by marriage, in 1688 to John Hervey, afterwards earl of Bristol. The quadrilateral castle, with its square towers and massive keep, was built by Alexander, bishop of Lincoln, and became one of the chief episcopal strongholds. King John rested here in 1216 after his disastrous passage of the Wash, and in 1430 Bishop Richard Fleming died here. The castle was in good repair on its surrender in 1546, but was dismantled before 1600. Sleaford never became a municipal or parliamentary borough, and the government was manorial, the bishops possessing full jurisdiction. The townsfolk were, however, largely organized in the gilds of Corpus Christi, St John and Holy Trinity, accounts for which are extant from the year 1477. The origin of the markets and fairs is unknown, but in answer to a writ of *quo warranto* of the reign of Edward I., the bishop declared that they had been held from time immemorial.

See *Victoria County History, Lincolnshire*; G. W. Thomas, "On Excavations in an Anglo-Saxon Cemetery at Sleaford, Lincolnshire," *Archaeologia*, vol. i. (London, 1887); Edward Trollope, *Sleaford and the Wapentakes of Flaxwell and Aswardhurn in the county of Lincoln* (London, 1872).

SLEEMAN, SIR WILLIAM HENRY (1788–1856), Indian soldier and administrator, was born at Stratton, Cornwall, on the 8th of August 1788. He was the son of Philip Sleeman, yeoman and supervisor of excise. In 1809 he joined the Bengal army, served in the Nepal War (1814–1816), and in 1820 became assistant to the governor-general's agent in the Saugor and Nerbudda territories. He is best known for his suppression of the Thugs or religious murderers in India, becoming superintendent of the operations against them in 1835, and commissioner for the suppression of Thuggi and Dacoity in 1839. During these operations more than 1400 Thugs were hanged or transported for life, one of whom confessed to having committed over 700 murders. Detection was only possible by means of informers, for whose protection from the vengeance of their associates a special gaol was established at Jubbulpore. Sleeman was resident at Gwalior 1843–1849, and at Lucknow 1849–1856. He was opposed to the annexation of Oudh by Lord Dalhousie, but his advice was disregarded. He died at sea on his way home on the 10th of February 1856.

See Sir H. Sleeman, *Rambles and Recollections of an Indian Official* (1844; 2nd edition, 1893), and *A Journey through Oudh* (1858).

SLEEP (O. Eng. *slæpan*; Ger. *schlafen*; cf. Lat. *labi*, to glide, and "slip"), a normal condition of the body, occurring periodically, in which there is a greater or less degree of unconsciousness due to inactivity of the nervous system and more especially of the brain and spinal cord. It may be regarded as the condition of rest of the nervous system during which there is a renewal of the energy that has been expended in the hours of wakefulness; for in the nervous system the general law holds good that periods of physiological rest must alternate with periods of physiological activity, and, as the nervous system is the dominating mechanism in the body, when it reposes all the other systems enjoy the same condition to a greater or less extent. Rest alternates with work in all vital phenomena. After a muscle has contracted frequently at short intervals, a period of relaxation is necessary for the removal of waste products and the restitution of energy; the pulsating heart, apparently working without intermission, is in reality not doing so, as there are short intervals of relaxation between individual beats in which there is no expenditure of energy; the cells in a secreting gland do not always elaborate, but have periods when the protoplasm is comparatively at rest. Nervous action also involves physico-chemical changes of matter and the expenditure of energy. This is true even of the activity of the brain associated with sensation, perception, emotion, volition and other psychical phenomena, and therefore the higher nervous centres require rest, during which they are protected from the stream of impressions flowing in from the sense-organs, and in which waste matters are removed and the cerebral material is recuperated for another time of wakeful activity. (See also HYPNOTISM, and the physiological sections of the articles BRAIN, and MUSCLE AND NERVE.)

The coincidence of the time of sleep with the occurrence of the great terrestrial phenomena that cause night is more apparent than real. The oscillations of vital activity are not correlated to the terrestrial revolutions as effect and cause, but the occurrence of sleep, in the majority of cases, on the advent of night is largely the result of habit. Whilst the darkness and stillness of night are favourable to sleep, the state of physiological repose is determined more by the condition of the body itself. Fatigue will normally cause sleep at any time of the twenty-four hours. Thus many of the lower animals habitually sleep during the day and prowl in search of food in the night; some hibernate during the winter season, passing into long periods of sleep during both day and night; and men whose avocations require them to work during the night find that they can maintain health and activity by sleeping the requisite time during the day.

The approach of sleep is usually marked by a desire for sleep, or sleepiness, embracing an obscure and complicated group of sensations, resembling such bodily states of feeling as hunger, thirst, the necessity of breathing, &c. All of these bodily states, although on the whole ill-defined, are referred with some precision to special organs. Thus hunger, although due to a general bodily want, is referred to the stomach, thirst to the fauces, and breathing to the chest; and in like manner the desire for sleep is referred chiefly to the region of the head and neck. There is a sensation of weight in the upper eyelids, intermittent spasm of the sub-hyoid muscles causing yawning, and drooping of the head. Along with these signs there is obscuration of the intelligence, depression both of general sensibility and of the special senses, and relaxation of the muscular system. The half-closed eyelids tend more and more to close; the inspirations become slower and deeper; the muscles supporting the lower jaw become relaxed, so that the mouth opens; the muscles of the back of the neck that tend to support the head also relax and the chin droops on the breast; and the limbs relax and tend to fall into a line with the body. At the same time the hesitating utterances of the sleepy man indicate vagueness of thought, and external objects gradually cease to make an impression on the senses. These are the chief phenomena of the advent of sleep. After it has supervened there are many gradations in its depth and character. In some cases the sleep may be so light that the individual is partially conscious of external impressions and of the disordered trains of thought and feeling that pass through his mind, constituting dreams, and these may be more or less vivid, according to the degree of consciousness remaining. On the other hand, the sleep may be so profound as to abolish all psychical phenomena: there are no dreams, and when the sleeper awakes the time passed in this unconscious state is a blank. The first period of sleep is the most profound. After a variable period, usually from five to six hours of deep sleep, the faculties awaken, not simultaneously but often fitfully, so that there are transient periods of consciousness. This is the time of dreaming. As the period of waking approaches the sensibility becomes more acute, so that external impressions are faintly perceived. These impressions may influence and mould the flow of images in the mind of the sleeper, frequently altering the nature of his dreams or making them more vivid. The moment of waking is usually not instantaneous, but is preceded by an intermediate state of partial consciousness, and a strange play of the mental faculties that has more of the character of an "intellectual mirage" than of consecutive thought.

The intensity of sleep has been measured by Kohlschütter by the intensity of the sound necessary to awaken the sleeper. This intensity increases rapidly during the first hour, then decreases, sometimes rapidly, sometimes slowly, during the next two or three hours, and then very slowly until the time of waking. This statement agrees generally with experience. As a rule the deeper the sleep the longer it lasts.

Various physiological changes have been observed during sleep, but much remains to be done in this direction. The pulse becomes less frequent; the respiratory movements are fewer in number and are almost wholly thoracic, not abdominal; all the secretions are reduced in quantity; the gastric and intestinal peristaltic movements are less rapid; the pupils of the eye are contracted and during profound sleep are not affected by light; and the eyeballs are rotated upwards. The pupils dilate slightly when strong sensory or auditory stimuli are applied, and they dilate the more the lighter the sleep; at the moment of waking they become widely dilated. Whilst muscular relaxation is general, there seems to be increased contraction of certain sphincter muscles, as the circular fibres of the iris and the fibres concerned in closing the eyelids. The state of the circulation of the brain has been frequently investigated. The older view was that there was a degree of plethora or congestion of the vessels of the brain, as is the state of matters in coma, to which the state of sleep has a superficial resemblance. Coma, however, is not sleep, but a condition of inactivity of the cerebral matter owing to the accumulation of dark venous blood in its vessels. This has been actually observed in cases where it was possible to see the brain. During sleep the surface of the exposed brain has been observed to become pale and to shrink somewhat from the sides of the opening (Johann Blumenbach, 1752–1840). A careful experimental research was conducted by Arthur E. Durham in 1860, in which he trephined a portion of bone as large as a shilling from the parietal region of a dog, and, to obviate the effects of atmospheric pressure, inserted a watch glass into the aperture so that the surface of the brain could be seen. His results are summarized thus:—

"(1) Pressure of distended veins on the brain is not the cause of sleep, for during sleep the veins are not distended; and, when they are, symptoms and appearances arise which differ from those which characterize sleep. (2) During sleep the brain is in a comparatively bloodless condition, and the blood in the encephalic vessels is not only diminished in quantity, but moves with diminished rapidity. (3) The condition of the cerebral circulation during sleep is, from physical causes, that which is most favourable to the nutrition of the brain tissue; and, on the other hand, the condition which prevails during waking is associated with mental activity, because it is that which is most favourable to oxidation of the brain substance, and to various changes in its chemical constitution. (4) The blood which is derived from the brain during sleep is distributed to the alimentary and excretory organs. (5) Whatever increases the activity of the cerebral circulation tends to preserve wakefulness; and whatever decreases the activity of the cerebral circulation, and, at the same time, is not inconsistent with the general health of the body, tends to induce and favour sleep. Such circumstances may act primarily through the nervous or through the vascular system. Among those which act through the nervous system may be instanced the presence or absence of impressions upon the senses, and the presence or absence of exciting ideas. Among those which act through the vascular system may be mentioned unnaturally or naturally increased or decreased force or frequency of the heart's action."

Dr William A. Hammond and Dr Silas Weir Mitchell (b. 1830) repeated and extended Durham's observations, with the same general results (1866), and Ehrmann, Salathé (1877), François Franck (1877) and Mosso (1881), by more refined methods of observation arrived at the same general conclusions. Angelo Mosso (b. 1846) in particular applied with great success the graphic method of registration to the study of the movements of the brain and of the circulation during sleep. He made observations on three persons who had lost a portion of the cranial vault and in whom there was a soft pulsating cicatrix. They were a woman of thirty-seven years of age, a man of thirty-seven years and a child of about twelve years. By special arrangements, Mosso took simultaneous tracings of the pulse at the wrist, of the beat of the heart, of the movements of the wall of the chest in respiration, and of the movements of the denuded brain. Further, by means of the plethysmograph—an instrument of Mosso's own invention—he obtained tracings showing changes in the volume of the hand and forearm; and he succeeded in showing that during sleep there is a diminished amount of blood in the brain, and at the same time an increased amount in the extremities. He showed further that there are frequent adjustments in the distribution of the blood, even during sleep. Thus a strong stimulus to the skin or to a sense organ—but not strong enough to awaken the sleeper—caused a contraction of the vessels of the forearm, an increase of blood pressure, and a determination of blood towards the brain; and, on the other hand, on suddenly awakening the sleeper, there was a contraction of the vessels of the brain, a general rise of pressure, and an accelerated flow of blood through the hemispheres of the brain. So sensitive is the whole organism in this respect, even during sleep, that a loudly spoken word, a sound, a touch, the action of light or any moderate sensory impression modified the rhythm of respiration, determined a contraction of the vessels of the forearm, increased the general pressure of the blood, caused an increased flow to the brain, and quickened the frequency of the beats of the heart. These observations show how a physiological explanation can be suggested of the influence of external impressions in modifying the dreams of a sleeper. Further, Mosso found that during very profound sleep these oscillations disappear: the pulsatory movements are uniform and are not affected by sensory impressions, and probably this condition exists when there is the absolute unconsciousness of a " dead " sleep. By such methods as have been employed by Mosso, three movements of the brain have been observed—(1) *pulsations*, corresponding to the beats of the heart; (2) *oscillations*, or longer waves, sometimes coinciding with the heart beats, or more generally consisting of longer festoons, carrying each a number of smaller waves, and believed to correspond generally to the respiratory movements; and (3) *undulations*, still longer and less marked elevations and depressions, first clearly observed by Mosso, and believed by him to indicate rhythmic contractions of the vessels of the pia mater and of the brain. This view is in keeping with the observations of Franz Cornelius Donders (b. 1818), Adolf Kussmaul (b. 1822), Tenner and others on changes of calibre observed in the cerebral vessels, and with the experiments of many physiologists, showing that the vessels of the pia mater, like other vessels, are controlled by the vaso-motor system of nerves. It may therefore be considered certain that during sleep there is an anaemia, or partially bloodless condition, of the brain, and that the blood is drawn off to other organs, whilst at the same time this anaemic condition may be modified by changes in the circulation or in the respiratory mechanism caused by position, by sensory impressions or by sudden changes in the state of repose of the muscles. The examination of the retina (which may be regarded as a cerebral outwork) by the ophthalmoscope during sleep also shows a comparatively bloodless condition. Such are the facts; the deficiency in the way of a theoretical explanation is that physiologists cannot satisfactorily account for the anaemic condition causing unconsciousness. Sudden haemorrhage from the brain and nerve-centres, or a sudden cessation of the supply of blood to the brain, as occurs in syncope (failure of the heart's action—a faint), no doubt causes unconsciousness, but in these circumstances there is a tendency to convulsive spasm. Such spasm is usually absent in sleep, but sudden jerks of the limbs may sometimes be observed during the time when there is the confusion of ideas preceding the passage into sleep.

During sleep the amount of carbonic acid eliminated is very much reduced, indicating that molecular changes in the tissues do not occur to the same extent as in the waking state. This is also shown by the fact that less heat is produced. Hermann von Helmholtz (b. 1821) states that the amount of heat produced by a man weighing 67 kilogrammes (147·4℔) is about 40 calories per hour during sleep, as against 112 calories per hour while awake. This diminished production of heat may be largely accounted for by the quiet condition of the muscles of locomotion, but it also indicates diminished tissue changes throughout the body. In profound sleep the bodily temperature may fall from ·6° to ·2° Fahr. In consequence of diminished oxidation changes during sleep, it is not improbable that excess of nutrient matter may then be stored up in the form of fat, and that thus the proverb " He who sleeps dines " is based on a correct appreciation of the fact that sleep tends to produce plethora or obesity.

Whilst it is easy to state that sleep is caused by fatigue of the nervous system, it is more difficult to explain what the precise changes are that produce the state of unconsciousness. Various hypotheses have been advanced, but it cannot be said that any one is wholly satisfactory. Aware that the fatigue of muscle is associated with the accumulation of sarcolactic acid, Thierry William Preyer (b. 1841) surmised that the activity of nervous matter might be interfered with by the accumulation in the nerve-centres of some such acid, or of its soda salt (lactate of soda), but this view has not been supported by the results of experiment, as the injection into the blood of a dose of lactate of soda has not produced sleep. Pflüger has observed that frogs deprived for a considerable time of oxygen passed gradually into a state resembling profound sleep, and he has advanced the theory that there is no organ of the body so quickly affected by deprivation of oxygen as the brain. According to Eduard F. W. Pflüger (b. 1829), the phenomena of life depend on a dissociation of living matter, and in particular the activity of the cerebral substance connected with psychical states depends on dissociation changes in the grey matter. To excite the dissociation, however, oxygen is necessary. The oxygen unites with certain of the compounds set free by the dissociation, forming, amongst other substances, carbonic acid. If such matters as these that unite with oxygen are in sufficient amount to use up all the oxygen, the grey matter of the brain suffers from a deficiency of oxygen (or from its absence), and also from the accumulation of carbonic acid. According to such a theory, cerebral activity depends on cerebral respiration, and sleep is a kind of cerebral asphyxia. Some such condition is not improbable, but it must be stated that the evidence at present in support of it is meagre. Possibly, in attempting to account for the phenomenon of sleep, too much importance has been attributed to the changes occurring in the brain, forgetting that not merely brain matter but every tissue of the body becomes exhausted by work, and that sleep may be partly due to phenomena occurring throughout the body and not in the brain alone.

All the phenomena of sleep point to a diminished excitability of the cerebral nerve-centres and of the spinal cord. Contrary to what is often stated, there can be no doubt that reflex action is in partial abeyance and that the spinal cord is in a state of partial inactivity as well as the brain. The only nerve-centres that do not sleep are those absolutely essential to life, such as those connected with the heart, with respiratory movements, and with the distribution of blood by the vaso-motor arrangements; and Mosso's experiments indicate that even these have a certain amount of repose in profound sleep.

There is little doubt that all living beings require periods of repose alternating with periods of activity. Many plants close their flowers and bend their petioles at certain times of the day. These phenomena, called "the sleep of plants," depend apparently on changes in solar radiation, and there is no reason to believe that during the time of quiescence any reparative processes go on, as during the sleeping period of animals. Naturalists have observed many of the lower animals apparently in a state of sleep. Insects, crustaceans, fishes, reptiles, may all be observed occasionally to be almost motionless for considerable periods of time. The sleeping of birds is familiar to all, and in these there are anatomical arrangements by which the bird may, like the crane, sleep perched on one leg, or grasping a branch with both feet, like perching birds generally, without any muscular effort and consequently without fatigue.

The amount of sleep required by man varies according to age, sex and habit. The popular notion that a child sleeps half its time, an adult one-third, whilst an old person may do little except eat and sleep is not far wrong. In early life the cerebral faculties appear to be easily exhausted and during the frequent and prolonged sleeps of infancy the brain rests and the vegetative changes connected with nutrition and growth go on actively. As life advances, less sleep is required, until in adult life a period of seven or eight hours is sufficient. As a rule, women require more sleep than men, but much depends on habit. Thus most women bear the loss of sleep in the first instance better than men, because they have been accustomed more to loss or irregularity of sleep. The effect of habit is well seen in nurses, both male and female, who will often be able to work for weeks continuously with snatches of sleep, not amounting to more than two or three hours daily. Sooner or later, however, even in these cases nature asserts her demands, and prolonged sleep is necessary to maintain health and vigour. Wakefulness during the time when one ought to be asleep is frequently a distressing condition, undermining the strength and incapacitating for active and efficient work (see INSOMNIA).

It is a matter of common observation not only that certain persons require more sleep than others but that they have less power of resisting its onset and of awaking. This condition may become morbid, constituting a veritable nervous disease, to which the name "maladie du sommeil" or *hypnosia* may be given. It may be described as invincible sleep, and it may continue for weeks and for months, terminating in convulsive seizures, and even death. A persistent drooping of the upper eyelid has been observed even during waking hours. Dr W. Ogle has observed in such cases an engorgement of the cervical ganglia of the sympathetic; but this may have nothing to do with the condition. Cases of very prolonged sleep are not uncommon, especially amongst hysterical persons, lasting four, seven or ten days. On awaking the patient is exhausted and pale, with cold extremities, and not infrequently, after a brief interval of waking, passes off into another lethargic sleep. Something similar to this may be seen in very aged persons towards the close of life. (See also DREAMS, SOMNAMBULISM and HYPNOTISM.)

Among older works, see article "Sommeil" in the *Dictionnaire encyclopédique des sciences médicales*, where a bibliography is given and where also there is an account of the medico-legal questions connected with sleep and somnambulism; Macnish, *Physiology of Sleep*; Durham, "On the Physiology of Sleep," in Guy's *Hospital Reports* (1860); Kohlschütter, "Die Mechanik des Schlafes," in *Z. f. ration. Med.*, vol. xxxiii. (1869); Pflüger, "Theorie des Schlafes," in *Pflüger's Archiv*, vol. x. (1875); Mosso, *Über den Kreislauf des Blutes im menschlichen Gehirn* (Leipzig, 1881). Also Manacéïne, *Sleep, its Physiology, Pathology, Hygiene and Psychology* (Eng. trans. 1897), with bibliography. (J. G. M.)

SLEEPER, a term used with many technical applications for a piece of timber, metal, &c., used as a support; in carpentry it is such a piece of timber laid on low cross walls as a plate to receive ground joists; in shipbuilding, a strengthening timber for the bows and stern frame; the most frequent use of the term is for a timber or steel support on which the chairs are fixed for carrying the rails on a railway; in America these are called "ties" (see RAILWAYS). The common explanation of the origin of the word is to connect it with "sleep," the timbers supposed to be lying at rest. The real source of the word is the Norwegian *sleip*, a piece of timber used for dragging things over, a roller, especially used of timbers laid in a row in making a road. This word Skeat (*Etymol. Dict.*, 1898) connects with "slab," a flat piece of stone or wood. The French term *dormant* is used in carpentry, but as part of the frame of a window or door.

SLEEPING-SICKNESS (*Trypanosomiasis*), a remarkable parasitic disease, familiar among West African natives since the beginning of the 19th century, and characterized by protracted lethargy, fever and wasting. It is attributed to the *trypanosoma gambiense*, a parasite which was discovered in the frog by Gruby in 1847, and in 1880 by Griffith Evans in horses afflicted with the disease called "surra" in India. In 1895 Surgeon-Major (afterwards Sir) D. Bruce found a trypanosoma similar to Evans's in cases of what was known in cattle as "tsetse-fly disease"; and though the trypanosoma had not then actually been found in man, Bruce suggested that this was akin to the human "sleeping-sickness" which had now extended into the Congo Free State, Uganda and elsewhere, and was causing great mortality, many Europeans having died of the disease. In 1903 Castelani found the trypanosoma in the cerebro-spinal fluid of human patients afflicted with the disease. The question of the pathology of "sleeping-sickness" was vigorously taken up, and in June 1907 an international conference was held in London for the purpose of organizing research on the subject. As was pointed out by Lord Fitzmaurice (18th of June), in his opening address, it was already accepted that *trypanosoma gambiense* was the cause of the disease, and it was even then "all but proved" that the parasite was conveyed by at least one species of tsetse fly (*glossina palpalis*), the distribution of which was limited to the neighbourhood of open water. It had further been ascertained, experimentally in animals, and therapeutically in man, that the infection once acquired could be controlled, to some extent, by various substances—arsenic, certain colours, dyes, in combinations of arsenic and colour dyes, *e.g.* atoxyl—and by mercury. It remained a question how far certain unascertained factors were at work in the spread of the disease, and for this purpose the British government invited the co-operation of all the powers interested in tropical Africa in considering certain problems, annual or biennial conferences being suggested, and the formation of a central bureau, in order to organize the research. These problems were: (1) to determine whether the tsetse fly (*glossina palpalis*) was a direct or indirect conveyor of the parasite; (2) whether the parasite underwent necessary developmental changes in the tsetse fly; (3) if so, whether the developed germs were conveyed by the original fly or its larva when arrived at the imago stage; (4) how long an infected *glossina palpalis* remained infected; (5) whether other species of *glossina* were concerned; (6) the geographical distribution and habits of the fly; (7) whether and how far the spread of infection was the work of any of the vertebrate fauna (other than man); (8) to suggest preventive methods for exterminating the *glossina*, or protecting uninfected districts by segregation or otherwise; (9) to study the therapeutics of the disease. In the history of modern pathology, this organization of research in respect of "sleeping-sickness" must hold an important place as the application of state effort on behalf of the advancement of science. (See NEUROPATHOLOGY and PARASITIC DISEASES.)

Mott, *Archives of Neurology*, vol. iii. (1907); *Reports of the Sleeping-Sickness Commission*; Castellani, "Researches on the Aetiology of Sleeping-Sickness," *Journal of Tropical Medicine* (June 1903).

SLEET (either from Nor. *sletta*, of the same meaning, or related to Ger. *Schlosse*, hailstone), that form of precipitation of water vapour condensed from the atmosphere, which reaches the ground in a partly frozen condition. Sleet may originate in the upper atmosphere either as rain, in which case, to become partly frozen, it must have fallen into a stratum of air colder than that in which it originated, or as snow, when the opposite must have taken place, *i.e.* the snow in its descent must have encountered an air-temperature slightly above the freezing-point.

SLEEVE (O. Eng. *slieve*, *slyf*, a word allied to "slip," cf. Dutch *sloof*, apron), that part of a garment which covers the arm, or through which the arm passes or slips. The pattern of the sleeve is one of the characteristics of fashion in dress, varying in every country and period. Various survivals of the early forms of sleeve are still found in the different types of academic or other robes (*q.v.*). Where the long hanging sleeve is worn it has, as still in China and Japan, been used as a pocket, whence has come the phrase "to have up one's sleeve," to have something concealed ready to produce. There are many other proverbial and metaphorical expressions associated with the sleeve, such as "to wear one's heart upon one's sleeve," "to laugh in one's sleeve," &c. In technical usage a "sleeve" is a tube into which another tube is inserted, which in the case of small tubes is called a thimble.

SLEIDANUS, JOHANNES (1506–1556), German historian, the annalist of the Reformation, was born at Schleiden near Aix-la-Chapelle. He studied ancient languages and literatures at Liége and Cologne, and law and jurisprudence at Paris and Orleans. Whilst among the humanists of Liége, he had adopted Protestant opinions, and entering the service of Cardinal du Bellay, was employed in the futile negotiations of the French court to make an alliance with the German Protestants against the emperor Charles V. In 1542 he settled at Strassburg. Sleidanus had been accustomed to copy all papers bearing upon the Reformation to which he had access, and Martin Bucer, who had seen his collection, proposed to Philip of Hesse to appoint him historian of the Reformation, giving him a salary and access to all necessary documents. After some delay the heads of the league of Schmalkalden agreed to the proposal, and Sleidanus began his great work, finishing the first volume in 1545. In that year he was recalled to diplomacy, and went to England in a French embassy to Henry VIII. While there he collected materials for his history. On his return he represented Strassburg at the diets of Frankfort and Worms, and went on to Marburg to explore the archives of Philip of Hesse. The war of the league of Schmalkalden interfered with this work, and also prevented the payment of Sleidanus, who in his difficulties applied to England for aid, and at Cranmer's intercession received a yearly pension from Edward VI., which, however, was not long continued. In 1551 Sleidanus went to the council of Trent as representative from Strassburg, charged also with full powers to act for the imperial cities of Esslingen, Ravensburg, Reutlingen, Biberach and Lindau. He was afterwards appointed professor of law in Strassburg, and finished his great task in 1554, though lack of money and other misfortunes compelled him to delay printing. Sleidanus died in poverty at Strassburg in October 1556. The book appeared in the preceding year—*Commentariorum de statu religionis et reipublicae, Carolo V. Caesare, libri XXVI.*; it was translated into English by John Daws in 1560 and by G. Bohum in 1689. It was so impartial that it pleased no one, not even Melanchthon. It remains the most valuable contemporary history of the times of the Reformation, and contains the largest collection of important documents.

See H. Baumgarten, *Über Sleidanus Leben und Briefwechsel* (1878), and *Sleidans Briefwechsel* (1881); and A. Hasenclever, *Sleidan-Studien* (Bonn, 1905).

SLEIGH, Sled or Sledge (Dan. *slaede*, Dutch *slede*, akin to "slide"), a vehicle on runners instead of wheels, for travelling over snow or ice. Various forms are used according as the object is utility or sport. The sleighs used in Coasting are referred to in the article under that heading; but for ordinary means of conveyance horse-drawn sleighs are employed as carriages in countries such as Russia, Scandinavia, and North America, where the roads are snow-bound in the cold season; and in the Arctic regions dogs are harnessed to them.

SLIDELL, JOHN (1793–1871), American political leader and diplomatist, was born in New York City in 1793. He graduated from Columbia College in 1810, engaged in business for a short time, then studied law, and became one of the leaders of the bar at New Orleans, Louisiana, where he settled permanently in 1825. He was a member of the national House of Representatives as a state's rights Democrat from 1843 to 1845, when he resigned and was sent by President Polk on a secret mission to Mexico, with power to adjust the difficulties growing out of the annexation of Texas to the United States, and to acquire by purchase both New Mexico (including the present Arizona) and Upper California. He was not, however, received by the Mexican government. From 1853 to 1861 he was a representative of Louisiana in the United States Senate, and was an influential working member of important committees, though he seldom took part in debate. During this period he was intimately associated with James Buchanan, and is supposed to have had an important part in bringing about Buchanan's nomination for the presidency in 1856. When Louisiana seceded in 1861, Slidell withdrew from the Senate, and late in 1861 was sent by the Confederate Government as commissioner to France. With James M. Mason (*q.v.*), the Confederate commissioner to England, he was taken from the British steamer "Trent" by Captain Charles Wilkes of the United States navy, and was imprisoned at Fort Warren in Boston harbour. In January 1862, at the demand of England, the Confederate commissioners were released, and Slidell proceeded to France. His mission there was to secure the recognition of the Confederate States; in this he was unsuccessful, but he was able to keep France sympathetic, and to help to secure supplies for the Confederate army and navy. After the war he remained abroad, settling in England, and his daughter married a French nobleman. He died in London on the 29th of July 1871.

SLIGO, a county of Ireland in the province of Connaught, bounded N. by the Atlantic, E. by Leitrim, S.E. by Roscommon, and S. and W. by Mayo. The area is 452,356 acres or about 707 sq. m. The coast-line is very irregular, and in some places rises into grand escarpments and terraces. The principal inlets are Killala Bay and Sligo Bay, the latter subdivided into Brown Bay, Drumcliffe Bay and Ballysadare Bay. Near the coast are the islands of Inishmurray and Coney and other smaller islets. Though Sligo cannot be compared for scenery with the western parts and north coast of County Mayo, it is well wooded and possesses several beautiful lakes and rivers and some ranges of hills finely situated and grouped. In the north are the limestone elevations of Ben Bulbin (1712 ft.) and Knocknarea (1078), contrasting with the adjacent rugged gneiss mountains, among which are King's Mountain (1527) and Gullogherboy (1430). On the boundary with Leitrim, Trùskmore reaches a height of 2113 ft. In the west are the ranges of the Slieve Gamph and Ox Mountains, upwards of 1300 and 1600 ft. respectively. The Curlew Mountains, an abrupt ridge of limestone gravel, upwards of 800 ft. in height, with flattened summit, separate Sligo from Roscommon. The principal rivers are the Moy, forming for a part of its course the boundary with Mayo, and flowing southwestward and then northward into Killala Bay; the Easky, flowing northward from Lough Easky; and Ballysadare, with its branches the Owenmore, Owenbeg, and Arrow, or Unshin; and the Garvogue, or Garavogue, flowing from Lough Gill. Except the finely-situated Lough Gill (extending into Leitrim), Lough Arrow, and Lough Gara, all of which exceed 3000 acres in extent, none of the lakes has so large an area as 400 acres. The salmon, sea-trout and trout fishing is generally excellent in these waters, especially during the autumn, but Lough Arrow also provides sport during the Mayfly season.

This county essentially consists of Carboniferous Limestone, broken by the Dalradian axis of the Ox Mountains. The gneisses of this range, which obviously result from the intermingling of granite and a series of schists and quartzites, form a ridge of rocky hills, smoothed by glaciation, on the flanks of which Carboniferous shales rest. Above these, the limestone is boldly developed, forming great scarped tablelands north of Sligo, with some sandstone on the summit of Truskmore. Knocknarea, conspicuous from Sligo, is an outlier of the Upper Limestone. Lough Gill is picturesquely bounded by the gneissic range on the south and these high carboniferous masses on the north. The limestone also produces fine features in the south of the county, in Keishcorran and round Lough Arrow. East of this point, it forms the slopes of the Leitrim and Roscommon coalfield, the summits being capped by the Millstone Grit series; while on the south, bounded by a fault, rises the Old Red Sandstone range of the Curlew Hills. Lead was mined at Ballysadare, and the clay-ironstone from the east of the county was at one time smelted.

Industries.—There is considerable variety both in the character of the soil and in the agricultural advancement in different parts of the county. In some parts it is a light sandy loam resting on a freestone bottom, and in the lower districts a rich and deep mould prevails resting on a substratum of limestone. Owing to the moistness of the climate cattle feeding is found to be the most remunerative method of farming, as may be gathered from the increasing or well-maintained numbers of cattle, sheep and poultry. Oats and potatoes are the principal crops, but the acreage devoted to them decreases, and the proportion of tillage to pasturage is roughly as 1 to 3½. Coarse woollens and linens are manufactured for home consumption, and there are tanneries, distilleries, and breweries in the principal towns. A considerable general trade is carried on at the ports of Ballina (on the Moy) and Sligo. The fisheries on the coast are valuable, and there are important salmon fisheries at the mouths of the rivers. The town of Sligo is the chief centre.

The Sligo branch of the Midland Great Western railway enters the county from the S.E., with a branch S.W. from Kilfree to Ballaghaderreen in county Mayo; the Limerick and Sligo line of the Great Southern and Western enters from S.W.; and the Sligo, Leitrim and Northern counties, from Enniskillen (county Fermanagh), and Manor Hamilton (county Leitrim), from the N.E. These lines unite at Collooney and share the railway from this junction to the town of Sligo.

Population and Administration.—The population (94,416 in 1891, 84,083 in 1901) decreases at a rate considerably above the average of the Irish counties, and emigration is heavy. Of the total about 90% are Roman Catholics and about 7% Protestant Episcopalians. About 88% is rural population. The county town is Sligo (pop. 10,870); Ballymote and Tobercurry (or Tubbercurry) are small inland market towns. The county is divided into six baronies. Assizes are held at Sligo and quarter-sessions at Ballymote, Easky and Sligo. For parliamentary representation the county has since 1885 formed two divisions (North and South), each returning a member. The county is mainly in the Protestant diocese of Kilmore, and in the Roman Catholic dioceses of Ardagh, Achonry, Elphin and Killala.

History.—The county was created by Sir Henry Sydney in 1579. On Carrowmore, between Sligo and Ballysadare, there is a remarkable collection of ancient stone monuments (see SLIGO, town). At Drumcliffe (5 m. N. of Sligo) are the only round tower remaining in the county and a beautiful Celtic cross 13 ft. in height. The principal monastic ruins are the abbey of St Fechan at Ballysadare, with a church of the 11th or 12th century; the abbey of Sligo; and a remarkable group of buildings on the island Inishmurray, which include a cashel or walled enclosure; three oratories, one of which contains an oaken figure in ecclesiastical garb; two holy wells; and also altars, pillar stones, inscribed slabs (one of which is unique among those of its kind in Ireland in having an inscription partly in Latin), and several examples of beehive cells. This settlement is associated with Molaise, a saint of the early 6th century (not identical with the Molaise of Devenish in Loch Erne), and the remains still attract pilgrims, who revere the oaken figure mentioned as an image of the saint, though it is more probably the figurehead of a vessel.

SLIGO, a municipal borough, seaport and market town, and the county town of county Sligo, Ireland. Pop. (1901) 10,870. It lies at the head of an arm of Sligo Bay on the north-west coast, on the river Garvogue, 134¼ m. N.W. from Dublin by the Midland Great Western railway. This company shares with the Great Southern and Western and the Sligo, Leitrim, and Northern Counties railways the line to Collooney Junction, 6½ m. S., from which the former runs S. to Limerick and the latter E. to Enniskillen. The situation of Sligo is beautiful; the bay is separated from the fine Lough Gill by less than 4 m. of a richly wooded valley, with flanking hills exceeding 1000 ft. in elevation. Sligo takes rank with Galway and Limerick as one of the three principal ports of the west coast of Ireland. Regular communication by steamer is maintained with Liverpool and Glasgow, and a considerable export trade is carried on in grain, flour, pork and cattle; while coals, iron, timber and provisions are imported. There is a depth on the harbour bar of 16 ft. at low water, and there are commodious quays and basins. Harbour commissioners control the port. Brewing, flour-milling and saw-milling are the chief industries, and there is an important butter-market. Monthly fairs are held. Sligo is a centre of salmon and sea-fishing industries.

The Dominican Abbey, founded in 1252 by Maurice Fitzgerald, Lord-Justice, is one of the finest monastic ruins in Ireland. It was partly destroyed by fire in 1414 and again in 1642. Three sides of the cloisters remain, and the lofty quadrangular tower at the junction of the nave and chancel is entire. The east window is of the date of the original structure. The principal modern church is the Roman Catholic cathedral (1869) for the diocese of Elphin in the Norman style with a finely sculptured doorway. There is also a Roman Catholic college.

A castle was built at Sligo by Maurice Fitzgerald in 1242, which in 1270 was taken and destroyed by O'Donnel; in 1310 it was rebuilt by Richard, earl of Ulster, and was again partly destroyed in 1369 and 1394. Of this and the walls with which the town was fortified there are no remains. Early in the reign of James I. the town received a market and two annual fairs; in 1613 it was incorporated and received the privileges of a borough; and in 1621 it received a charter of the staple. In 1641 it was besieged by the Parliamentary forces under Sir Charles Coote, but was afterwards evacuated, and occupied by the Royalists till the termination of the war. In 1688 it declared in favour of James II., and, after being captured by the Enniskilleners, was retaken by General Sarsfield, but ultimately surrendered to the earl of Granard. The borough was disfranchised in 1870. Under the Local Government (Ireland) Act, 1898 it retains its mayor and corporation, but the latter has practically the status of an urban district council.

The country neighbouring to Sligo presents fine coast scenery, west coast of Ireland, while inland it is wild and mountainous. Three m. S.W. of the town, on Carrowmore, is a remarkable collection of megalithic remains, including cromlechs, stone circles, and burial cairns, which has been taken to mark the site of the traditional battle of North Moytura. On Knocknarea (1078 ft.), south of Sligo, is a huge cairn, which tradition sets down as the burial-place of Queen Mab (Meave of Connaught). Five m. N. of Sligo is Drumcliffe, with its round tower and Celtic cross. Rosses, on Sligo Bay, is a favourite resort. Sligo is a centre for salmon and trout fishing.

SLING (from M. Eng. *slingen*, to fling, throw with a jerk, Icel. *slyngva*, cf. Ger. *schlingen*, to twist), an implement for casting missiles, also from its resemblance in form to the implement, a hanging loop used as a support for a wounded limb, a chain with hooks used for raising or lowering heavy goods or objects, &c. The sling as a weapon is probably the earliest form of device known to mankind by which an increase of force and range was given to the arm of a thrower of missiles. Sling stones from the stone age have been frequently found (see ARMS AND ARMOUR). The form of the weapon is of two kinds; the sling proper consists of a small strap or socket of leather or hide to which two cords are attached; the slinger holds the two ends in one hand, whirls the socket and missile rapidly round the head and, loosing one cord sharply, despatches the missile; the other type is the staff sling, in which the sling itself is attached to a short staff, held in both hands. This was used for heavier missiles especially in siege operations during the middle ages. There are many references to slings and to slingers in the Bible; the left-handed slingers of Benjamin were famous (Judges xx. 16). The Assyrian monuments show the sling of the ordinary type and slingers were used in the ancient Egyptian army, but not before the 8th century B.C. The sling (Gr. σφενδόνη, Lat. *funda*) is not mentioned in Homer; Herodotus (vii. 158) speaks of the slingers in the army offered by Gelon to serve against the Persians; it seems to have been a weapon chiefly used by barbarian troops. The Acarnanians, however, were expert slingers (Thuc. ii. 81), and so also were the Achaeans, who later invented the sling which discharged a shaft with an iron bolt head (Livy xlii. 65, from Polybius). In the Roman army by the time of the Punic Wars the slingers (*funditores*) were auxiliaries from Greece, Syria and Africa. The Balearic islanders, who were in Hannibal's army, were always famous as slingers. In medieval times the sling was much used in the Frankish army, especially in defending trenches, while the staff-sling was used against fortifications in the 14th century. They were used down to the 16th and 17th centuries to throw grenades.

SLIVEN, SLIVNO or formerly SELIMNIA (Turk. *Islimye*), a town of Bulgaria, in Eastern Rumelia, at the southern foot of the Balkan Mountains, 105 m. E.N.E. of Philippopolis and near the southern entrance of the defile known as the Iron Gate. Pop. (1906), 25,049. There are numerous mosques in the town, but the greater part of the Turkish population emigrated after the Russo-Turkish War of 1877–78. Sliven contains the government factory, founded in 1834, for the manufacture of military clothing; it is the chief centre in Bulgaria for the rough and fine homespuns known as *aba* and *shayak*, and its wine is locally celebrated. Extensive mulberry orchards have been planted in connexion with the silk industry.

Sliven, the Stlifanos of the Byzantine writers, owed its former strategic importance to its position on one of the trans-Balkan highways to Adrianople and the south. In the middle ages it was a subject of dispute between Byzantium and Bulgaria. After its capture by the Turks (1388) it was one of the *voinik* towns which remained exempt from taxes and were allowed to elect their own voivode; but these privileges were lost in the 16th century. In 1829 Sliven was occupied by the Russian army under Rudiger and Gorchakov.

SLOANE, SIR HANS (1660–1753), British collector and physician, was born on the 16th of April 1660 at Killyleagh in county Down, Ireland, where his father had settled at the head of a Scotch colony sent over by James I. He had as a youth a taste for collecting objects of natural history and other curiosities. This led him to the study of medicine, which he went to London to pursue, directing his attention to botany, materia medica and pharmacy. His collecting propensities made him useful to John Ray and Robert Boyle. After four years in London he travelled through France, spending some time at Paris and Montpellier, and taking his M.D. degree at the university of Orange in 1683. He returned to London with a considerable collection of plants and other curiosities, of which the former were sent to Ray and utilized by him for his *History of Plants*. Sloane was quickly elected into the Royal Society, and at the same time he attracted the notice of Thomas Sydenham, who gave him valuable introductions to practice. In 1687 he became fellow of the College of Physicians, and proceeded to Jamaica the same year as physician in the suite of the duke of Albemarle. The duke died soon after landing, and Sloane's visit lasted only fifteen months; but during that time he got together about 800 new species of plants, the island being virgin ground to the botanist. Of these he published an elaborate catalogue in Latin in 1696; and at a later date (1707–1725) he made the experiences of his visit the subject of two folio volumes. He became secretary to the Royal Society in 1693, and edited the *Philosophical Transactions* for twenty years. His practice as a physician among the upper classes was large. In the pamphlets written concerning the sale by Dr William Cockburn (1669–1739) of his secret remedy for dysentery and other fluxes, it was stated for the defence that Sloane himself did not disdain the same kind of professional conduct; and some colour is given to that charge by the fact that his only medical publication, an *Account of a Medicine for Soreness, Weakness and other Distempers of the Eyes* (London, 1745) was not given to the world until its author was in his eighty-fifth year and had retired from practice.

In 1716 Sloane was created a baronet, being the first medical practitioner to receive an hereditary title, and in 1719 he became president of the College of Physicians, holding the office sixteen years. In 1722 he was appointed physician-general to the army, and in 1727 first physician to George II. In 1727 also he succeeded Sir Isaac Newton in the presidential chair of the Royal Society; he retired from it at the age of eighty. Sloane's memory survives more by his judicious investments than by anything that he contributed to the subject matter of natural science or even of his own profession. His purchase of the manor of Chelsea in 1712 has perpetuated his memory in the name of a "place," a street, and a square. His great stroke as a collector was to acquire (by bequest, conditional on paying off certain debts) in 1701 the cabinet of William Courten, who had made collecting the business of his life. When Sloane retired from active work in 1741 his library and cabinet of curiosities, which he took with him from Bloomsbury to his house in Chelsea, had grown to be of unique value. On his death on the 11th of January 1753 he bequeathed his books, manuscripts, prints, drawings, pictures, medals, coins, seals, cameos and other curiosities to the nation, on condition that parliament should pay to his executors £20,000, which was a good deal less than the value of the collection. The bequest was accepted on those terms by an act passed the same year, and the collection, together with George II.'s royal library, &c., was opened to the public at Bloomsbury as the British Museum in 1759. Among his other acts of munificence may be mentioned his gift to the Apothecaries' Company of the botanical or physic garden, which they had rented from the Chelsea estate since 1673.

See Weld, *History of the Royal Society*, i. 450 (London, 1848); and Munk, *Roll of the College of Physicians*, 2nd ed., i. 466 (London, 1878).

SLOCUM, HENRY WARNER (1827–1894), American general, was born at Delphi, Onondaga county, New York, on the 24th of September 1827, and graduated at the United States Military Academy in 1852. He resigned from the army in 1856 to practise law at Syracuse, N.Y., and in 1859 he was a member of the state Assembly. When the Civil War broke out he became colonel (May 1861) of the 27th New York Volunteers, and was promoted brigadier-general of volunteers (August 1861) and major-general of volunteers (July 1862). He fought in all the Virginia campaigns from the first battle of Bull Run, where he led a regiment, to Gettysburg, where he commanded the XII. corps. With that corps he was transferred in the autumn of 1863 under Hooker's command to the Tennessee Valley, and took part in the battle of Chattanooga. He remained with the Army of the Cumberland after his corps was merged into that of Hooker, took part in the Atlanta campaign, and after Hooker's retirement succeeded to the command of the XX. corps (late XI. and XII.). He commanded the Atlanta garrison, and with Sherman took part in the "march to the sea," and subsequently in the Carolinas campaign from Savannah to Goldsboro, as commander of the left wing. He resigned from the army in September 1865, resumed professional practice at Brooklyn, and was a Democratic representative in Congress in 1869–1873 and again in 1883–1885. In 1876–1884 he was president of the Brooklyn city board of public works. He died at Brooklyn on the 14th of April 1894. A monument of General Slocum by Frederick MacMonnies was unveiled at Brooklyn, N.Y., on the 30th of May 1905.

SLODTZ, RENÉ MICHEL or **MICHEL ANGE** (1705–1764), French sculptor, was born at Paris. He passed seventeen years at Rome, where he was chosen to execute a statue of St Bruno, one of the best modern works of the class in St Peter's. He was also the sculptor of the tomb of Marquis Capponi in St John of the Florentines. Other works of his are to be seen at the church of St Louis of France and at Santa Maria della Scala. After his return to France in 1747, Slodtz, in conjunction with his brothers, Antoine Sébastien and Paul, produced many decorative works in the churches of Paris, and, though much has been destroyed, his most considerable achievement—the tomb of Languet de Gergy in St Sulpice (commissioned in 1750)—still exists. Slodtz was, like his brothers, a member of the Academy of Painting and Sculpture, and many particulars of his life are preserved in a memoir written by Cochin, and also in a letter from the same to the *Gazette littéraire*, which was reproduced by Castilhon in the *Nécrologe* of 1766.

Slodtz's father, Sébastien (1655–1726), was also a sculptor, born at Antwerp; he became a pupil of Girardon and worked mostly under him at Versailles and the Tuileries. His chief works were "Hannibal" in the Tuileries garden, a statue of St Ambrose in the Palais des Invalides, and a bas-relief "Saint Louis sending missionaries to India."

See C. N. Cochin, *Mém. inéd.* (Paris, 1881); Barbet de Jouy, *Sculpture moderne du Louvre* (Paris, 1856); Duissieux, *Artistes français à l'étranger* (Paris, 1852).

SLOGAN, the war-cry of the Highland clans. It was the gathering call of the clan, often the name of the clan, the place of meeting, and the like, and was uttered when charging in battle. The Gaelic word, of which "slogan" is the English adaptation, is *sluagh-ghairm*, from *sluagh*, army, host, and *gairm*, call, cry. A variant form of "slogan" is "slogorne," which has given rise to an invented word "slughorn," used by Chatterton (*Battle of Hastings*, ii. 10) and by Browning (Childe Roland) as if the term meant some kind of war-trumpet or horn. Skeat (*Etym. Dict.* 1898, *Errata and Addenda*) has shown that Chatterton used an edition of Gavin Douglas's translation of Virgil, where "slogorne" is spelled "slughorne," and the context, "The deaucht trumpet blawis the brag of were; the slughorne, enseule or the wache cry went for the battall all suld be reddy," misled him.

SLONIM, a town of Russia, in the government of Grodno, 155 m. by rail S.E. of the city of Grodno and 20 m. from the railway from Moscow to Warsaw, on the high craggy banks of the Shchara. Pop. (1883), 21,110; (1897) 15,893, including many Jews. It derives its importance from the river, which is navigable and joins the Oginsky canal, connecting the Niemen with the Dnieper. Corn, tar, and especially timber are exported. Slonim is mentioned in 1040, when Yaroslav, prince of Kiev, defeated the Lithuanians in its neighbourhood. In 1241 the Mongols pillaged it and burned its wooden fort. Owing to its position between Galician Russia and Lithuania it often changed hands, until it was conquered by the Lithuanians in the 14th century. From 1631 to 1685 it was the seat of the Lithuanian diet and became a flourishing city. In the 18th century, under the hetman Oginsky, a canal was dug to connect the Shchara with the Dnieper. Oginsky embellished the city and founded there a printing-office. Russia annexed the town in 1795.

SLOOP, a type of small sailing-vessels which have one mast rigged "fore and aft," carrying a mainsail, gaff-topsail, jib and fore staysail. There is little in rig to distinguish a sloop from a "cutter," and the terms are used indiscriminately; sometimes a distinction is drawn by a sloop having a fixed and a cutter a running bowsprit. In the sailing and early steam days of naval warfare, a "sloop" was a small corvette, ship-rigged, with all the guns mounted on the upper deck. Like so many nautical terms the word was borrowed from the Dutch, viz. *sloep*, boat. This is generally taken to be an adaptation of the Fr. *chaloupe*, Span. and Port. *chalupa*, cf. Ital. *scialuppa*, Eng. "shallop," a light boat. These probably represent some native word borrowed by Spanish or Portuguese sailors in the East or American Indies. Other etymologists distinguish the Dutch and French words and refer *sloep* to the common Teutonic root, meaning to glide, to creep, seen in "slip," Ger. *schleifen*, *schliefen*, &c.

SLOTH, the name for the various representatives of a group of arboreal tropical American mammals belonging to the order Edentata (*q.v.*). Sloths are some of the most completely arboreal of all mammals, living entirely among the branches of trees; and usually hanging beneath them, back downwards, and clinging with the hook-line organs to which the terminations of their limbs are reduced. When obliged to descend to the ground, which they rarely, if ever, do voluntarily, sloths—owing to the unequal length of their limbs and the peculiar conformation of their feet, which allow the animals to rest only on the outer edge—crawl along a level surface with considerable difficulty. Though generally slow and inactive, even when in their natural haunts, they can on occasions travel with considerable rapidity along the branches, and as they do not leap, like most other arboreal creatures, they avail themselves of the swaying of the boughs by the wind to pass from tree to tree. They feed on leaves and young shoots and fruits, which they gather in their mouth, the fore-limbs aiding in dragging boughs within reach, but not being used as hands. When sleeping, sloths roll themselves up in a ball, and, owing to the dry shaggy character of their hair, are inconspicuous among the mosses and lichens with which the trees of their native forests abound. The concealment thus afforded is heightened in some species by the peculiar greenish tint of the hair, due not to the colour of the hair itself, but to the presence upon its surface of an alga, the lodgment of which is facilitated by the fluted or rough surface of the exterior, and its growth is promoted by the dampness of the atmosphere in the gloomy tropical forests. Sloths are

The Unau or Two-toed Sloth (*Choloepus hoffmanni*).

nocturnal, silent, inoffensive and solitary animals, and produce usually but one young at birth. They appear to show an almost reptilian tenacity of life, surviving the most severe injuries and large doses of poisons, and exhibiting longer persistence of irritability of muscular tissue after death than other mammals. Several other animals, such as the African potto-lemurs, and the Asiatic lorises, are popularly called sloths.

SLOUGH, a market town in the Wycombe parliamentary division of Buckinghamshire, England, 18 m. W. of London by the Great Western railway. Pop. of urban district (1901), 11,453. It lies in the flat valley of the Thames, nearly 2 m. from the river at Eton and Windsor, and is wholly modern in appearance. The chief public building is the Leopold Institute and Public Hall (1887), a memorial of Prince Leopold, Duke of Albany. The British Orphan Asylum is also in the town. The parish church of Upton-cum-Chalvey, St Laurence, has a Norman doorway and other portions of the same period. It is the burial-place of Sir William Herschel, who lived in the vicinity, set up his great telescope here, and made many of his astronomical discoveries.

SLOVAKS (*Slovák*, fem. *Slovenka*, adj. *slovenský*, formerly called *Slovene*, but to be distinguished from the Slovenes of Carinthia, in Magyar *Tót*), a Slav people numbering about 2,500,000 and mostly living in the northern counties of Hungary. On the west they extend into the neighbouring districts of Lower Austria and Moravia where they march with the Germans and the kindred Moravians, being bounded by the river Morava and the Jablunka Mountains; on the north they touch the Poles along the frontiers of Silesia and Galicia; on the east about 22° E. they meet the Little Russians along an indented boundary; on the south they have the Magyars as neighbours along a line joining Pressburg and Zemplín. Within these limits, save for the Germans in the towns, the Slovaks are not much mixed: they have isolated settlements throughout the western half of Hungary extending far enough south to meet similar settlements of Servians. Their chief centre is S. Marton on the Turocz. The Slovaks seem to have occupied this territory in the 5th or 6th century A.D. and also to have stretched far to the south; they formed part of Samo's empire (middle of 7th century), but were subject to the Avars and the Franks, and then formed part of Great Moravia until that kingdom was in 907 conquered by the Magyars, who displaced or assimilated the southern Slovaks and have ever since been lords of the rest, save for a short time when they were under Boleslav the Brave (A.D. 973) of Poland, and early in the 14th century when a local magnate, Count Matthew of Trenčín, made himself an independent ruler. In 1848–1849, when the Magyars rose against Austria, the Slovaks rose against the Magyars, but were handed back to them on the conclusion of peace. The Magyars have always treated the Slovaks as an inferior race and have succeeded in assimilating many districts where the prefix Tôt in place-names shows the former presence of Slovaks: those who take the Magyar language and attitude are called Magyarones. The Magyars, in pursuance of this policy, do their best to suppress the Slovak nationality in every way, even to the extent of taking away Slovak children to be brought up as Magyars, and denying them the right to use their language in church and school. The result is a large emigration to America. (See letters by Scotus Viator in *Spectator*, 1906 sqq.)

The Slovaks are a peaceful, rather slow race of peasants (their aristocracy is Magyarized), living almost exclusively upon the land, which they till after the most primitive methods. Wherc this does not yield sufficient, they wander as labourers and especially as tinkers all ovcr Austria-Hungary and even into South Russia. They are fond of music, and their songs have been collected.

The Slovak language is most closely connected with Čech, the difference being bridged by the transitional dialects of Moravia: though Miklosich has classed it as a variety of Čech, it is better to take it separately, since it has not been subjected to the special changes which have in that language assimilated the vowels to the foregoing palatal consonants, nor developed the *ř* which is characteristic of the other North-Western Slavonic tongues, but has remained in a more primitive stage and preserved (as might be expected from its central position in the Slavonic world) many points of agreement, phonetic, morphological and lexical, with South Slavonic and Russian. The alphabet is founded on the Čech, the accent is always on the first syllable, long vowels are indicated by acute accents. There are usually reckoned to be three groups of dialects, Western, Central and Eastern; the first being nearest to Čech, the last to Little Russian; the Central dialects exhibit less decided features. The Slovak dialects spoken in Moravia have been well investigated by Bartoš, the others still await satisfactory treatment, as does the question of the relation of Slovak to other Slavonic groups.

From the time of the Hussites and still more after the Reformation, Čech missionaries, colonists and refugees had brought with them their Bible and service books; Čech became the literary language, and is still the church language of the Slovak Protestants. The use of the local tongue was the result of a desire on the part of the Roman Catholic clergy to get at their people. A. Bernolák (1762–1813), who first systematized the orthography and made a dictionary, taking Western Slovak as his basis, was a priest, and so was Jan Holly (1785–1849), who wrote epics and odes in the classical taste. A new start was made in the 'forties by L'udevit Štúr, Josef Hurban and M. Hodža who adopted the central dialect, united the Catholic and Protestant Slovaks in its use and successfully opposed the attempts to keep the Slovaks to the use of Čech. However, Šafařík the great Slavist and the poet Kollár continued to write in Čech, the argument being that Slavs should unite to oppose the enemies of the race: but without their language the Slovaks, having no traditions of independent political life, would have nothing to cling to. The chief Slovak writers since Štur (mostly poets) have been O. Sladkovič, S. Chalupka, V. Pauliny-Tót, and at present Ország-Hviezdoslav and Svetozár Hurban-Vajanský. During the 'sixties the Slovaks founded three gymnasia and a *Matica*, or literary, linguistic and educational society, such as has been the centre of revival for the national life of other Slavonic nations. These were all closed and their property confiscated by the Magyars in the early 'seventies, but the struggle continues, and national self-consciousness is too strong for the attempts at Magyarization to have much probability of success.

Bibliography.—R. W. Seton-Watson, *Racial Problems in Hungary: a History of the Slovaks* (1909), gives all that can be required, with special chapters on Popular Art, Poetry and Music by D. Jurkovič the architect, S. Hurban-Vajanský and M. Lichard the composer. See also T. Čapek, *The Slovaks* (New York, 1906); Dr E. (E. H. M.)

SLOVENES [*Slovenci*, Ger. *Winden*, to be distinguished from the Slovaks (*q.v.*) and from the Slovinci (see Kashubes) west of Danzig], a Slavonic people numbering about 1,300,000. The chief mass of them lives in Austria, occupying Carniola (Krajina, Krain), the southern half of Carinthia (Chorutania, Koroško, Kärnten) and Styria (Stajersko, Steiermark) and some of the northern part of Istria; a small division of them is found over the Italian border in the vale of Resia; others in the extreme south-west of Hungary. Their neighbours on the south-west are Italians, on the west and north Germans: history and place-names point to Slovenes having formerly held parts of Tirol, Salzburg and Austria Proper; and on the east they have given up south-west Hungary to the Magyars; to the south they have the kindred race of the Croats. The boundary on this side is difficult to fix, as the transition is gradual and a certain dialect of Croatian (marked by the use of *kaj* = "what") is by some considered to have been originally Slovene (see Croatia-Slavonia). Even within the limits above defined the Slovenes are much mixed with Germans, especially in the towns; only in Carniola are they fairly solid. Here they call themselves Krajinci rather than Slovenes, in fact everywhere the general term gives place to local names, because the race is so much split up geographically, dialectically and politically that consciousness of unity is of rather recent growth. The main intellectual centre has been Laibach (Ljubljana) and next to it Klagenfurt (Celovec); in Graz (Gradec) the German element, and in Görz (Gorica) the Italian, predominates.

The Slovenes arrived in these parts in the 7th century, apparently pressed westwards by the Avars. By A.D. 595 they were already at war with the Bavarians, later they formed part of Samo's great Slavonic empire and were not quite out of touch with other Slavs. On its collapse they fell under the yoke of the Bavarians and Franks. At first they had their own princes, but in time these gave place to German dukes and margraves, who had, however, to use the native tongue on certain occasions. These fiefs of the empire finally fell to the Habsburgs and never gave them any trouble, hence their language has had freer play than that of most of the Austrian Slavs: they have been allowed to use it in primary and secondary schools and to some extent in local administration. The Slovenes were very early (beginning with the 8th century) Christianized by Italian and German missionaries; to them we owe the Freisingen fragments, confessions and part of a sermon, the earliest monuments, not merely of Slovene but of any Slavonic. The MS. dates from *c.* 1000, but the composition is older. The language is not pure Slovene, but seems to be an adaptation of an Old Slavonic translation. Yet it is enough to show that Old Slavonic is not Old Slovene. Kocel, a prince on the Platten See, to whom Cyril and Methodius (see Slavs) preached on their way to Rome, was probably a Slovene, but no traces of their work survive in this quarter. Except for a few 15th-century prayers and formulae we do not find any more specimens of Slovene until the Reformation, when Primus Truber translated a catechism, the New Testament and other works (Tübingen, 1550–1582), and J. Dalmatin issued a splendid Bible (Wittemberg, 1584), with an interesting vocabulary to make his work intelligible to any Slovene or Croat: at the same time and place A. Bohorizh (*zh* = *č*) issued a good grammar (*Arcticae Horulae*, &c.). To counteract this the Roman Catholics translated the work of their English apologist Stapleton, but their final policy was to burn all the Slovene books they could find, so that these are extremely rare. The policy was successful and only about 15% of the

Slovenes are Protestants. Slovene woke to a new life in the latter part of the 18th century. Valentin Vodnik was the first poet (see *Arch. f. Slav. Phil.* (1901), xxiii. 386, xxiv. 74), but his successor France Prešeren (1800–1849) appears to have been really great, worthy of a larger circle of readers. Other poets have been A. Janežič, S. Gregorčič and Murn-Aleksandrov; Erjavec was a story-teller, Jurčič a novelist, but as usual with these beginnings of literature the same man may make a grammar, issue an almanack, and try all kinds of poetry. The two great Slavists Kopitar and Miklosich were Slovenes, but were led astray by race feeling to insist upon Old Slavonic being Old Slovene. They were succeeded by G. Krek and V. Oblak.

The chief centres of Slovene letters are the *Matica* or Linguistic and Literary Society and the Lyceum at Laibach. The *Matica* publishes a chronicle (*Letopis*) and there are many periodicals, chief of which are the *Ljubljansky Zvon* and *Kres*, the latter published at Klagenfurt. The liberal and clerical organs carry on a lively polemic.

The Slovene language is the most westerly of the South Slavonic group. It is very closely allied to Serbo-Croatian, but shows some points of resemblance to Čech (retaining *dl* and *tl*, loss of aorist, &c). It is split into eight dialects which differ among themselves widely. The people of Resia are sometimes classed quite apart. In phonetics Slovene is remarkable for the change of the original *tj dj* into *č* and *j* (our y) respectively, of *ę* into *u*, and for the coincidence of the old half vowels *ĭ* and *ŭ* in a dull *e*. In morphology it has retained the dual of both nouns and verbs more perfectly than any other living language, also the supine and several periphrastic tenses: it has lost its aorist and imperfect, and its participles have mostly been fixed as so-called gerunds or verbal adverbs. The language has suffered much from Germanisms and even developed an article which has since been purified away. There is a free accent and the accented syllables may be long or short. The Resia dialect has preserved the Proto-Slavonic accent very exactly. The Slovenes have always used the Latin alphabet more or less clumsily: recently the orthography has been reformed after the manner of Čech, but uniformity has not yet been reached.

SLUM, a squalid, dirty street or quarter in a city, town or village, inhabited by the very poor, destitute or criminal classes; over-crowding is frequently another characteristic (see HOUSING). The word is a comparatively recent one and is of uncertain origin. It has been doubtfully connected with a dialectal use of "slump" in the sense of a marshy, swampy place; cf. Ger. *Schlamm*, mud, and Eng. dialect *slammock*, slattern (Skeat, *Etym. Dict.*, 1910).

SLUYS, BATTLE OF, fought on Saturday the 24th of June 1330, one of the two sea-fights in which King Edward III. of England commanded in person, the other being that called Espagnols-sur-Mer (*q.v.*). The place of the encounter was in front of the town of Sluis, Sluys, or in French Écluse, on the inlet between West Flanders and Zeeland. In the middle of the 14th century this was an open roadstead capable of holding large fleets. It has now been silted up by the river Eede. A French fleet, which the king, in a letter to his son Edward the Black Prince, puts at 190 sail, had been collected in preparation for an invasion of England. It was under the command of Hue Quiéret, admiral for the king of France, and of Nicholas Béhuchet, who had been one of the king's treasurers, and was probably a lawyer. Part of the fleet consisted of Genoese galleys serving as mercenaries under the command of Barbavera. Although English historians speak of King Edward's fleet as inferior in number to the French, it is certain that he sailed from Orwell on the 22nd of June with 200 sail, and that he was joined on the coast of Flanders by his admiral for the North Sea, Sir Robert Morley, with 50 others. Some of this swarm of vessels were no doubt mere transports, for the king brought with him the household of his queen, Philippa of Hainault, who was then at Bruges. As, however, one of the queen's ladies was killed in the battle, it would appear that all the English vessels were employed. Edward anchored at Blankenberghe on the afternoon of the 23rd and sent three squires to reconnoitre the position of the French. The Genoese Barbavera advised his colleagues to go to sea, but Béhuchet, who as constable exercised the general command, refused to leave the anchorage. He probably wished to occupy it in order to bar the king's road to Bruges. The disposition of the French was made in accordance with the usual medieval tactics of a fleet fighting on the defensive. Quiéret and Béhuchet formed their force into three or four lines, with the ships tied to one another, and with a few of the largest stationed in front as outposts. King Edward entered the roadstead on the morning of the 24th, and after manœuvring to place his ships to windward, and to bring the sun behind him, attacked. In his letter to his son he says that the enemy made a noble defence "all that day and the night after." His ships were arranged in two lines, and it may be presumed that the first attacked in front, while the second would be able to turn the flanks of the opponent. The battle was a long succession of hand-to-hand conflicts to board or to repel boarders. King Edward makes no mention of any actual help given him by his Flemish allies, though he says they were willing, but the French say that they joined after dark. They also assert that the king was wounded by Béhuchet, but this is not certain, and there is no testimony save a legendary one for a personal encounter between him and the French commander, though it would not be improbable. The battle ended with the almost total destruction of the French. Quiéret was slain, and Béhuchet is said to have been hanged by King Edward's orders. Barbavera escaped to sea with his squadron on the morning of the 25th, carrying off two English prizes. English chroniclers claim that the victory was won with small cost of life, and that the loss of the French was 30,000 men. But no reliance can be placed on medieval estimates of numbers. After the battle King Edward remained at anchor several days, and it is probable that his fleet had suffered heavily.

AUTHORITIES.—The story of the battle of Sluys is told from the English side by Sir Harris Nicolas, in his *History of the Royal Navy*, vol. ii. (London, 1847); and from the French side by M. C. de la Roncière, *Histoire de la marine française*, vol. i. (Paris, 1899). Both make copious references to original sources. (D. H.)

SLYPE, a variant of "slip" in the sense of a narrow passage; in architecture, the name for the covered passage usually found in monasteries between the transept and the chapter-house, as at Winchester, Gloucester, Exeter and St Albans.

SMACK, a general term for a small decked or half-decked vessel, sailing under various rigs and used principally for fishing. The word, like so many sea terms, was borrowed from the Dutch, where *smak*, earlier *smacke*, is the name of a coasting vessel; it is generally taken as a corruption of *snack*, cf. Swed. *snäcka*, Dan. *snackke*, a small sailing-vessel, and is to be referred to the root seen in "snake," "snail," the original meaning a gliding, creeping thing. "Smack," taste, and "smack," a smart sounding blow or slap, also used of the sound of the lips in kissing or tasting, must be distinguished. In the first case the word is in O.E. *smaec* and is common to Teutonic languages, cf. Dan. *smag*, Ger. *schmecken*, &c.; the second word is onomatopoeic, cf. "smash," and is also found in other Teutonic languages. It is not connected with the word meaning "taste," though no doubt confused owing to the sense of smacking the lips.

SMALL ISLES, a parish of islands of the Inner Hebrides, Inverness-shire, Scotland. It consists of the islands of Canna, Sanday, Rum, Eigg and Muck, lying, in the order named, like a crescent with a trend from N.W. to S.E., Canna being the most northerly and Muck the most southerly. They are separated from Skye by Cuillin Sound and from the mainland by the Sound of Ardnamurchan. The surface is moorland, pasture and mountain. They are rich in sea-fowl, the most common being the eider duck, puffin, Manx shearwater, black guillemot, kittiwake and herring gull. The fisheries include cod, ling and herring. The rainfall amounts to 56 in. for the year, and the temperature is fairly high, the mean for the year being 47° 5′ F. Steamers call at Eigg at regular intervals and less often at Rum and Canna. Canna (pop. 49), an island of basaltic rock, is situated about 10 m. from the nearest point of Skye, and measures 4½ m. from E. to W. and 1¼ m. from N. to S. Potatoes, barley and a little oats are grown, and the pasture being good the cattle are larger than most of the Hebridean breeds. The harbour is screened from south-westerly gales by the isle of Sanday. The antiquarian remains include a weather-worn sculptured stone cross and the ruins of a chapel of St Columba. Compass Hill (450 ft.) on the E. is so named from the alleged disturbance of the compasses of vessels passing within its sphere of influence. Sanday (pop. 44), another basaltic island, lies close to the S.E. of Canna. It measures 1¾ m. from E. to W. and 3¼ m. from N. to S. Some 3¾ m. S.E. of Canna is the island of Rum (pop. 149), which is situated 8½ m. from the nearest point of Skye, and measures 8½ m. N. to S. and 8 m. from E. to W. Geologically, its northern half is composed of Torridonian sandstone, with basalt at points between the West coast and the centre, of gabbro in the south-east, with a belt of gneissose rocks on its east seaboard and of quartz-porphyry in the south-west. It is mountainous in the south. Among the higher peaks are Askival (2659 ft.), Ashval (2552), Sgor-nan-Gillean (2503) and Allival (2368). On the north-west shore is a cliff where bloodstones are quarried. The mountains are a haunt of red deer. The harbour of the village of Kinloch, at the head of Loch Scresort, is resorted to during gales from the N.W. and S. Fully 4 m. S.E. and 7½ m. from the nearest point of the mainland lies the island of Eigg, or Egg (pop. 211), measuring from N. to S. 5 m. and from E. to W. 3½ m. It is in the main basaltic, but a band of quartz-porphyry runs from the centre in a north-westerly direction to the coast, and there is some oolitic rock on the north shores. On the north-east coast is a cave with a narrow mouth, opening into a hollow 255 ft. long. In it Macleod of Skye, towards the end of the 16th century, ordered 200 Macdonalds, inhabitants of the isle—men, women and children—to be suffocated, their bones being found long afterwards. The people are chiefly engaged in fisheries and cattle-rearing. Three m. S.W. is the island of Muck (pop. 42), which is about 1⅓ m. long by 2⅔ m. broad and lies fully 5 m. from the nearest point of Ardnamurchan. It is almost wholly basaltic, but has some oolite at the head of the bay on its north side.

SMALLPOX, or VARIOLA (*varus*, "a pimple"), an acute infectious disease characterized by fever and by the appearance on the surface of the body of an eruption, which, after passing through various stages, dries up, leaving more or less distinct cicatrices. (For pathology see PARASITIC DISEASES.) Few diseases have been so destructive to human life as smallpox, and it has ever been regarded with horror alike from its fatality, its loathsome accompaniments and disfiguring effects, and from the fact that no age and condition of life are exempt from liability to its occurrence. Although in most civilized countries its ravages have been greatly limited by the protection afforded by vaccination, yet epidemic outbreaks are far from uncommon, affecting especially those who are unprotected, or whose protection has become weakened by lapse of time.

Much obscurity surrounds the early history of smallpox. It appears to have been imported into Europe from Asia, where it had been known and recognized from remote antiquity. The earliest accounts of its existence reach back to the middle and end of the 6th century, when it was described by Procopius and Gregory of Tours as occurring in epidemic form in Arabia, Egypt and the south of Europe. In one of the narratives of the expedition of the Abyssinians against Mecca (*c.* 550) the usual miraculous details are combined with a notice of smallpox breaking out among the invaders.[1] Not a few authorities, however, regard these accounts as referring not to smallpox, but to plague. The most trustworthy statements as to the early existence of the disease are found in an account by the 9th-century Arabian physician Rhazes, by whom its symptoms were clearly described, its pathology explained by a humoral or fermentation theory, and directions given for its treatment. During the period of the Crusades smallpox appears to have spread extensively through Europe, and hospitals for its treatment were erected in many countries. But at this period and for centuries afterwards the references to the subject include in all likelihood other diseases, no precise distinction being made between the different forms of eruptive fever. Smallpox was known in England as early as the 13th century, and had probably existed there before. It appears to have been introduced into America by the Spaniards in the early 16th century, and there, as in Europe and throughout the known world, epidemics were of frequent occurrence during succeeding centuries.

The only known factor in the origin of smallpox is contagion—this malady being probably the most contagious of all diseases. Its outbreak in epidemic form in a locality may frequently be traced to the introduction of a single case from a distance. The most direct means of communicating smallpox is inoculation. By far the most common cause of conveyance of the disease, however, is contact with the persons or the immediate surroundings of those already affected. The atmosphere around a smallpox patient is charged with the products of the disease, which likewise cling to clothing, furniture &c. The disease is probably communicable from its earliest manifestations onwards to its close, but it is generally held that the most infectious period extends from the appearance of the eruption till the drying up of the pustules. Smallpox may also readily be communicated by the bodies of those who have died from its effects. No age is exempt from susceptibility to smallpox. Infants are occasionally born with the eruption or its marks upon their bodies, proving that they had undergone the disease *in utero*. Dark-skinned races are said to suffer more readily and severely than whites. One attack of smallpox as a rule confers immunity from any recurrence, but there are numerous exceptions to this rule. Overcrowding and all insanitary surroundings favour the spread of smallpox where it has broken out; but the most influential condition of all is the amount of protection afforded to a community by previous attacks and by vaccination (*q.v.*). Such protection, although for a time most effectual, tends to become exhausted unless renewed. Hence in a large population there is always likely to be an increasing number of individuals who have become susceptible to smallpox. This probably explains its occasional and even apparently periodic epidemic outbreaks in large centres, and the well-known fact that the most severe cases occur at the beginning—those least protected being necessarily more liable to be first and most seriously attacked.

Symptoms.—While the symptoms of smallpox are essentially the same in character in all cases, they are variously modified according to the form which the disease may assume, there being certain well-marked varieties of this as of most other infectious maladies. The following description applies to an average case. After the reception into the system of the smallpox contagion the onset of the symptoms is preceded by a period of incubation, during which the patient may or may not complain. This period is believed to be from about ten to fourteen days. In cases of direct inoculation of the virus it is considerably shorter. The invasion of the symptoms is sudden and severe, in the form of a rigor followed by fever (the *primary fever*), in which the temperature rises to 103° or 104° Fahr. or higher, notwithstanding that perspiration may be going on. A quick pulse is present, together with thirst and constipation, while intense headache accompanied with vomiting and pain in the back is among the most characteristic of the initial symptoms. Occasionally the disease is ushered in by convulsions. These symptoms continue with greater or less intensity throughout two entire days, and during their course there may occasionally be noticed on various parts of the body, especially on the lower part of the abdomen and inner sides of the thighs, a diffuse redness accompanied by

[1] See Nöldeke, *Geschichte der Perser . . . aus Tabari* (Leiden, 1879), p. 218. Nöldeke thinks that this notice may be taken from genuine historical tradition, and seems to find an allusion to it in an old poem.

slight spots of extravasation (*petechiae*), the appearance somewhat resembling that of scarlet fever. These " prodromal rashes," as they are termed, appear to be more frequent in some epidemics than in others, and they do not seem to have any special significance. They are probably more frequently seen in cases of the mildest form of smallpox (formerly termed varioloid), referred to below as modified smallpox. On the third day the characteristic eruption begins to make its appearance. It is almost always first seen on the face, particularly about the forehead and roots of the hair, in the form of a general redness; but upon this surface there may be felt by the finger numerous elevated points more or less thickly set together. The eruption, which is accompanied by heat and itching, spreads over the face, trunk and extremities in the course of a few hours—continuing, however, to come out more abundantly for one or two days. It is always most marked on the exposed parts; but in such a case as that now described the individual " pocks " are separated from each other (discrete). On the second or third day after its appearance the eruption undergoes a change—the pocks becoming vesicles filled with a clear fluid. These vesicles attain to about the size of a pea, and in their centre there is a slight depression, giving the characteristic umbilicated appearance to the pock. The clear contents of these vesicles gradually become turbid, and by the eighth or ninth day they are changed into pustules containing yellow matter, while at the same time they increase still further in size and lose the central depression. Accompanying this change there are great surrounding inflammation and swelling of the skin, which, where the eruption is thickly set, produce much disfigurement and render the features unrecognizable, while the affected parts emit an offensive odour, particularly if, as often happens, the pustules break. The eruption is present not only on the skin, but on mucous membranes, that of the mouth and throat being affected at an early period; and the swelling produced here is not only a source of great discomfort, but even of danger, from the obstruction thus occasioned in the upper portion of the air-passages. The voice is hoarse and a copious flow of saliva comes from the mouth. The mucous membrane of the nostrils is similarly affected, while that of the eyes may also be involved, to the danger of permanent impairment of sight. The febrile symptoms which ushered in the disease undergo marked abatement on the appearance of the eruption on the third day, but on the eighth or ninth, when the vesicles become converted into pustules, there is a return of the fever (*secondary* or *suppurative fever*), often to a severe extent, and not infrequently accompanied by prominent nervous phenomena, such as great restlessness, delirium or coma. On the eleventh or twelfth day the pustules show signs of drying up (desiccation), and along with this the febrile symptoms decline. Great itching of the skin attends this stage. The scabs produced by the dried pustules gradually fall off and a reddish brown spot remains, which, according to the depth of skin involved in the disease, leaves a permanent white depressed scar—this " pitting " so characteristic of smallpox being specially marked on the face. Convalescence in this form of the disease is as a rule uninterrupted.

Varieties.—There are certain varieties of smallpox depending upon the form it assumes or the intensity of the symptoms. *Confluent smallpox* (*variola confluens*), while essentially the same in its general characters as the form already described, differs from it in the much greater severity of all the symptoms even from the onset, and particularly in regard to the eruption, which, instead of showing itself in isolated pocks, appears in large patches run together, giving a blistered aspect to the affected skin. This confluent condition is almost entirely confined to the face, and produces shocking disfigurement, while subsequently deep scars remain and the hair may be lost. The mucous membranes suffer in a similar degree of severity, and dangerous complications may arise from the presence of the disease in the mouth, throat and eyes. Both the primary and secondary fevers are extremely severe. The mortality is very high, and it is generally estimated that at least 50% of such cases prove fatal, either from the violence of the disease or from one or other of the numerous complications which are specially apt to attend upon it. Convalescence is apt to be slow and interrupted. Another variety is that in which the eruption assumes the *haemorrhagic* form owing to bleeding taking place into the pocks after their formation. This is apt to be accompanied with haemorrhages from various mucous surfaccs (particularly in the case of females), occasionally to a dangerous degree and with symptoms of great prostration. Many of such cases prove fatal. A still more serious form is that termed *malignant, toxic or purpuric smallpox*, in which there is intense streptococcus septicaemia, and the patient is from the onset overwhelmed with the poison and quickly succumbs—the rash scarcely, if at all, appearing or showing the haemorrhagic or purpuric character. Such cases are, however, comparatively rare. The term *modified smallpox* is applied to cases occurring in persons constitutionally but little susceptible to the disease, or in whom the protective influence of vaccination or a previous attack of smallpox still to some extent exists. Cases of this mild kind are of very common occurrence where vaccination has been systematically carried out. As compared with an average casc of the unmodified disease as above described this form is very marked, the differences extending to all the phenomena of the disease. (1) As regards its onset, the initial fever is much milder and the premonitory symptoms altogether less in severity. (2) As regards the eruption, the number of pocks is smaller, often only a few and mostly upon the body. They not infrequently abort before reaching the stage of suppuration: but should they proceed to this stage the secondary fever is extremely slight or even absent. There is little or no pitting. (3) As regards complications and injurious results, these are rarely seen and the risk to life is insignificant.

Various circumstances affect the mortality in ordinary smallpox and increase the dangers attendant upon it. The character of the epidemic has an important influence. In some outbreaks the type of the disease is much more severe than in others, and the mortality consequently greater.

In 1901 and 1903 there were epidemics in the United States in which it was only 2%. The mortality in the Philadelphia epidemic is given by Welch and Schamberg as 26·89% in 7204 cases, while in the Glasgow epidemic of 1900–1901, it reached 51·6% in the unvaccinated and 10·4% in the vaccinated. Below are some particulars of the annual death rate.

Smallpox Death Rate, England and Wales.

Years.	Number of Deaths from Smallpox.*	Deaths from Smallpox to every Million living.
1902	2464	75
1903	760	23
1904	507	15
1905	116	4
1906	21	0·6
1907	10	0·3
1908	12	0·3

*Deaths entered as being from chicken-pox are not included, though many are probably due to the graver disease.

Smallpox is most fatal at the extremes of life, except in the case of vaccinated infants, in whom there is immunity from the disease. Again, any ordinary case with discrete eruption is serious, and a case of confluent or even semi-confluent character is much more grave, while the haemorrhagic variety is frequently, and the toxic always, fatal. Numerous and often dangerous complications, although liable to arise in all cases, are more apt to occur in the severer forms, and in general at or after the supervention of the secondary fever. The most important are inflammatory affections of the respiratory organs, such as bronchitis, pleurisy or pneumonia, diphtheritic conditions of the throat, and swelling of the mucous membrane of the larynx and trachea. Destructive ulceration affecting the eyes or ears is a well-known and formidable danger, while various affections of the skin, in the form of erysipelas, abscess or carbuncles, are of not infrequent occurrence.

The prophylaxis of smallpox depends on successful vaccination and re-vaccination (see VACCINATION), together with the establishment of smallpox hospitals for the treatment of the disease when it has broken out, to which the patient should be at once removed, and those who have been in contact with the patient should be promptly re-vaccinated. The efficiency of the protection given by vaccination and systematic re-vaccination is demonstrated by the almost entire suppression of the disease in Germany (see Dr Bruce Low's *Report to the Local Government Board*, 1903–1904). Mrs Garrett Anderson, writing to *The Times* in September 1903, showed the enormous expense laid on the rates in England for the maintenance of smallpox hospitals in order to counteract inefficient vaccination. London with a population of 6½ millions reserves 2500 beds in a hospital removed from the city; Berlin with a population of 2 millions reserves 12 beds in the pavilion of a general hospital; Dresden with a population of 500,000 reserves 20 beds in the Friedrichstadt Hospital, but no case was admitted for 10 years previous to the Report. In Stuttgart (population 200,000) a hut of six beds is set aside for smallpox, but it has fallen into bad repair from disuse. Smallpox cases in Germany are usually sporadic cases introduced by foreigners. Where persons have been exposed to the infection of smallpox, if immediate vaccination fails to protect them from the disease, it has been shown to considerably modify the type. The plan of identification and surveillance of all contact cases has given good results. In the Bristol epidemic of 1908 there were 35 cases and 9 deaths. The contacts numbered 1354, and 16,398 visits of inspection were paid.

Prophylaxis and treatment.

The patient should lie on a soft bed in a well-ventilated but somewhat darkened room and be fed with the lighter forms of nutriment, such as milk, soups, &c. The skin should be sponged occasionally with tepid water, and the mouth and throat washed with an antiseptic solution. In a severe case, with evidence of much prostration, stimulants may be advantageously employed. The patient should be always carefully watched, and special vigilance is called for where delirium exists. This symptom may sometimes be lessened by sedatives, such as opium, bromides or chloral. With the view of preventing pitting many applications have been proposed, but probably the best are cold or tepid compresses of light weight kept constantly applied over the face and eyes. The water out of which these are wrung may be a weak solution of carbolic or boracic acid. When the pustules have dried up the itching this produces may be much relieved by the application of oil or vaseline.

What is known as the *red light treatment*, in which the actinic or chemical rays are excluded, has been advocated by Prof. Niels Finsen of Copenhagen and others. He considers it valuable only in that it protects the pustule from the deleterious effects of light, and he and other observers claim that if resorted to early it abolishes suppuration in the pustules, lessens scarring and shortens the course of the disease. Medical opinion in England is divided as to its merit. Herbert Peck of Chesterfield, in 244 cases so treated in 1902–1905, had only 6 deaths, a mortality of 2·4%, while the case mortality during the same period was, Lancashire 5·8%, Derbyshire 6%, Cheshire 6·4%, Liverpool 2·7% and Manchester 5·6% in cases treated without red light. An interesting fact in connection with the treatment is its great antiquity in China and Japan, while in England in the middle ages smallpox patients wore red garments and lay in beds where the light filtered through red curtains.

Complications are to be dealt with as they arise, and the severer forms of the disease treated in reference to the special symptoms presented. In cases where the eruption is tardy of appearing and the attack threatens to assume the toxic form, marked benefit attends the use of the wet pack. Disinfectants should be abundantly employed in the room and its vicinity, and all clothing, &c., in contact with the patient should be exposed to the vapour of formalin. Béclère, Thomson and Brownlee have advocated the use of the serum of immunized heifers. The dose, however, requires to be very large, being equivalent to one-fiftieth part of the body weight in adults and one-twentieth part in children.

Inoculation.—Previously to the introduction of vaccination (*q.v.*) the method of preventive treatment by what was known as inoculation had been employed. This consisted in introducing into the system—in a similar way to the method now commonly employed in vaccination—the smallpox virus from a mild case with the view of reproducing the disease also in a mild form in the person inoculated, and thus affording him protection from further attack. This plan had apparently been resorted to by Eastern nations from an early period in the history of the disease. During the latter part of the Ming dynasty there was introduced into China a system of inoculation in which the method was to blow the pulverized germ-laden crusts from a small-pox pustule through a silver tube into the nostril, the left being chosen in a male, the right in a female. Inoculation was known to be extensively practised in Turkey in the beginning of the 18th century, when, chiefly through the letters of Lady Mary Wortley Montagu, it became known and was speedily adopted in England. There is no doubt, both from the statistics of the Smallpox and Inoculation Hospital, London, and from the testimony of physicians throughout the country, that this practice made a marked impression upon the fatality of the disease, and was itself attended with extremely little risk to life. The objections to it, however, were great, for, although usually conveying the smallpox in a mild form, it not infrequently took effect severely, and, while death might be averted, the disfiguring results of the disease remained. Further, each inoculated person upon whom the operation took effect became for the time being a possible source of infection to others, and in point of fact the practice tended to spread the disease and so to increase the general mortality. Although inoculation continued to be practised for a number of years subsequently to Jenner's great discovery, it gradually became displaced by vaccination, and in 1840 an Act of Parliament was passed rendering smallpox inoculation unlawful in England.

SMALRIDGE, GEORGE (1663–1719), English bishop, was born at Lichfield, where he received his early education, this being completed at Westminster school and at Christ Church, Oxford. His political opinions were largely modelled on those of his friend Francis Atterbury, with whom he was associated at Oxford and elsewhere. After being a tutor at Christ Church, he was minister of two chapels in London, and for six or seven years he acted as deputy for the regius professor of divinity at Oxford; his Jacobite opinions, however, prevented him from securing this position when it fell vacant in 1707. In 1711 he was made dean of Carlisle and canon of Christ Church, and in 1713 he succeeded Atterbury as dean of Christ Church. In the following year he was appointed bishop of Bristol, but retained his deanery. In 1715 Smalridge refused to sign the declaration against the pretender, James Edward, defending his action in his *Reasons for not signing the Declaration*. In other ways also he showed animus against the house of Hanover, but his only punishment was his removal from the post of lord almoner to the king. He died on the 27th of September 1719. The bishop was esteemed by Swift, Steele, Whiston and other famous men of his day, while Dr Johnson declared his sermons to be of the highest class. His *Sixty Sermons, preached on Several Occasions*, was published in 1726; other editions 1827, 1832, 1853 and 1862.

SMALTITE, a mineral consisting of cobalt diarsenide ($CoAs_2$). It crystallizes in the cubic system with the same hemihedral symmetry as pyrites; crystals have usually the form of cubes or cubo-octahedra, but are imperfectly developed and of somewhat rare occurrence. More often the mineral is found as compact or granular masses. The colour is tin-white to steel-grey, with a metallic lustre; the streak is greyish black. Hardness 5½; specific gravity 6·5. The cobalt is partly replaced by iron and nickel, and as the latter increases in amount there is a passage to the isomorphous species chloanthite ($NiAs_2$). It occurs in veins with ores of cobalt, nickel, copper and silver: the best known locality is Schneeberg in Saxony. The name smaltite was given by F. S. Beudant, in 1832, because the mineral was used in the preparation of smalt for producing a blue colour in porcelain and glass. (L. J. S.)

SMART, CHRISTOPHER (1722–1771), English poet, son of Peter Smart, of an old north country family, was born at Shipbourne, Kent, on the 11th of April 1722. His father was steward for the Kentish estates of William, Viscount Vane, younger son of Lord Barnard of Raby Castle, Durham. Christopher Smart received his first schooling at Maidstone, and then at the grammar school of Durham. He spent part of his vacations at Raby Castle, and his gifts as a poet gained him the patronage of the Vane family. Henrietta, duchess of Cleveland, allowed him a pension of £40 which was paid until her death in 1742. Thomas Gray, writing to his friend Thomas Wharton in 1747, warned him to keep silence about Smart's delinquencies lest they should come to the ears of Henry Vane (afterwards earl of Darlington), and endanger his allowance. At Cambridge, where he was entered at Pembroke College in 1739, he spent much of his time in taverns, and got badly into debt, but in spite of his irregularities he became fellow of his college, praelector in philosophy and keeper of the common chest in 1745. In November 1747 he was compelled to remain in his rooms for fear of his creditors. At Cambridge he won the Seaton prize for a poem on "one of the attributes of the Supreme Being" in 1750 (he won the same prize in 1751, 1752, 1753 and 1755); and a farce entitled *A Trip to Cambridge, or The Grateful Fair*, acted in 1747 by the students of Pembroke, was from his pen. In 1750 he contributed to *The Student, or The Oxford and Cambridge Monthly Miscellany.* During one of his visits to London he had made the acquaintance of John Newbery, the publisher, whose step-daughter, Anna Maria Carman, he married, with the result of forfeiting his fellowship in 1753. About 1752 he permanently left Cambridge for London, though he kept his name on the college books, as he had to do in order to compete for the Seaton prize. He wrote in London under the pseudonym of "Mary Midnight" and "Pentweazle." He had edited *The Midwife, or the Old Woman's Magazine* (1751–1753), and had a hand in many other "Grub Street" productions. Some criticisms made by "Sir" John Hill (1716?–1775) on his *Poems on Several Occasions* (1752) provoked his satire of the *Hilliad* (1753), noteworthy as providing the model for the *Rolliad*. In 1756 he finished a prose translation of Horace, which was widely used, but brought him little profit. He agreed in the same year to produce a weekly paper entitled *The Universal Visitor*, for which Samuel Johnson wrote some numbers. In 1751 Smart had shown symptoms of mental aberration, which developed into religious mania, and between 1756 and 1758 he was in an asylum. Dr Johnson visited him and thought that he ought to have been at large. During his confinement he conceived the idea of the single poem that has made him famous, "A Song to David," though the story that it was indented with a key on the panels of his cell, and shaded in with charcoal, may be received with caution. It shows no trace of morbid origin. After his release Smart produced other religious poems, but none of them shows the same inspiration. His wife and children had gone to live with friends as he was unable to support them, and for some time before his death, which took place on the 21st of May 1771, he lived in the rules of King's Bench, and was supported by small subscriptions raised by Dr Burney and other friends.

Of all that he wrote, "A Song to David" will alone bear the test of time. Unlike in its simple forceful treatment and impressive directness of expression, as has been said, to anything else in 18th-century poetry, the poem on analysis is found to depend for its unique effect also upon a certain ingenuity of construction, and the novel way in which David's ideal qualities are enlarged upon. This will be more readily understood on reference to the following verse, the first twelve words of which become in turn the key-notes, so to speak, of the twelve succeeding verses:—

> "Great, valiant, pious, good, and clean,
> Sublime, contemplative, serene,
> Strong, constant, pleasant, wise!
> Bright effluence of exceeding grace;
> Best man!—the swiftness, and the race,
> The peril, and the prize."

The last line is characteristic of another peculiarity in "A Song to David," the effective use of alliteration to complete the initial energy of the stanza in many instances. But in the poem throughout is revealed a poetic quality which eludes critical analysis.

From the *Poems of the late Christopher Smart* (1791) the "Song to David" (pr. 1763) was excluded as forming a proof of his mental aberration. It was reprinted in 1819, and has since received abundant praise. In an abridged form it is included in T. H. Ward's *English Poets*, vol. iii., and was reprinted in 1895, and in 1901 with an introduction by R. A. Streatfeild. Smart's other poems are included in Anderson's *British Poets*. Christopher Smart is one of Robert Browning's subjects in *The Parleyings with Certain People* (1887). See also the contributions to *Notes and Queries* of March 25th and May 6th, 1905, by the Rev. D. C. Tovey, who has read, and in some places revised, the above article.

SMART, SIR GEORGE THOMAS (1776–1867), English musician, was born in London, his father being a music-seller. He was a choir-boy at the Chapel Royal, and was educated in music, becoming an expert violinist, organist, teacher of singing and conductor; and in 1811 he was knighted by the lord-lieutenant of Ireland, having conducted a number of successful concerts in Dublin. Sir George Smart was, from that time onwards, one of the chief musical leaders and organizers in England, conducting at the Philharmonic, Covent Garden, the provincial festivals, &c., and in 1838 being appointed composer to the Chapel Royal. He was a master of the Handelian traditions, was personally acquainted with Beethoven and a close friend of Weber, who died in his house. His church music and glees include some well-known compositions. He died in London on the 23rd of February 1867. His brother Henry (1778–1823), father of the composer Henry Smart (*q.v.*), was also a prominent musician in his day.

SMART, HENRY (1813–1879), English organist and musical composer, born in London on the 26th of October 1813, was a nephew of Sir George Smart (*q.v.*). He studied first for the law, but soon gave this up for music. In 1831 he became organist of Blackburn parish church, where he wrote his first important work, a Reformation anthem; then of St Giles's, Cripplegate; St Luke's, Old Street; and finally of St Pancras, in 1864, which last post he held at the time of his death on the 6th of July 1879, less than a month after receiving a government pension of £100 per annum. Although Smart is now known chiefly by his compositions for the organ, which are numerous, effective and melodious, if not strikingly original, he wrote many vocal works, including some of the best specimens of modern part songs. His cantata, *The Bride of Dunkerron*, was written for the Birmingham festival of 1864; *Jacob* for Glasgow, in 1873; and his opera, *Bertha*, was produced with some success at the Haymarket in 1855. In the last fifteen years of his life Smart was practically blind.

SMART, JOHN (*c.* 1740–1811), English miniature painter, was born in Norfolk; he became a pupil of Cosway, and is frequently alluded to in his correspondence. This artist was director and vice-president of the Incorporated Society of Artists, and exhibited with that society. He went to India in 1788 and obtained a number of commissions in that country. He settled down in London in 1797 and there died. He married Edith Vere, and is believed to have had only one son, who died in Madras in 1809. He was a little man, of simple habits, and a member of the Society of Sandemanians. Many of his pencil drawings still exist in the possession of the descendants of a great friend of his only sister. Several of his miniatures are in Australia and belong to a cadet branch of the family. His work is entirely different to that of Cosway, quiet and grey in its colouring, with the flesh tints elaborated with much subtlety and modelled in exquisite fashion. He possessed a great knowledge of anatomy, and his portraits are drawn with greater anatomical accuracy and possess more distinction than those of any miniature painter of his time.

See *The History of Portrait Miniatures*, by G. C. Williamson, vol. ii. (London, 1904). (G. C. W.)

SMEATON, JOHN (1724–1792), English civil engineer, was born at Austhorpe Lodge, near Leeds, on the 8th of June 1724. He received a good education at the grammar school of Leeds. At an early age he showed a liking for the use of mechanical tools, and in his fourteenth or fifteenth year contrived to make a turning-lathe. On leaving school in his sixteenth year he was employed in the office of his father, an attorney, but, after attending for some months in 1742 the courts at Westminster Hall, he requested to be allowed to follow some mechanical profession. He became apprentice to a philosophical instrument maker, and in 1750 set up in business on his own account. Besides improving various mathematical instruments used in navigation and astronomy, he carried on experiments in regard to other mechanical appliances, amongst the most important being a series on which he founded a paper—for which he received the Copley medal of the Royal Society in 1759—entitled *An Experimental Inquiry concerning the Native Powers of Water and Wind to turn Mills and other Machines depending on a Circular Motion.* In 1754 he made a tour of the Low Countries to study the great canal works of foreign engineers. Already by his papers read before the Royal Society and his intercourse with scientific men his abilities as an engineer had become well known, and in 1756 application was made to him to reconstruct the Eddystone lighthouse, which had been burnt down in December of the previous year. After the completion of the new tower in 1759, Smeaton's advice was frequently sought in regard to important engineering projects, including the construction of canals (especially the Forth and Clyde canal), the drainage of fens, the designing of harbours and the repair and erection of bridges, though many of the schemes he drew up were not carried out on account of the general lack of capital. He was also employed in designing numerous waterwheels, windmills, pumps, and other mechanical appliances. A considerable portion of his time was devoted to astronomical studies and observations, on which he read various papers before the Royal Society. A year before his death he announced that he wished "to dedicate the chief part of his remaining time to the description of the several works performed under his direction," but he completed nothing more than the *Narrative of the Building of the Eddystone Lighthouse*, which had already appeared. He died at Austhorpe on the 28th of October 1792, and was buried in the old parish church of Whitkirk.

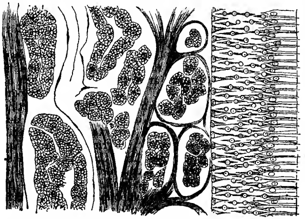
See John Holmes, *A Short Narrative of the Genius, Life and Works of the late Mr John Smeaton* (1793); and S. Smiles, *Lives of the Engineers.*

SMEDLEY, FRANCIS [FRANK] **EDWARD** (1818–1864), English novelist, was born at Great Marlow, Buckinghamshire, on the 4th of October 1818, a member of a Flintshire family. A cripple from his birth, he was educated privately, and contributed his first book, *Scenes from the Life of a Private Pupil*, anonymously to *Sharpe's London Magazine* in 1846–1848. His first essay proved so successful that it was expanded into *Frank Fairleigh*, and published in book-form in 1850. His next book *Lewis Arundel: or the Railroad of Life* was originally contributed to the same magazine, which he for some time edited, and was published in book-form in 1852. Of his other writings the best-known is *Harry Coverdale's Courtship* (1855). These are all capital stories, racily told. Either Hablot Knight Browne ("Phiz") or George Cruikshank supplied illustrations for most of his books. Smedley died in London on the 1st of May 1864.

SMEDLEY, WILLIAM THOMAS (1858–), American artist, was born in Chester county, Pennsylvania, of a Quaker family, on the 26th of March 1858. He worked on a newspaper, then studied engraving and art in Philadelphia, in the Pennsylvania Academy of the Fine Arts, and—after making a tour of the South Seas—in Paris under Jean Paul Laurens. He settled in New York City in 1880; in 1882 went with the Marquis of Lorne through Canada, preparing sketches for *Picturesque Canada*; and in 1905 became a member of the National Academy of Design. Most of his work was magazine and book illustration for stories of modern life, but he painted portraits and water colours, and received the Evans Prize of the American Water Color Society in 1890, and a bronze medal at the Paris Exposition of 1900.

SMELL (connected etymologically with "smoulder" and "smoke"), a sensation excited by the contact with the olfactory region (see OLFACTORY ORGAN, for anatomy) of certain substances, usually in a gaseous condition and necessarily in a state of fine subdivision. The sense is widely distributed throughout the animal kingdom. The lower animals, especially those breathing in water, become cognizant of the presence of odoriferous matter near them without touch, vision or hearing, and we suppose that they do so by some sense of taste or smell, or a combination of both. In such cases smell has been appropriately termed "taste at a distance," by which is meant that particles of matter may be diffused through the water so as to come into contact with the terminal organ, and give rise to a sensation such as would have been excited had the matter from which the particles emanated come directly into contact with the nerve-endings. It is therefore of no great importance whether such sensations in humble aquatic organisms are termed taste or smell. In the higher air-breathing animals, however, the senses are differentiated: that of taste is found at the entrance of the alimentary canal, whilst that of smell guards the opening of the respiratory tract This view assists in the interpretation of various structures met with in the lower forms which have been fairly regarded by naturalists as olfactory organs. It has not yet been decided whether the sense of smell depends, in the first instance, on a chemical or on a physical process. All that can be said is that sensory impulses are excited when odoriferous particles come into contact with the free ends of peculiar rod-like cells found in the olfactory mucous membrane. The free olfactory surface is always covered with a thin layer of fluid, and all odoriferous matters must be dissolved in this fluid so as to reach the rod-cells. There is here an analogy with the conditions found in the sense of taste, where sapid substances must be soluble in the fluid of the mouth. The intensity of the sensation of smell depends on the size of the area of the olfactory membrane affected. No satisfactory classification of odours can be given.

The interior of the nose (see OLFACTORY ORGAN and EPITHELIAL AND ENDOTHELIAL TISSUE) is divided physiologically into two portions—(1) the upper (*regio olfactoria*), which embraces the upper part of the septum, the upper turbinated



3 2 1

Longitudinal section through the olfactory membrane of guinea-pig. ×about 400. 1, Olfactory epithelium on free surface; 2, Plexus of olfactory nerve-fibres; 3, Pouches of serous glands containing epithelial cells.

bone, and a portion of the middle turbinated bone; and (2) the lower portion of the cavity (*regio respiratoria*). The olfactory region proper has a thicker mucous membrane than the respiratory; it is covered by a single layer of epithelial cells, often branched at their lower ends and containing a yellow or brownish red pigment; and it contains peculiar tubular glands named "Bowman's glands." The respiratory portion contains ordinary serous glands. In the olfactory region also are the terminal organs of smell. These are long narrow cells passing to the surface between the columnar epithelium covering the surface. The body of the cell is spindle-shaped and it sends up to the surface a delicate rod-like filament, whilst the deeper part is continuous with varicose nerve-filaments, the ends of the olfactory nerve.

Physical Causes of Smell.—Electrical or thermal stimuli do not usually give rise to olfactory sensations. J. Althaus states that electrical stimulation caused a sensation of the smell of phosphorus. To excite smell it is usually supposed that substances must be present in the atmosphere in a state of fine subdivision, or existing as vapours or gases. The fineness of the particles is remarkable, because if the air conveying an odour be filtered through a tube packed with cotton wool and inserted into the nose a smell is still discernible. This proceeding completely removes from the air micro-organisms less than the $\frac{1}{100000}$th of an inch in diameter. A grain or two of musk will scent an apartment for years and at the end of the time no appreciable loss of weight can be detected. Substances exciting smell are no doubt usually gases or vapours. Sir William Ramsay has endeavoured to connect the sense with the chemical constitution of the substance. The following gases have no smell:—hydrogen, oxygen, nitrogen, water gas, marsh gas, olefiant gas, carbon monoxide, hydrochloric acid, formic acid vapour, nitrous oxide and ammonia. (It is necessary, of course, to distinguish between the sensation of smell and the irritant action of such a gas as ammonia.) The gases exciting smell are chlorine, bromine, iodine, the compounds of the first two with oxygen and water, nitric peroxide, vapours of phosphorus and sulphur, arsenic, antimony, sulphurous acid, carbonic acid, almost all the volatile compounds of carbon except those already mentioned, some compounds of selenium and tellurium, the compounds of chlorine, bromine and iodine with the above-named elements, and some metals. Chlorine, bromine, iodine, sulphur, selenium and tellurium, which are volatile and give off vapour at ordinary temperatures, have each a characteristic smell. Ramsay points out that as a general rule substances having a low molecular weight have either no smell or simply cause irritation of the nostrils. He also shows that in the carbon compounds increase of specific gravity as a gas is associated to a certain point with a sensation of smell. Take the marsh gas or methane series commonly called the paraffins. The first two have no smell; ethane (fifteen times as heavy as hydrogen) has a faint smell; and it is not till butane (thirty times heavier than hydrogen) that a distinct sensation of smell is noticed. Again, a similar relation exists among the alcohols. Methyl alcohol has no smell. Ethyl, or ordinary alcohol free from ethers and water, has a faint smell; "and the odour rapidly becomes more marked as we rise in the series, till the limit of volatility is reached, and we arrive at solids with such a low vapour tension that they give off no appreciable amount of vapour at the ordinary temperature." Acids gain in odour with increase in density in the form of gas. Thus formic acid is devoid of smell; acetic acid has a characteristic smell; and the higher acids of the series—propionic, butyric, valerianic—increase in odour. It would appear also that "the character of a smell is a property of the element or group which enters into the body producing the smell, and tends to make it generic." Many compounds of chlorine, hydrogen, compounds of sulphur, selenium and tellurium, the paraffins, the alcohols, the acids, the nitrites, the amines, the pyridine series, the benzene group, have each a characteristic odour. To produce the sensation of smell a substance must have a molecular weight at least fifteen times that of hydrogen. For instance, the specific gravity of marsh gas is eight (no smell), of ethane fifteen (faint smell), of propane twenty-two (distinct smell). Again prussic acid has a specific gravity of fifteen, and many persons fail to detect its odour. There is a relation between the molecular weight of a gas and the presence or absence of odour. Gases of less than a certain molecular weight are odourless, and it is significant that to some persons hydrocyanic acid, which has a low molecular weight, gives rise to no sensation of smell. It has also been pointed out by J. B. Haycraft that chemical compounds of elements belonging to the same group, according to the well-known periodic law of Mendéleeff, have sometimes odours of a similar character (see article "Smell," Schäfer's *Physiology*, vol. ii. p. 1254). T. Graham pointed out that odorous substances are in general readily oxidized. J. Tyndall showed that many odorous vapours have a considerable power of absorbing heat. Taking the absorptive capacity of the air as unity, the following absorptions were observed in the respective cases:—

Name of Perfume.	Absorption per 100.	Name of Perfume.	Absorption per 100.
Patchouli	30	Lavender	60
Sandal-wood	32	Lemon	65
Geranium	33	Portugal	67
Oil of cloves	33·5	Thyme	68
Otto of roses	36·5	Rosemary	74
Bergamot	44	Oil of laurel	80
Neroli	47	Cassia	109

In comparison with the air introduced in the experiments the weight of the odours must be almost infinitely small. "Still we find that the least energetic in the list produces thirty times the effect of the air, whilst the most energetic produces 109 times the same effect." [1]

Venturi, B. Prévost and Liégeois have studied the well-known movements of odoriferous particles, such as camphor, succinic acid, &c., when placed on the surface of water, and they have suggested that all odoriferous substances in a state of fine subdivision may move in a similar way on the moist surface of the olfactory membrane, and thus mechanically irritate the nerve-endings. This explanation is too coarse; but it is well known that the odours of flowers are most distinctly perceived in the morning, or after a shower, when the atmosphere contains a considerable amount of aqueous vapour. It would appear also that the odours of animal effluvia are of a higher specific gravity than the air, and do not readily diffuse—a fact which may account for the pointer and bloodhound keeping their noses to the ground. Such smells are very persistent and are apparently difficult to remove from any surface to which they have become attached. The smell of a corpse may haunt a living person for days, notwithstanding copious ablutions and change of clothes.

Special Physiology of Smell.—It is necessary that the air containing the odour be driven forcibly against the membrane. Thus the nostrils may be filled with eau de Cologne in normal saline solution, or with air impregnated with sulphuretted hydrogen, and still no odour is experienced if the person does not breathe. When a sniff is made the air within the nasal passages is rarefied, and, as the air rushes in to equilibrate the pressure, it is forcibly propelled against the olfactory surface. When the air stream enters the nostrils, it passes vertically upwards, bends round and sweeps backwards and downwards at the level of the middle turbinated bones towards the posterior nares. There is a motion of the air over the olfactory surface. The olfactory surface must be moist; if it is dry, or is covered with too thick a layer of mucus (as in catarrh), the sense is much weakened or lost. The first moment of contact is the most acute and the sense quickly becomes blunted. The first scent of a flower is the strongest and sweetest; and after a few minutes' exposure the intensity of even a foetid odour may not be perceived. This fact may be accounted for on the supposition that the olfactory membrane becomes quickly coated with a thin layer of matter, and that the most intense effect is produced when the odoriferous substances are applied to a clean surface. The intensity of smell depends on (1) the area of olfactory surface affected, and (2) the degree of concentration of the odoriferous matter. It is said that musk to the amount of the two-millionth of a milligram, and one part of sulphuretted hydrogen in 1,000,000 parts of air, may be perceived. The smell of mercaptan has been experimentally detected when the dilution was 1 to 50,000,000,000, and it was calculated that the weight of mercaptan so detected in 50 cc. of air was 1/400,000,000 of a milligram (E. Fischer and Penzolalt). If the two nostrils are filled with different odorous substances, there is no mixture of the odours, but we smell sometimes the one and sometimes the other. Morphia, mixed with sugar and taken as snuff, paralyses the olfactory apparatus, while strychnine makes it more sensitive (Lichtenfels and Frölich). There is no evidence that there are in the olfactory region different end organs or olfactory cells for different odours. The sense, however, may be fatigued by one odour so that other odours are not experienced. Thus camphor may so fatigue the sense that ether and eau de Cologne cannot excite smell.

As a rule, we experience odours by the simultaneous use of both nostrils. Stimulation of either nostril would give rise to the sensation, while there is a fusion of sensations when both are affected. If, by means of a tube, an odour is conveyed into one nostril, while an odour of a different kind is directed into the other, there may be either a compound sensational effect, a sort of double-odour, or one odour may so predominate as entirely to destroy the other. The fusion of odours is not complete, and it is similar to the effect of combining, say blue and red, in stereoscopic vision. When one odour destroys the other, the obliteration must take place in the cerebral centre. Certain odours are antagonistic, such as musk and oil of bitter almonds, volatile oils and iodoform, ammonia and acetic acid. It is not unlikely that when one odour predominates among many, this may be due not to any chemical action of one substance over another, but that the missing sensations may be accounted for by their failure to excite the olfactory region of the cerebrum in the presence of a stronger stimulus.

The delicacy of the sense is much greater in many of the lower animals than in man, and it is highly probable that the dog or cat obtain information by means of this sense which a human being cannot get. Odours may excite in the minds of many animals vivid impressions, and they have probably a memory of smells which the human being does not possess. Even in man the sense may be greatly improved by exercising it. A boy, James Mitchell, was born

[1] Tyndall, *Contributions to Molecular Physics in Domain of Radiant Heat*, p. 99.

blind, deaf and dumb, and chiefly depended on smell for keeping up a connexion with the outer world. He readily observed the presence of a stranger in the room and he formed his opinions of persons apparently from their characteristic smells (see Dugald Stewart's *Works*, iv. 300). In some rare cases, the sense of smell is congenitally absent in human beings, and it may be much injured by the practice of snuffing or by diseases of the nose affecting the olfactory membrane. Subjective impressions of smells, like spectral illusions or sounds in the ears, are occasionally, but rarely, observed in cases of hysteria and in the insane. Excessive smoking injures the sense. Finally, it may be observed that the sense of odour gives information as to the characters of food and drink and as to the purity of the air. Some persons are sensitive to certain smells while they do not recognize others, such as hydrocyanic acid or mignonette. In the lower animals also, the sense is associated with the sexual functions. (J. G. M.)

SMELT (*Osmerus eperlanus*; Fr. *éperlan*; Scotch sparling or spirling), the common small European fish of the genus *Osmerus*, family *Salmonidae*. It breeds, unless land-locked, in salt or brackish water, and though it often enters rivers it does not ascend beyond tidal influence. Like other British Salmonids it spawns in winter. The true smelt inhabits the coasts of northern and central Europe, and allied species are known from the Atlantic and Pacific coasts of North America (*Osmerus mordax*, *O. thaleichthys*, *O. Japonicus*).

SMERDIS (Pers. *Bardiya*; by Ctesias, *Pers.* 8, called *Tanyoxarces*; by Xenophon, *Cyrop.* viii. 7. 11, who takes the name from Ctesias, *Tanaoxares*; by Justin i. 9, *Mergis*; in Aeschylus, *Pers.* 774, *Mardos*), a Persian king of infamous memory; the prevalent Greek form Smerdis has assimilated the Persian name to the Greek (Asiatic) name Smerdis or Smerdies, which occurs in the poems of Alcaeus and Anacreon. Smerdis was the younger son of Cyrus the Great who, according to Ctesias, on his deathbed appointed him governor of the eastern provinces (cf. Xen. *Cyrop.* viii. 7, 11). Before Cambyses set out to Egypt, he secretly caused him to be murdered (Darius in the Behistun Inscr. i. 10), being afraid that he might attempt a rebellion during his absence. His death was not known to the people, and so in the spring of 522 a usurper pretended to be Smerdis and proclaimed himself king on a mountain near the Persian town Pishiyauvāda. Owing to the despotic rule of Cambyses and his long absence in Egypt, "the whole people, Persians, Medes and all the other nations," acknowledged the usurper, especially as he granted a remission of taxes for three years (Herod. iii. 68). Cambyses began to march against him, but seeing that his cause was hopeless, killed himself in the spring of 521 (but see further CAMBYSES). The real name of the usurper was, as Darius tells us, Gaumāta, a Magian priest from Media; this name has been preserved by Justin i. 9 (from Charon of Lampsacus?), but given to his brother (called by Herodotus Patizeithes), who is said to have been the real promoter of the intrigue; the true name of the usurper is here given as *Oropastes*; by Ctesias as *Sphendadates*.

The history of the false Smerdis is narrated by Herodotus and Ctesias according to official traditions; Cambyses before his death confessed to the murder of his brother, and in public explained the whole fraud. But, as Darius said, nobody had the courage to oppose the new king, who ruled for seven months over the whole empire. Some contracts dating from his reign have been found in Babylonia, where his name is spelt *Barziya* (for the chronology cf. Ed. Meyer, *Forschungen zur alten Geschichte*, ii. 472 ff.). Darius says that he destroyed some temples, which Darius restored, and took away the herds and houses of the people (Behistun Inscr. i. 14). We have no means of explaining this statement, nor can we fully understand all the incidents connected with his usurpation; but the attempts of modern authors to prove that Gaumāta in reality was the genuine Smerdis and Darius a usurper have failed. It is certain that Smerdis transferred the seat of government to Media; and here in a castle in the district of Nisaya he was surprised and killed by Darius and his six associates in October 521. His death was annually celebrated in Persia by a feast called "the killing of the magian," at which no magian was allowed to show himself (Herod. iii. 79, Ctes. *Pers.* 15).

In the next year, another pseudo-Smerdis, named Vahyazdāta, rose against Darius in eastern Persia and met with great success. But he was finally defeated, taken prisoner and executed (Behistun Inscr. iii. 40 ff.; perhaps he is identical with the King Maraphis "the Maraphian," name of a Persian tribe, who occurs as successor in the list of Persian kings given by Aeschylus, *Pers.* 778).

See DARIUS (I.) and PERSIA, *Ancient History*. (ED. M.)

SMETANA, FRIEDRICH (1824–1884), Bohemian composer and pianist, was born at Leitomischl in Bohemia on the 2nd of March 1824. He made such rapid progress in his studies under Ikavec, at Neuhaus, that at the age of six he appeared in public as pianist so successfully that his father's opposition to a musician's career was overcome. He then went to Proksch, at Prague, until he left for Leipzig to make the acquaintance of Schumann and Mendelssohn. Limited means prevented him from studying with the latter, and he returned to Prague, where he at once became Konzert-meister to the Emperor Ferdinand. In 1848 he married Katharina Kolar, pianist, and with her founded a music school at Prague. At the same time he met Liszt, who subsequently influenced him greatly, and with whom he afterwards stayed at Weimar. In 1856 Smetana accepted Alexander Dreyschock's suggestion to go as conductor of the Philharmonic Society at Gothenburg. There he remained five years, when, owing to his wife's ill-health, he returned to Prague after a successful concert tour. The death of his wife at Dresden on their return caused Smetana to change his mind, and he went back to Sweden. But the opening of the Interims Theater in 1866, and the offer of its conductorship, induced his return. In Sweden he had already written *Hakon Jarl*, *Richard III.*, and *Wallenstein's Lager*, and had completed his opera *Die Brandenburger in Böhmen* (5th January 1866). Five months later it was followed by his best-known opera, *Die verkaufte Braut*, and in 1868 *Dalibor* was given. Between 1874 and 1882 he produced *Zwei Witwen*, *Hubicka* (*Der Kuss*), *Tajewstvi* (*Das Geheimnis*), *Certova Stena*, and *Die Teufelsmauer*, as well as the "grand prize" opera *Libuse*, written for the opening of the National Theatre at Prague, 11th June 1881. In *Die Teufelsmauer* were clear signs of decay in Smetana's powers, he having already in 1874 lost his sense of hearing. To celebrate his sixtieth birthday a fête was arranged by the combined Bohemian musical societies; but on that day Smetana lost his reason and was removed to a lunatic asylum, where he died on the 12th of May 1884. A great deal of his pianoforte music is interesting, the *Stammbuchblätter*, for example; while his series of symphonic poems, entitled *Mein Vaterland* (*Vlast*), and his beautiful string-quartet, *Aus meinem Leben*, have made the tour of the civilized world. He was an admirable pianist, and in many ways justified his countrymen's title of the "Czechisch Beethoven."

SMETHWICK, a municipal and county borough in the Handsworth parliamentary division of Staffordshire, England, 3 m. W. of Birmingham on the Great Western and the London & North Western railways. Pop. (1891) 36,106; (1901) 54,539. There are large glass, chemical and machine works; nuts and bolts are made, and lighthouse fittings are a specialty. Adjoining Smethwick on the E. is the district of Soho, famous as the scene of the engineering experiments of James Watt during his partnership with Matthew Boulton (*c.* 1770). The town of Smethwick is a modern growth about an ancient village, the name of which appears in Domesday. The borough, incorporated in 1899 (county borough, 1907), is under a mayor, 6 aldermen and 18 councillors. Area, 1929 acres.

SMILES, SAMUEL (1812–1904), British author, was born at Haddington, Scotland, on the 23rd of December 1812. He was the eldest of eleven children left, on their father's death, to be supported by their mother on slender means. To her spirit and example must be attributed some of the enthusiasm for self-reliance and self-education, that was later embodied in Dr Smiles's writings and led to their popularity and influence. Educated at the Haddington Grammar School and at Edinburgh University, where he studied medicine and graduated in 1832, Smiles tried, unsuccessfully, to practise in his native village among 3000 healthy Scotsmen and in competition with seven other doctors. He added to his income by lecturing on chemistry and by writing for the press, and, finally abandoning the medical profession, he confined himself to journalism, and from 1838 till 1844 edited the weekly *Leeds Times*. Though he gave up regular journalism in 1844, he continued to be a frequent contributor to periodicals. From 1845 till 1854 he was secretary of the Leeds and Thirsk railway, and from 1854 till 1866 of the South Eastern railway. During his residence in Leeds he had opportunities of studying the characters of the remarkable men whose biographies he afterwards wrote. Here he came in contact with George Stephenson, whose *Life* by him, published in 1857, passed through five editions in its first year and was the precursor of a series of biographies of leaders in the world of industry, such as *Lives of the Engineers* (3 vols., 1861–1862), *Industrial Biography* (1863), *James Brindley and the Early Engineers* (1864), *Lives of Boulton and Watt* (1865), *Life of Thomas Telford* (1867), *The Life of a Scotch Naturalist* (Thomas Edward) (1876), *Robert Dick* (1878), *George Moore* (1878), *Men of Invention and Industry* (1884), *Life and Labour* (1887), *A Publisher and his Friends* (a history of the house of John Murray) (1891), *Jasmin* (1891), *Josiah Wedgwood* (1894). In 1859 had appeared his most successful book, *Self-Help*, a volume of popular ethics; 20,000 copies were sold the first year, and by 1889 the sales had reached 150,000 copies, while the book had been translated into 17 languages. Its success suggested others of similar purpose, like *Character* (1871), *Thrift* (1875), *Duty* (1880). Smiles also published two works dealing with the history of the Huguenots and a *History of Ireland*. His works are not only admirable for their simple and yet forcible style, but for the many useful and practical lessons which they enforce. Wholesome and stimulating, their whole tendency is to inculcate sound principles of life and the building up of manly and upright character. Dr Smiles was made hon. LL.D. of Edinburgh University in 1878, and in 1897 received from the king of Servia the Cross of Knight Commander of the Order of St Sava. He died in Kensington in his ninety-second year, on the 16th of April 1904.

His *Autobiography* was edited (1905) by T. Mackay.

SMILLIE, JAMES DAVID (1833–1909), American artist, was born in New York City on the 16th of January 1833. His father, James Smillie (1807–1885), a Scottish engraver, emigrated to New York in 1829, was elected to the National Academy of Design in 1851, did much, with his brother William Cumming (1813–1908), to develop the engraving of bank-notes, and was an excellent landscape-engraver. The son studied with him and in the National Academy of Design; engraved on steel vignettes for bank-notes and some illustrations, notably F. O. C. Darley's pictures for Cooper's novels; was elected an associate of the National Academy in 1865—the year after he first began painting—and an academician in 1876; and was a founder (1866) of the American Water Color Society, of which he was treasurer in 1866–1873 and president in 1873–1878, and of the New York Etching Club. Among his paintings, in oils, are "Evening among the Sierras" (1876) and "The Cliffs of Normandy" (1885), and in water colour, "A Scrub Race" (1876) and "The Passing Herd" (1888). He wrote and illustrated the article on the Yosemite in *Picturesque America*. He died on the 14th of September 1909. His brother, George Henry Smillie (1840–), studied under his father and under James M. Hart, became a member of the National Academy of Design in 1882, and, like his brother, painted both in oils and in water colour. His favourite subjects were scenes along the New England coast. In 1881 he married Nellie Sheldon Jacobs (b. 1854), a painter of *genre* pictures in oils and water colour.

SMIRKE, ROBERT (1752–1845), English painter, was born at Wigton near Carlisle in 1752. In his thirteenth year he was apprenticed in London with an heraldic painter, and at the age of twenty he began to study in the schools of the Royal Academy, to whose exhibition he contributed in 1786 a "Narcissus" and a "Sabrina," which were followed by many works, usually small in size, illustrative of the English poets, especially Thomson. In 1791 Smirke was elected an associate of the Royal Academy, and two years later a full member. In 1814 he was nominated keeper to the Academy, but the king refused to sanction the appointment on account of the artist's revolutionary opinions. He was engaged upon the Shakespeare gallery, for which he painted "Katharina and Petruchio," "Prince Henry and Falstaff" and other subjects. He also executed many clever and popular book-illustrations. His works, which are frequently humorous, are pleasing and graceful, accomplished in draughtsmanship and handled with considerable spirit. He died in London on the 5th of January 1845.

SMITH, ADAM (1723–1790), English economist, was the only child of Adam Smith, comptroller of the customs at Kirkcaldy in Fifeshire, Scotland, and of Margaret Douglas, daughter of Mr Douglas of Strathendry, near Leslie. He was born at Kirkcaldy on the 5th of June 1723, some months after the death of his father. When he was three years old he was taken on a visit to his uncle at Strathendry, and when playing alone was carried off by a party of "tinkers." He was at once missed, and the vagrants pursued and overtaken in Leslie wood. He received his early education in the school of Kirkcaldy under David Miller, amongst whose pupils were many who were afterwards distinguished men. Smith showed great fondness for books and remarkable powers of memory; and he was popular among his schoolfellows. He was sent in 1737 to the university of Glasgow, where he attended the lectures of Dr Hutcheson; and in 1740 he went to Balliol College, Oxford, as exhibitioner on Snell's foundation. He remained at that university for seven years. At Glasgow his favourite studies had been mathematics and natural philosophy; but at Oxford he appears to have devoted himself almost entirely to moral and political science and to ancient and modern languages. He also laboured to improve his English style by translation, particularly from the French. After his return to Kirkcaldy he resided there two years with his mother, continuing his studies, not having yet adopted any plan for his future life. In 1748 he removed to Edinburgh, and there, under the patronage of Lord Kames, gave lectures on rhetoric and belles-lettres. About this time began his acquaintance with David Hume, which afterwards ripened into friendship. In 1751 he was elected professor of logic at Glasgow, and in 1752 was transferred to the chair of moral philosophy, which had become vacant by the death of Thomas Craigie, the successor of Hutcheson. This position he occupied for nearly twelve years, which he long afterwards declared to have been "by far the most useful, and therefore by far the happiest and most honourable period of his life." His course of lectures was divided into four parts—(1) natural theology; (2) ethics; (3) a treatment of that branch of morality which relates to justice, a subject which he handled historically after the manner of Montesquieu; (4) a study of those political regulations which are founded, not upon the principle of justice, but that of expediency, and which are calculated to increase the riches, the power and the prosperity of a state. Under this view he considered the political institutions relating to commerce, to finances, to ecclesiastical and military establishments. He first appeared as an author by contributing two articles to the *Edinburgh Review* (an earlier journal than the present, which was commenced in 1755, but of which only two numbers[1] were published),—one on Johnson's *Dictionary* and the other a letter to the editors on the state of literature in the different countries of Europe. In 1759 appeared his *Theory of Moral Sentiments*, embodying the second portion of his university course, to which was added in the 2nd edition an appendix with the title, "Considerations concerning the first Formation of Languages." After the publication of this work his ethical doctrines occupied less space in his lectures, and a larger development was given to the subjects of jurisprudence and political economy. Stewart gives us to understand that he had, as early as 1752, adopted the liberal views of commercial policy which he afterwards preached; and this we should have been inclined to believe independently from the fact that such views

[1] These two numbers were reprinted in 1818. Smith's letter to the editors is specially interesting for its account of the *Encyclopédie* and its criticism of Rousseau's pictures of savage life.

were propounded in that year in the *Political Discourses* of Hume.

In 1762 the senatus academicus of Glasgow conferred on him the honorary degree of doctor of laws. In 1763 he was invited to take charge of the young duke of Buccleuch on his travels. He accepted, and resigned his professorship. He went abroad with his pupil in February 1764; they remained only a few days at Paris and then settled at Toulouse, at that time the seat of a parlement, where they spent eighteen months in the best society of the place, afterwards making a tour in the south of France and passing two months at Geneva. Returning to Paris about Christmas of 1765, they remained there till the October of the following year. Smith at this time lived in the society of Quesnay, Turgot, d'Alembert, Morellet, Helvétius, Marmontel and the duke de la Rochefoucauld. His regard for the young nobleman[1] last named dictated the omission in the later editions of his *Moral Sentiments* of the name of the celebrated ancestor of the duke, whom he had associated with Mandeville as author of one of the "licentious systems" reviewed in the seventh part of that work. Smith was much influenced by his contact with the members of the physiocratic school, especially with its chief, though Dupont de Nemours probably goes too far in speaking of Smith and himself as having been "con-disciples chez M. Quesnay." Smith afterwards described Quesnay as a man "of the greatest modesty and simplicity," and declared his system of political economy to be, "with all its imperfections, the nearest approximation to truth that had yet been published on the principles of that science." In October 1766 tutor and pupil returned home, and they ever afterwards retained strong feelings of mutual esteem. For the next ten years Smith lived with his mother at Kirkcaldy, only paying occasional visits to Edinburgh and London; he was engaged in close study during most of this time. He describes himself to Hume during this period as being extremely happy. He was occupied on his *Inquiry into the Nature and Causes of the Wealth of Nations*, which there is some reason for believing he had begun at Toulouse. That great work appeared in 1776.[2] After its publication, and only a few months before his own death, Hume wrote to congratulate his friend—"*Euge! belle!* dear Mr Smith, I am much pleased with your performance, and the perusal of it has taken me from a state of great anxiety. It was a work of so much expectation, by yourself, by your friends, and by the public, that I trembled for its appearance, but am now much relieved. Not but that the reading of it necessarily requires so much attention, and the public is disposed to give so little, that I shall still doubt for some time of its being at first very popular, but it has depth, and solidity, and acuteness, and is so much illustrated by curious facts that it must at last attract the public attention." Smith attended Hume during a part of his last illness, and soon after the death of the philosopher there was published, along with his autobiography a letter from Smith to W. Strahan (Smith's publisher) in which he gave an account of the closing scenes of his friend's life and expressed warm admiration for his character. This letter excited some rancour among the theologians, and Dr George Horne, afterwards bishop of Norwich, published in 1777 *A Letter to Adam Smith on the Life, Death and Philosophy of his Friend David Hume, by one of the people called Christians.* But Smith took no notice of this effusion.[3] He was also attacked by Archbishop W. Magee (1766–1831) for the omission in subsequent editions of a passage of the *Moral Sentiments* which that prelate had cited with high commendation as among the ablest illustrations of the doctrine of the atonement. Smith had omitted the paragraph in question (an omission which had escaped notice for twenty years) on the ground that it was unnecessary and misplaced; but Magee suspected him of having been influenced by deeper reasons.

The greater part of the two years which followed the publication of the *Wealth of Nations* Smith spent in London, enjoying the society of eminent persons, amongst whom were Gibbon, Burke, Reynolds and Topham Beauclerk. In 1778 he was appointed, through the influence of the duke of Buccleuch, one of the commissioners of customs in Scotland, and in consequence of this fixed his residence at Edinburgh. His mother, now in extreme old age, lived with him, as did also his cousin, Miss Jane Douglas, who superintended his household. Much of his now ample income is believed to have been spent in secret charities, and he kept a simple table at which, "without the formality of an invitation, he was always happy to receive his friends." "His Sunday suppers," says M'Culloch, "were long celebrated at Edinburgh." One of his favourite places of resort in these years was a club of which Dr Hutton, Dr Black, Dr Adam Ferguson, John Clerk the naval tactician, Robert Adam the architect, as well as Smith himself, were original members, and to which Dugald Stewart, Professor Playfair and other eminent men were afterwards admitted. Another source of enjoyment was his small but excellent library; it is still preserved in his family.[4] In 1787 he was elected lord rector of the university of Glasgow, an honour which he received with "heartfelt joy." If we can believe a note in Wilberforce's *Correspondence*, he visited London in the spring of the same year, and was introduced by Dundas[5] to Pitt, Wilberforce and others. From the death of his mother in 1784, and that of Miss Douglas in 1788, his health declined, and after a painful illness he died on the 17th of July 1790.

Before his decease Smith directed that all his manuscripts except a few selected essays should be destroyed, and they were accordingly committed to the flames. Of the pieces preserved by his desire the most valuable is his tract on the history of astronomy, which he himself described as a "fragment of a great work"; it was doubtless a portion of the "connected history of the liberal sciences and elegant arts" which, we are told, he had projected in early life. Among the papers destroyed were probably, as Stewart suggests, the lectures on natural religion and jurisprudence which formed part of his course at Glasgow, and also the lectures on rhetoric which he delivered at Edinburgh in 1748. To the latter Hugh Blair seems to refer when, in his work on *Rhetoric and Belles-Lettres* (1783), he acknowledges his obligations to a manuscript treatise on rhetoric by Smith, part of which its author had shown to him many years before, and which he hoped that Smith would give to the public. Smith had promised at the end of his *Theory of Moral Sentiments* a treatise on jurisprudence from the historical point of view.

As a moral philosopher Smith cannot be said to have won much acceptance for his fundamental doctrine. This doctrine is that all our moral sentiments arise from sympathy, that is, from the principle of our nature "which leads us to enter into the situations of other men and to partake with them in the passions which those situations have a tendency to excite." Our direct sympathy with the agent in the circumstances in which he is placed gives rise, according to this view, to our notion of the propriety of his action, whilst our indirect sympathy with those whom his actions have benefited or injured gives rise to our notions of merit and demerit in the agent himself. It seems justly alleged against this system by Dr Thomas Brown that "the moral sentiments, the origin of which it ascribes to our secondary feelings of mere sympathy, are assumed as previously existing in the original emotions with which the secondary feelings are said to be in unison." A second objection urged, perhaps with less justice, against the theory is that it fails to account for the

[1] The duke undertook a translation of the *Theory of Moral Sentiments*, but the Abbé Blavet's version appeared (1774) before his was completed and he then relinquished the design. An earlier French translation had been published (1764) under the title *Métaphysique de l'âme*; and there is a later one—the best—by the marquis de Condorcet (1798, 2nd ed., 1830).

[2] J. E. Thorold Rogers published in the *Academy*, 28th February 1885, a letter of Smith to William Pulteney, written in 1772, from which he thought it probable that the work lay "unrevised and unaltered" in the author's desk for four years. A similar conclusion seems to follow from a letter of Hume in Burton's *Life*, ii. 461.

[3] A story was told by Sir Walter Scott, and is also related in the *Edinburgh Review*, of an "unfortunate rencontre," arising out of the publication of the same letter, between Smith and Dr Johnson, during the visit of the latter to Glasgow. The same story is given in a note in Wilberforce's *Correspondence*, the scene being somewhat vaguely laid in "Scotland." But it cannot be true; for Johnson made his tour in 1773, whilst Hume's death did not take place till 1776. Smith seems not to have met Johnson in Scotland at all. It appears, however, from Boswell's *Life*, under date of 29th April 1778, that Johnson had on one occasion quarrelled with Smith at Strahan's house, apparently in London; it is clear that the "unlucky altercation" at Strahan's must have occurred in 1761 or 1763, and could have had nothing to do with the letter on Hume's death.

[4] See *Catalogue of the Library of Adam Smith*, edited with notes and introduction, by James Bonar (1894).

[5] An interesting letter of Smith to Dundas (1st November 1779) on free trade for Ireland is printed in the *Eng. Hist. Review*, No. 2.

authoritative character which is felt to be inherent in our sense of right and wrong—for what Butler calls the "supremacy of conscience."

It is on the *Wealth of Nations* that Smith's fame rests. But it must at once be said that it is plainly contrary to fact to represent him, as some have done, as the creator of political economy. The subject of social wealth had always in some degree, and increasingly in recent times, engaged the attention of philosophic minds. The study had even indisputably assumed a systematic character, and, from being an assemblage of fragmentary disquisitions on particular questions of national interest, had taken the form, notably in Turgot's *Réflexions*, of an organized body of doctrine. The truth is that Smith took up the science when it was already considerably advanced; and it was this very circumstance which enabled him, by the production of a classical treatise, to render most of his predecessors obsolete.

Even those who do not fall into the error of making Smith the creator of the science, often separate him too broadly from Quesnay and his followers, and represent the history of modern economics as consisting of the successive rise and reign of three doctrines—the mercantile, the physiocratic and the Smithian. The last two are, it is true, at variance in some even important respects. But it is evident, and Smith himself felt, that their agreements were much more fundamental than their differences; and, if we regard them as historical forces, they must be considered as working towards identical ends. They both urged society towards the abolition of the previously prevailing industrial policy of European governments; and their arguments against that policy rested essentially on the same grounds.

The history of economic opinion in modern times, down to the third decade of the 19th century, is, in fact, strictly bipartite. The first stage is filled with the mercantile system, which was rather a practical policy than a speculative doctrine, and which came into existence as the spontaneous growth of social conditions acting on minds not trained to scientific habits. The second stage is occupied with the gradual rise and ultimate ascendancy of another system founded on the idea of the right of the individual to an unimpeded sphere for the exercise of his economic activity. With the latter, which is best designated as the "system of natural liberty," we ought to associate the memory of the physiocrats as well as that of Smith, without, however, maintaining their services to have been equal to his.

The teaching of political ecomomy was associated in the Scottish universities with that of moral philosophy. Smith conceived the entire subject he had to treat in his public lectures as divisible into four heads, the first of which was natural theology, the second ethics, the third jurisprudence; whilst in the fourth "he examined those political regulations which are founded upon expediency, and which are calculated to increase the riches, the power, and the prosperity of a state." The last two branches of inquiry are regarded as forming but a single body of doctrine in the well-known passage of the *Theory of Moral Sentiments* in which the author promises to give in another discourse "an account of the general principles of law and government, and of the different revolutions they have undergone in the different ages and periods of society, not only in what concerns justice, but in what concerns police, revenue and arms, and whatever else is the subject of law." This shows how little it was Smith's habit to separate (except provisionally), in his conceptions or his researches, the economic phenomena of society from all the rest. The words above quoted have, indeed, been not unjustly described as containing "an anticipation, wonderful for his period, of general sociology."

There has been much discussion on the question—What is the scientific method followed by Smith in his great work? By some it is considered to have been purely deductive, a view which Buckle has perhaps carried to the greatest extreme. He asserts that in Scotland the inductive method was unknown, and that although Smith spent some of the most important years of his youth in England, where the inductive method was supreme, he yet adopted the deductive method because it was habitually followed in Scotland. That the inductive spirit exercised no influence on Scottish philosophers is certainly not true; Montesquieu, whose method is essentially inductive, was in Smith's time closely studied by Smith's fellow-countrymen. What may justly be said of Smith is that the deductive bent was not the predominant character of his mind, nor did his great excellence lie in the "dialectic skill" which Buckle ascribes to him. What strikes us most in his book is his wide and keen observation of social facts, and his perpetual tendency to dwell on these and elicit their significance, instead of drawing conclusions from abstract principles by elaborate chains of reasoning.

That Smith does, however, largely employ the deductive method is certain; and that method is legitimate when the premises from which the deduction sets out are known universal facts of human nature and properties of external objects. But there is another species of deduction which, as Cliffe Leslie has shown, seriously tainted the philosophy of Smith—in which the premises are not facts ascertained by observation, but the a priori assumptions which we found in the physiocrats. In his view, Nature has made provision for social wellbeing by the principle of the human constitution which prompts every man to better his condition: the individual aims only at his private gain, but is "led by an invisible hand" to promote the public good; human institutions, by interfering with this principle in the name of the public interest, defeat their own end; but, when all systems of preference or restraint are taken away, "the obvious and simple system of natural liberty establishes itself of its own accord." This theory is, of course, not explicitly presented by Smith as a foundation of his economic doctrines, but it is really the secret substratum on which they rest. Yet, whilst such latent postulates warped his view of things, they did not entirely determine his method. His native bent towards the study of things as they are preserved him from extravagances into which many of his followers have fallen. But besides this, as Leslie has pointed out, the influence of Montesquieu tended to counterbalance the theoretic prepossessions produced by the doctrine of the *jus naturae.* We are even informed that Smith himself in his later years was occupied in preparing a commentary on the *Esprit des lois.* He was thus affected by two different and incongruous systems of thought—one setting out from an imaginary code of nature intended for the benefit of man, and leading to an optimistic view of the economic constitution founded on enlightened self-interest; the other following inductive processes, and seeking to explain the several states in which the human societies are found existing, as results of circumstances or institutions which have been in actual operation. And we find accordingly in his great work a combination of inductive inquiry with a priori speculation founded on the "Nature" hypothesis.

Some have represented Smith's work as of so loose a texture and so defective in arrangement that it may be justly described as consisting of a series of monographs. But this is certainly an exaggeration. The book, it is true, is not framed on a rigid mould, nor is there any parade of systematic divisions and subdivisions. But, as a body of exposition, it has the real unity which results from a mode of thinking homogeneous throughout and the general absence of such contradictions as would arise from an imperfect digestion of the subject.

Smith sets out from the thought that the annual labour of a nation is the source from which it derives its supply of the necessaries and conveniences of life. He does not of course contemplate labour as the only factor in production; but it has been supposed that by emphasizing it at the outset he at once strikes the note of difference between himself on the one hand, and both the mercantilists and the physiocrats on the other. The improvement in the productiveness of labour depends largely on its division; and he proceeds accordingly to give his unrivalled exposition of that principle, of the grounds on which it rests, and of its greater applicability to manufactures than to agriculture, in consequence of which the latter relatively lags behind in the course of economic development. The origin of the division of labour he finds in the propensity of human nature "to truck, barter or exchange one thing for another." He shows that a certain accumulation of capital is a condition precedent of this division, and that the degree to which it can be carried is dependent on the extent of the market. When the division of labour has been established, each member of the society must have recourse to the others for the supply of most of his wants; a medium of exchange is thus found to be necessary, and money comes into use. The exchange of goods against each other or against money gives rise to the notion of value. This word has two meanings—that of utility, and that of purchasing power; the one may be called value in use, the other value in exchange. Merely mentioning the former, Smith goes on to study the latter. What, he asks, is the measure of value? what regulates the amount of one thing which will be given for another? "Labour," Smith answers, "is the real measure of the exchangeable value of all commodities." "Equal quantities of labour at all times and places, are of equal value to the labourer." "Labour alone, therefore, never varying in its own value, is alone the ultimate and real standard by which the value of all commodities can at all times and places be estimated and compared. It is their real price; money is their nominal price only." Money, however, is in men's actual transactions the measure of value, as well as the vehicle of exchange; and the precious metals are best suited for this function, as varying little in their own value for periods of moderate length; for distant times, corn is a better standard of comparison. In relation to the earliest social stage, we need consider nothing but the amount of labour employed in the production of an article as determining its exchange value; but in more advanced periods price is complex, and consists in the most general case of three elements—wages, profit and rent. Wages are the reward of labour. Profit arises as soon as stock, being accumulated in the hands of one person, is employed by him in setting others to work, and supplying them with materials and subsistence, in order to make a gain by what they produce. Rent arises as soon as the land of a country has all become private property; "the landlords, like all other men, love to reap where they never sowed, and demand a rent even for its natural produce." In every improved society, then, these three elements enter more or less into the price of the far greater part of commodities. There is in every society or neighbourhood, an ordinary or average rate of wages and profit in every different employment of labour and stock, regulated by principles to be explained hereafter, as also an ordinary or average rate of rent. These may be called the natural rates at the time when and the place where they prevail; and the natural price of a commodity is what is sufficient to pay for the rent of the land, the wages of the labour, and the profit of the stock necessary for bringing the commodity to market. The market price may rise above or fall below the amount so fixed, being determined by the proportion between the quantity brought to market and the demand of those who are willing to pay the natural price. Towards the natural price as a centre the market-price, regulated by competition, constantly gravitates. Some commodities, however, are subject to a monopoly of production, whether from the peculiarities of a locality or from legal privilege: their price is always the highest that can be got; the natural price of other commodities is the lowest which can be taken for any length of time together. The three component parts or factors of price vary with the circumstances of the society. The rate of wages is determined by a "dispute" or struggle of opposite interests between the employer and the workman. A minimum rate is fixed by the condition that they must be at least sufficient to enable a man and his wife to maintain themselves and, in general, bring up a family. The excess above this will depend on the circumstances of the country, and the consequent demand for labour—wages being high when national wealth is increasing, low when it is declining. The same circumstances determine the variation of profits, but in an opposite direction; the increase of stock, which raises wages, tending to lower profit through the mutual competition of capitalists. "The whole of the advantages and disadvantages of the different employments of labour and stock must, in the same neighbourhood, be either perfectly equal or continually tending to equality"; if one had greatly the advantage over the others, people would crowd into it, and the level would soon be restored. Yet pecuniary wages and profits are very different in different employments—either from certain circumstances affecting the employments, which recommend or disparage them in men's notions, or from national policy, "which nowhere leaves things at perfect liberty." Here follows Smith's admirable exposition of the causes which produce the inequalities in wages and profits just referred to, a passage affording ample evidence of his habits of nice observation of the less obvious traits in human nature, and also of the operation both of these and of social institutions on economic facts. The rent of land comes next to be considered, as the last of the three elements of price. Rent is a monopoly price, equal, not to what the landlord could afford to take, but to what the farmer can afford to give. "Such parts only of the produce of land can commonly be brought to market, of which the ordinary price is sufficient to replace the stock which must be employed in bringing them thither, together with the ordinary profits. If the ordinary price is more than this, the surplus part will naturally go to the rent of the land. If it is not more, though the commodity may be brought to market, it can afford no rent to the landlord. Whether the price is or is not more depends on the demand." "Rent, therefore, enters into the price of commodities in a different way from wages and profits. High or low wages and profit are the causes of high or low price; high or low rent is the effect of it."

Rent, wages and profits, as they are the elements of price, are also the constituents of income; and the three great orders of every civilized society, from whose revenues that of every other order is ultimately derived, are the landlords, the labourers and the capitalists. The relation of the interests of these three classes to those of society at large is different. The interest of the landlord always coincides with the general interest: whatever promotes or obstructs the one has the same effect on the other. So also does that of the labourer: when the wealth of the nation is progressive, his wages are high; they are low when it is stationary or retrogressive. "The interest of the third order has not the same connexion with the general interest of the society as that of the other two; . . . it is always in some respects different from and opposite to that of the public."

The subject of the second book is "the nature, accumulation and improvement of stock." A man's whole stock consists of two portions—that which is reserved for his immediate consumption, and that which is employed so as to yield a revenue to its owner. This latter, which is his "capital," is divisible into the two classes of "fixed" and "circulating." The first is such as yields a profit without passing into other hands. The second consists of such goods, raised, manufactured or purchased, as are sold for a profit and replaced by other goods; this sort of capital is therefore constantly going from and returning to the hands of its owner. The whole capital of a society falls under the same two heads. Its fixed capital consists chiefly of (1) machines, (2) buildings which are the means of procuring a revenue, (3) agricultural improvements and (4) the acquired and useful abilities of all members of the society (since sometimes known as "personal capital"). Its circulating capital is also composed of four parts—(1) money, (2) provisions in the hands of the dealers, (3) materials and (4) completed work in the hands of the manufacturer or merchant. Next comes the distinction of the gross national revenue from the net—the first being the whole produce of the land and labour of a country, the second what remains after deducting the expense of maintaining the fixed capital of the country and that part of its circulating capital which consists of money. Money, "the great wheel of circulation," is altogether different from the goods which are circulated by means of it; it is a costly instrument by means of which all that each individual receives is distributed to him; and the expenditure required, first to provide it, and afterwards to maintain it, is a deduction from the net revenue of the society. In development of this consideration, Smith goes on to explain the gain to the community arising from the substitution of paper money for that composed of the precious metals; and here occurs the remarkable illustration in which the use of gold and silver money is compared to a highway on the ground, that of paper money to a wagon way through the air. In proceeding to consider the accumulation of capital, he is led to the distinction between productive and unproductive labour—the former being that which is fixed or realized in a particular object or vendible article, the latter that which is not so realized. The former is exemplified in the labour of the manufacturing workman, the latter in that of the menial servant. A broad line of demarcation is thus drawn between the labour which results in commodities or increased value of commodities, and that which does no more than render services: the former is productive, the latter unproductive. "Productive" is by no means equivalent to "useful": the labours of the magistrate, the soldier, the churchman, lawyer and physician, are, in Smith's sense, unproductive. Productive labourers alone are employed out of capital; unproductive labourers, as well as those who do not labour at all, are all maintained by revenue. In advancing industrial communities, the portion of annual produce set apart as capital, bears an increasing proportion to that which is immediately destined to constitute a revenue, either as rent or as profit. Parsimony is the source of the increase of capital; by augmenting the fund devoted to the maintenance of productive hands, it puts in motion an additional quantity of industry, which adds to the value of the annual produce. What is annually saved is as regularly consumed as what is spent, but by a different set of persons, by productive labourers instead of idlers or unproductive labourers; and the former reproduce with a profit the value of their consumption. The prodigal, encroaching on his capital, diminishes, as far as in him lies, the amount of productive labour, and so the wealth of the country; nor is this result affected by his expenditure being on home-made, as distinct from foreign commodities. Every prodigal, therefore, is a public enemy; every frugal man a public benefactor. The only mode of increasing the annual produce of the land and labour is to increase either the number of productive labourers or the productive powers of those labourers. Either process will in general require additional capital, the former to maintain the new labourers, the latter to provide improved machinery or to enable the employer to introduce a more complete division of labour. In what are commonly called loans of money, it is not really the money, but the money's worth, that the borrower wants; and the lender really assigns to him the right to a certain portion of the annual produce of the land and labour of the country. As the general capital of a country increases, so also does the particular portion of it from which the possessors wish to derive a revenue without being at the trouble of employing it themselves, and, as the quantity of stock thus available for loans is augmented, the interest diminishes, not merely "from the general causes which make the market price of things commonly diminish as their quantity increases," but because, with the increase of capital, "it becomes gradually more and more difficult to find within the country a profitable method of employing any new capital"—whence arises a competition between different capitals, and a lowering of profits, which must diminish the price which can be paid for the use of capital, or in other words the rate of interest. It was formerly wrongly supposed, and even Locke and Montesquieu did not escape this error, that the fall in the value of the precious metals consequent on the discovery of the American mines was the real cause of the general lowering of the rate of interest in Europe. But this view, already refuted by Hume, is easily seen to be erroneous. "In some countries the interest of money has been prohibited by law. But, as something can everywhere be made by the use of money, something ought everywhere to be paid for the use of it," and will in fact be paid for it; and the prohibition will only heighten the evil of usury by increasing the risk to the lender. The legal rate should be a very little above the lowest market rate; sober people will then be preferred as borrowers to prodigals and projectors, who at a higher legal rate would have an advantage over them, being alone willing to offer that higher rate.

As to the different employments of capital, the quantity of productive labour put in motion by an equal amount varies extremely according as that amount is employed—(1) in the improvement of lands, mines or fisheries, (2) in manufactures, (3) in wholesale or (4) retail trade. In agriculture "Nature labours along with man," and not only the capital of the farmer is reproduced with his profits, but also the rent of the landlord. It is therefore the employment of a given capital which is most advantageous to society. Next in order come manufactures; then wholesale trade—first the home trade, secondly the foreign trade of consumption, last the carrying trade. All these employments of capital, however, are not only advantageous, but necessary, and will introduce themselves in the due degree if left to individual enterprise.

These first two books contain Smith's general economic scheme; and we have stated it as fully as was consistent with the brevity here necessary, because from this formulation of doctrine the English classical school set out, and round it the discussions of more modern times in different countries have in a great measure revolved.

The critical philosophers of the 18th century were often destitute of the historical spirit, which was no part of the endowment needed for their principal social office. But some of the most eminent of them, especially in Scotland, showed a marked capacity and predilection for historical studies. Smith was among the latter; Karl Knies and others justly remark on the masterly sketches of this kind which occur in the *Wealth of Nations*. The longest and most elaborate of these occupies the third book; it is an account of the course followed by the nations of modern Europe in the successive development of the several forms of industry. It affords a curious example of the effect of doctrinal prepossessions in obscuring the results of historical inquiry. Whilst he correctly describes the European movement of industry, and explains it as arising out of adequate social causes, he yet, in accordance with the absolute principles which tainted his philosophy, protests against it as involving an entire inversion of the "natural order of things." First agriculture, then manufactures, lastly foreign commerce; any other order than this he considers "unnatural and retrograde."

The fourth book is principally devoted to the elaborate and exhaustive polemic against the mercantile system which finally drove it from the field of science, and has exercised a powerful influence on economic legislation. When protection is now advocated, it is commonly on different grounds from those which were in current use before the time of Smith. He believed that to look for the restoration of freedom of foreign trade in Great Britain would have been "as absurd as to expect that an Oceana or Utopia should be established in it." His teaching on the subject is not altogether unqualified; but, on the whole, with respect to exchanges of every kind, where economic motives alone enter, his voice is in favour of freedom. He has regard, however, to political as well as economic interests, and on the ground that "defence is of much more importance than opulence" pronounces the Navigation Act to have been "perhaps the wisest of all the commercial regulations of England." Whilst objecting to the prevention of the export of wool, he proposes a tax on that export as somewhat less injurious to the interest of growers than the prohibition, whilst it would "afford a sufficient advantage" to the domestic over the foreign manufacturer. This is, perhaps, his most marked deviation from the rigour of principle; it was doubtless a concession to popular opinion with a view to an attainable practical improvement The wisdom of retaliation in order to procure the repeal of high duties or prohibitions imposed by foreign governments depends, he says, altogether on the likelihood of its success in effecting the object aimed at, but he does not conceal his contempt for the practice of such expedients. The restoration of freedom in any manufacture, when it has grown to considerable dimensions by means of high duties, should, he thinks, from motives of humanity, be brought about only by degrees and with circumspection—though the amount of evil which would be caused by the immediate abolition of the duties is, in his opinion, commonly exaggerated The case in which J S Mill justified protection—that, namely, in which an industry well adapted to a country is kept down by the acquired ascendancy of foreign producers—is referred to by Smith; but he is opposed to the admission of this exception for reasons which do not appear to be conclusive He is perhaps scarcely consistent in approving the concession of temporary monopolies to joint-stock companies undertaking risky enterprises "of which the public is afterwards to reap the benefit."[1]

He is less absolute in his doctrine of governmental non-interference when he comes to consider in his fifth book the "expenses of the sovereign or the commonwealth." He recognizes as coming within the functions of the state the erection and maintenance of those public institutions and public works which, though advantageous to the society, could not repay, and therefore must not be thrown upon, individuals or small groups of individuals. He remarks in a just historical spirit that the performance of these functions requires very different degrees of expense in the different periods of society. Besides the institutions and works intended for public defence and the administration of justice, and those required for facilitating the commerce of the society, he considers those necessary for promoting the instruction of the people. He thinks the public at large may with propriety not only facilitate and encourage, but even impose upon almost the whole body of the people, the acquisition in youth of the most essential elements of education. He suggests as the mode of enforcing this obligation the requirement of submission to a test examination "before any one could obtain the freedom in any corporation, or be allowed to set up a trade in any village or town corporate." Similarly, he is of opinion that some probation, even in the higher and more difficult sciences, might be enforced as a condition of exercising any liberal profession, or becoming a candidate for any honourable office. The expense of the institutions for religious instruction as well as for general education, he holds, may without injustice be defrayed out of the funds of the whole society, though he would apparently prefer that it should be met by the voluntary contributions of those who think they have occasion for such education or instruction.

To sum up, it may be said that the *Wealth of Nations* certainly operated powerfully through the harmony of its critical side with the tendencies of the half-century which followed its publication to the assertion of personal freedom and "natural rights." It discredited the economic policy of the past, and promoted the overthrow of institutions which had come down from earlier times, but were unsuited to modern society. As a theoretic treatment of social economy, and therefore as a guide to social reconstruction and practice in the future, it is provisional, not definitive. But when the study of its subject comes to be systematized on the basis of a general social philosophy more complete and durable than Smith's, no contributions to that final construction will be found so valuable as his.

Buckle has the idea that the two principal works of Smith, the *Theory of Moral Sentiments* and the *Wealth of Nations*, are mutually complementary parts of one great scheme, in which human nature is intended to be dealt with as a whole—the former exhibiting the operation of the benevolent feelings, the latter of what, by a singular nomenclature, inadmissible since Butler wrote, he calls "the passion of selfishness." In each division the motive contemplated is regarded as acting singly, without any interference of the opposite principle. This appears to be an artificial and misleading notion. Neither in the plan of Smith's university course nor in the well-known passage at the end of his *Moral Sentiments* is there any indication of his having conceived such a bipartite scheme. The object of the *Wealth of Nations* is surely in no sense psychological, as is that of the *Moral Sentiments*. The purpose of the work is to exhibit social phenomena, not to demonstrate their source in the mental constitution of the individual.

The following may be referred to for biographical details: Dugald Stewart, *Biographical Memoir of Adam Smith*, originally read (1793) before the Royal Society of Edinburgh, and afterwards prefixed to Smith's *Essays on Philosophical Subjects*; J. A. Farrer, *Adam Smith* (1881); R. B. Haldane, *Life of Smith* (1887), and the very full and excellent *Life of Adam Smith* by John Rae (1895). Additional particulars are given in Brougham's *Men of Letters and Science*, Burton's *Life of Hume* and Alexander Carlyle's *Autobiography*; and some characteristic anecdotes of him will be found in *Memoirs of the Life and Works of Sir John Sinclair* (1837). For comments on his *Theory of Moral Sentiments*, see, besides Stewart, as cited above, Dr T. Brown's *Philosophy of the Human Mind*, lects. 80 and 81; Sir J. Mackintosh's *Dissertation on the Progress of Ethical Philosophy*; and the art. ETHICS in the present work. On the *Wealth of Nations*, see the prefaces to M'Culloch's, Rogers's, Shield Nicholson's and Cannan's editions of that work; Rogers's *Historical Gleanings* (1869); the art. "Smith" in Coquelin and Guillaumin's *Dictionnaire de l'économie politique*; Bagehot's *Economic Studies* (1880); and Cossa's *Guide to the Study of Political Economy* (Eng. trans., 1880), chap. v. See also Professor Shield Nicholson's *Project of Empire* (1909), which is a critical study of the Economics of Imperialism, with special reference to the ideas of Adam Smith; and Professor W. J. Ashley's essay in *Compatriots Club Lectures* (1905) on "Political Economy and the Tariff Problem." See also Professor W. J. Ashley's *Select Chapters and Passages from the "Wealth of Nations"* (1895). (J. K. I.; X)

[1] Professor Bastable calls attention to the interesting fact that the proposal of an export duty on wool and the justification of a temporary monopoly to joint-stock companies both appear for the first time in the edition of 1784

SMITH, ALBERT RICHARD (1816–1860), English author and public entertainer, was born at Chertsey, Surrey, on the 24th of May 1816. He studied medicine in Paris, and his first literary effort was an account of his life there, which appeared in the *Mirror*. He gradually relinquished his medical work for light literature. Though a journalist rather than a literary figure, he was one of the most popular men of his time, and a favourite humorist in the vein of humour then in vogue. He was one of the early contributors to *Punch* and was also a regular contributor to *Bentley's Miscellany*, in whose pages his first and best book, *The Adventures of Mr Ledbury*, appeared in 1842. His other books were, *Christopher Tadpole* (1848), issued in monthly parts, *Pottleton's Legacy* (1849), and a series of so-called natural histories, *The Gent*, *The Ballet Girl*, *The Idler upon Town* and *The Flirt*. Albert Smith also wrote extravaganzas and adapted some of Charles Dickens's stories for the stage. He founded and edited a monthly magazine called *The Man in the Moon*, from 1847 to 1849. In 1851 he ascended Mont Blanc, and the year after produced at the Egyptian Hall the descriptive entertainment, which he called "Mont Blanc," describing the ascent of the mountain and the Englishman abroad. This success was followed by other entertainments of the kind, among them "China." Smith married in 1859 a daughter of Robert Keeley, the comedian. He died in Fulham, London, on the 23rd of May 1860. Smith received great help from his brother, Arthur W. W. Smith (1825–1861), who had also been educated for medicine. He managed the entertainments at the Egyptian Hall from 1852 to 1860. He also planned Charles Dickens's readings in 1858, and made arrangements for a second series, but died before they were completed.

SMITH, ALEXANDER (1830–1867), Scottish poet, son of a lace-designer, was born at Kilmarnock on the 31st of December 1830. His parents being too poor to send him to college, he was placed in a linen factory to follow his father's trade of a pattern designer. His early poems appeared in the *Glasgow Citizen*, in whose editor, James Hedderwick, he found a sympathizing and appreciative friend. *A Life Drama and other Poems* (1853) was a work of promise, ran through several editions, and gained Smith the appointment of secretary to Edinburgh University in 1854. As a poet he was one of the leading representatives of what was called the "Spasmodic" School, now fallen into oblivion. Smith, P. J. Bailey and Sydney Dobell were satirized by W. E. Aytoun in 1854 in *Firmilian: a Spasmodic Tragedy*. In the same year Sydney Dobell came to Edinburgh, and an acquaintanceship at once sprang up between the two, which resulted in their collaboration in a book of *War Sonnets* (1855), inspired by the Crimean War. After publishing *City Poems* (1857) and *Edwin of Deira* (1861), a Northumbrian epic poem, Smith turned his attention to prose, and published *Dreamthorp: Essays written in the Country* (1863) and *A Summer in Skye*. His last work was an experiment in fiction, *Alfred Hagart's Household* (1866), which ran first through *Good Words*. He died on the 5th of January 1867.

A memoir of Smith by P. P. Alexander was prefixed to a volume entitled *Last Leaves*.

SMITH, ANDREW JACKSON (1815–1897), American soldier, was born in Bucks county, Pennsylvania, on the 28th of April 1815 and graduated at West Point in 1838. He was engaged on active service on the south-west frontier and in Mexico, and afterwards in Indian warfare in Washington and Oregon territories, becoming first lieutenant in 1845, captain in 1847, and major in 1861. In the latter year, on the outbreak of the Civil War, he became a colonel of volunteer cavalry in the Federal army, rising early in 1862 to the rank of brigadier-general U.S.V., and to the chief command of the cavalry in the Missouri department. Assigned afterwards to the Army of the Tennessee, he took part in the first attack on Vicksburg and the capture of Arkansas Post, and commanded a division of the XIII. corps in the final Vicksburg campaign. Later he led a division of the XVI. corps in the Red River expedition of Gen. N. P. Banks, and received the brevet of colonel for his services at the action of Pleasant Hill. In May 1864 he became lieutenant-colonel U.S.A. and major-general U.S.V., and during the greater part of the year was employed in Missouri against the Confederate general Sterling Price. Thence he was summoned to join forces with G. H. Thomas at Nashville, then threatened by the advance of Gen. J. B. Hood. He bore a conspicuous share in the crowning victory of Nashville (*q.v.*), after which he commanded the XVI. corps in the final campaign in the South. Just before the close of the war he was breveted brigadier-general U.S.A. for his services at the action of Tupelo, Mississippi, and major-general U.S.A. for Nashville. He resigned his volunteer commission in 1866 and became colonel of the 7th U.S. Cavalry. In 1869, however, he resigned in order to become postmaster of St Louis, where he died on the 30th of January 1897.

SMITH, CHARLES EMORY (1842–1908), American journalist and political leader, was born in Mansfield, Connecticut, on the 18th of February 1842. In 1849 his family removed to Albany, New York, where he attended the public schools and the Albany Academy. He graduated at Union College in 1861, was a recruiting officer on the staff of General John F. Rathbone (1819–1901) in 1861–1862, taught in the Albany Academy in 1862–1865, and was editor of the Albany *Express* in 1865–1870; joined the staff of the Albany *Journal* in 1870, and was editor-in-chief of this paper from 1876 to 1880. In 1879–1880 he was a regent of the University of the State of New York. From 1880 until his death he was editor and part proprietor of the Philadelphia *Press*. He was active as a Republican in state and national politics; was chairman of the Committee on Resolutions of the New York State Republican Conventions from 1874 to 1880 (excepting 1877), and was president of the convention of 1879; and was a delegate to several National Republican Conventions, drafting much of the Republican platforms of 1876 and 1896. In 1890–1892 he was United States minister to Russia, and during that period had charge of distributing among the Russian famine sufferers more than $100,000 in money, and five shiploads of food. He was postmaster-general in the cabinet of Presidents McKinley and Roosevelt from April 1898 until January 1902, and did much to develop the rural free delivery system. He died in Philadelphia on the 19th of January 1908.

SMITH, CHARLES FERGUSON (1807–1862), American soldier, graduated from West Point Academy in 1825, and a few years later became an instructor there, rising eventually to be commandant. As a battalion commander he distinguished himself at the Mexican War, at Palo Alto, Resaca, Monterey and Churubusco. He commanded the Red River expedition of 1856, and served under Albert Sidney Johnston in Utah (1857–1860). On the outbreak of the Civil War in 1861 he accepted a commission as brigadier-general of Union volunteers, and found himself under the command of Grant, who had been his pupil at West Point. This difficult situation was made easy by Smith's loyalty to his young chief, and the old soldier led his division of raw volunteers with success at Fort Donelson. His ripe experience, dignity, and unselfish character made him Grant's mainstay in the early days. He went up the Tennessee with the first expedition, but at Savannah, Tennessee, met with a serious accident. His senior brigadier led his division at the battle of Shiloh and he died on April 25, 1862. The early close of his career in high command deprived the Union army of one of its best leaders, and his absence was nowhere more felt than on the battlefield of Shiloh, where the Federals paid heavily for the inexperience of their generals. A month before his death he had been made major-general of volunteers.

SMITH, CHARLOTTE (1749–1806), English novelist and poet, eldest daughter of Nicholas Turner of Stoke House, Surrey, was born in London on the 4th of May 1749. She left school when she was twelve years old to enter society. She married in 1765 Benjamin Smith, son of a merchant who was a director of the East India Company. They lived at first with her father-in-law, who thought highly of her business abilities, and wished to keep her with him; but in 1774 Charlotte and her husband went to live in Hampshire. The elder Smith died in 1776, leaving a complicated will, and six years later Benjamin Smith was imprisoned for debt. Charlotte Smith's first publication was *Elegiac Sonnets* *and other Essays* (1784), dedicated by permission to William Hayley, and printed at her own expense. For some months Mrs Smith and her family lived in a tumble-down château near Dieppe, where she produced a translation of *Manon Lescaut* (1785) and a *Romance of Real Life* (1786), borrowed from *Les Causes Célèbres*. On her return to England Mrs Smith carried out a friendly separation between herself and her husband, and thenceforward devoted herself to novel writing. Her chief works are:—*Emmeline, or the Orphan of the Castle* (1788); *Celestina* (1792); *Desmond* (1792); *The Old Manor House* (1793); *The Young Philosopher* (1798); and *Conversations introducing Poetry* (1804). She died at Tilford, near Farnham, Surrey, on the 28th of October 1806. She had twelve children, one of whom, Lionel (1778–1842), rose to the rank of lieutenant-general in the army. He became K.C.B. in 1832 and from 1833 to 1839 was governor of the Windward and Leeward Islands.

Charlotte Smith's novels were highly praised by her contemporaries and are still noticeable for their ease and grace of style. Hayley said that *Emmeline*, considering the situation of the author, was the most wonderful production he had ever seen, and not inferior to any book in that fascinating species of composition (Nichols, *Illustrations of Literature*, vii. 708). The best account of Mrs Smith is by Sir Walter Scott, and is based on material supplied by her sister, Mrs Dorset, with a detailed criticism of her work by Scott (*Misc. Prose Works*, 1841, i. 348-359). Charlotte Smith is best remembered by her charming poems for children.

SMITH, COLVIN (1795–1875), Scottish portrait-painter, was born at Brechin, Scotland, in 1795. He studied in London in the schools of the Royal Academy and worked in Nollekens's studio. He then proceeded to Italy, where he executed some fine copies from Titian; and at Antwerp he made studies from the works of Rubens. Returning to Scotland in 1827, he settled in Edinburgh, occupying the house and studio which had formerly belonged to Raeburn. Soon he attained a wide practice as a portrait-painter, and among his sitters were Lord Jeffrey, Henry Mackenzie, author of *The Man of Feeling*, and many of the most celebrated Scotsmen of the time. His portrait of Sir Walter Scott was so popular that he executed some twenty replicas of it, for seven of which he received fresh sittings. His works are distinguished by excellent draftsmanship, by directness and simplicity of treatment, and by well-marked individuality. He died in Edinburgh on the 21st of July 1875.

SMITH, EDMUND KIRBY (1824–1893), Confederate general in the American Civil War, was the son of Joseph Lee Smith (1776–1846), an American lawyer and soldier, who served with credit in the War of 1812 and rose to the rank of colonel U.S.A. His elder brother, Ephraim Kirby Smith (1807–1847), also a soldier, fell at Molino del Rey; and Joseph Lee Kirby Smith, Ephraim's son, who took the Federal side in the Civil War, was mortally wounded at the battle of Corinth, having at the age of twenty-six attained the rank of brevet-colonel U.S.A. Edmund Kirby Smith was born at St Augustine, Fla., on the 16th of May 1824, and graduated at West Point in 1845, being assigned to the infantry. In the Mexican War he was breveted first lieutenant, and captain for gallantry at Vera Cruz and Cerro Gordo and at Contreras-Churubusco. He was assistant professor of mathematics at West Point from 1849 to 1852 and was later engaged in Indian warfare on the Texas frontier. In 1861 he attained the rank of major. When Florida seceded he resigned his army commission and entered the Confederate service as a lieutenant-colonel. He was made a brigadier-general on the 17th of June 1861, and was wounded at the battle of Bull Run (*q.v.*). In command of the Confederate forces in the Cumberland Gap region Kirby Smith took part in General Bragg's invasion of Kentucky in the autumn of 1862, and inflicted upon the Federal forces a severe defeat at Richmond, Ky., on the 30th of August; and was present at the battles of Perryville and Murfreesboro (Stone River). From February 1863 to the fall of the Confederacy he was in command of the trans-Mississippi department, and was successful in making this section of the Confederacy (isolated from the rest by the fall of Vicksburg) self-supporting. He instituted a regular system of blockade-running, and met and defeated the Red River expedition under General N. P. Banks in 1864. Kirby Smith and his troops surrendered on the 26th of May 1865, being the last armed forces of the Confederate States to do so. After the war, he was from 1866 to 1868 president of the Atlantic and Pacific Telegraph company, from 1868 to 1870 president of the Western Military Academy, from 1870 to 1875 chancellor of the university of Nashville, and from 1875 to his death professor of mathematics at the university of the South, Sewanee, Tennessee. He died at Sewanee on the 28th of March 1893.

SMITH, FRANCIS HOPKINSON (1838–), American author, artist and engineer, was born in Baltimore, Maryland, on the 23rd of October 1838, a descendant of Francis Hopkinson, one of the signers of the Declaration of Independence. He became a contractor in New York City and did much work for the Federal government, including the stone ice-breaker at Bridgeport, Connecticut, the jetties at the mouth of the Connecticut river, the foundation for the Bartholdi Statue of Liberty in New York harbour, the Race Rock Lighthouse off New London, Conn., and many life-saving stations. His vacations were spent sketching in the White Mountains, in Cuba, in Mexico, and afterwards in Venice, Constantinople and Holland. He published various volumes of travel, illustrated by himself; they include *Old Lines in New Black and White* (1885); *Well-Worn Roads* (1886); *A White Umbrella in Mexico* (1889); *Gondola Days* (1897), and *The Venice of To-Day* (1897). His novels and short stories are especially felicitous in their portrayal of the Old South. Among them are: *Col. Carter of Cartersville* (1891), which was successfully dramatized; *A Day at La Guerre's and other Days* (1892); *A Gentleman Vagabond* (1895); *Tom Grogan* (1896); *Caleb West, Master-Diver* (1898); *The Other Fellow* (1899); *The Fortunes of Oliver Horn* (1902), which has reminiscences of his artist friends; *Col. Carter's Christmas* (1904); *At Close Range* (1905); *The Tides of Barnegat* (1906); *The Veiled Lady* (1907); *The Romance of an Old Fashioned Gentleman* (1907); *Peter* (1908); and *Forty Minutes Late and Other Stories* (1909).

SMITH, GEORGE (1789–1846), British publisher, founder of the firm of Smith, Elder & Co., was born in Scotland in 1789. From Elgin, where he was apprenticed to a bookseller, he migrated to London, where he found employment first with Rivingtons, and afterwards with John Murray. In 1816 Smith and another Scot, Alexander Elder, began business at 158 Fenchurch Street as booksellers and stationers; and in 1819 they became publishers also. It was here that GEORGE SMITH (2) (1824–1901), the most famous member of the firm, was born on the 19th of March 1824; and in the same year the business was removed to 65 Cornhill. At the age of fourteen George Smith (2) came into the business, and in 1843 he took over the control of the publishing department. On his father's death in 1846 the responsibility of the business devolved principally upon him, and under his management it increased thirteen times in twenty years. A large portion of the business was connected with foreign agencies and banking, especially with India, but this was relinquished in 1868 to his partner Henry S. King, who now separated from the firm, retaining the old premises at Cornhill, while Smith removed the publishing business, now under his sole control, to 15 Waterloo Place. For over thirty years Smith was the friend and publisher of Ruskin, and it was with him that *Jane Eyre* found a publisher. In 1855 was started the *Overland Mail*, a weekly periodical for Indian readers, and the *Homeward Mail*, containing Indian news for English readers. By Smith, Elder & Co. were issued works by Darwin, Ruskin, Thackeray, Robert and Mrs Browning, Wilkie Collins, Matthew Arnold, Miss Martineau, James Payn and Mrs Humphry Ward. In 1866 was published Trollope's *Last Chronicles of Barset*, for which £3000 was paid. In January 1860 the first of George Smith's three great undertakings was begun, the *Cornhill Magazine* being issued in that month under the editorship of Thackeray. The second venture was the founding in 1865 of the *Pall Mall Gazette* (see NEWSPAPERS). The third and most important was the publication of the *Dictionary of National Biography*, the first volume of which was issued in 1882; it was completed in 1901, in 66 volumes; and this monumental work was the crowning effort of a successful career. Smith was a rich man, not only from his publishing business, but on account of his large ownership in the mineral water Apollinaris and other ventures. His second son, Alexander Murray Smith, joined the firm in 1890, and with him was associated in 1894 his brother-in-law Reginald J. Smith, who in 1899 became acting partner. George Smith himself died at Byfleet, near Weybridge, on the 6th of April 1901.

See the memoir (1901) of George Smith (2) prefixed to vol. i. of the supplement to the *Dictionary of National Biography*; reminiscences contributed to the *Cornhill Magazine* (Nov. 1900–Feb. 1901) by George Smith; an article by Sir Leslie Stephen in the same magazine (May 1901); and the special number of the *Cornhill* in January 1910, published on its 50th anniversary.

SMITH, GEORGE [" George Smith of Coalville "] (1831–1895), English philanthropist, was born near Tunstall, Staffordshire, on the 16th of February 1831. His father was a brickmaker, and when nine years old George Smith was working thirteen hours a day in the brickfields. Nevertheless he contrived to obtain some education, so that in time he improved his position, becoming manager of a brick and tile works. In 1857 he discovered, at Coalville, Leicestershire, valuable seams of clay, and on the strength of this discovery organized a large brick-making business there. He advocated legislation in the interests of brickmakers, and in particular called attention to the cruelty suffered in the brickfields by child-workers, whose claims he pressed at the Social Science congresses. In 1871 he published *The Cry of the Children*. This work awoke the interest of the (seventh) earl of Shaftesbury and of A. J. Mundella, and, in the same year, was passed an act providing for the government inspection of brick-yards, and the regulation of juvenile and female labour there. Smith's share in this act aroused great antagonism, and at the end of 1872 he was dismissed from his position at Coalville, and reduced to great poverty. Nevertheless he turned his attention to the conditions of life of the hundred thousand persons living on canals. As the result of his representations on the subject the Canal Boats Bill was introduced by Mr Sclater-Booth (afterwards Lord Basing). This bill, which came into force in 1878, provided for the education of children on canal boats, and regulated the sanitary condition of life on board. In 1884 was passed another bill strengthening the provisions of the first. From that date onwards Smith devoted his attention to improving the condition of Gipsy children which he had described in his *Gipsy Life* (1880). A Moveable Dwellings Bill embodying his views was several times introduced into parliament, but always defeated. In 1885 Smith received a grant from the royal bounty fund. He died at Crick near Rugby on the 21st of June 1895.

See *George Smith of Coalville, the Story of an Enthusiast*, by E. Hodder (1896).

SMITH, GEORGE (1840–1876), English Assyriologist, was born on the 26th of March 1840 at Chelsea, London. His father was a working man, and at fourteen the boy was apprenticed to Messrs Bradbury and Evans to learn bank-note engraving. He had already shown a keen interest in the explorations of Layard and Rawlinson, and during the next few years he devoted all his spare time to studying the cuneiform inscriptions at the British Museum. His earnestness attracted the attention of Sir Henry Rawlinson, who permitted him the use of his room at the museum and placed the many casts and squeezes of the inscriptions at his disposal. Smith was thus enabled to make his first discovery (the date of the payment of the tribute by Jehu to Shalmanezer). and Sir Henry suggested to the trustees of the Museum that he should be associated with himself in the preparation of the third volume of *Cuneiform Inscriptions of Western Asia*. Accordingly, in 1867, Smith was appointed assistant in the Assyriology department, and the earliest of his successes was the discovery of two inscriptions, one fixing the date of the total eclipse of the sun in the month Sivan in May 763 B.C., and the other the date of an invasion of Babylonia by the Elamites in 2280 B.C. In 1871 he published *Annals of Assur-bani-pal*, transliterated and translated, and communicated to the newly-founded Society of Biblical Archaeology a paper on " The Early History of Babylonia," and an account of his decipherment of the Cypriote inscriptions. In 1872 Smith achieved world-wide fame by his translation of the Chaldaean account of the Deluge, which was read before the Society of Biblical Archaeology on the 3rd of December. In the following January Sir Edwin Arnold, the editor of the *Daily Telegraph*, arranged with Smith that he should go to Nineveh at the expense of that journal, and carry out excavations with a view to finding the missing fragments of the Deluge story. This journey resulted not only in the discovery of the missing tablets, but of fragments which recorded the succession and duration of the Babylonian dynasties. In 1874 Smith again left England for Nineveh, this time at the expense of the Museum, and continued his excavations at Kouyunjik. An account of his work is given in *Assyrian Discoveries*, published early in 1875. The rest of the year was spent in fixing together and translating the fragments relating to the Creation, the results of which work were embodied in *The Chaldaean Account of Genesis*. In March 1876 the trustees of the British Museum despatched Smith once more to excavate the rest of Assur-bani-pal's library. At Ikisji, a small village about 60 m. N.E. of Aleppo, he was prostrated by fever, and finally died at Aleppo on the 19th of August. He left a wife and children, on whose behalf a public subscription was made.

SMITH, GEORGE ADAM (1856–   ), Scottish divine, was born in Calcutta on the 19th of October 1856, where his father, George Smith, C.I.E., was then principal of the Doveton College. He was educated at Edinburgh in the Royal High School, the University and New College. After studying at Tübingen and Leipzig and travelling in Egypt and Syria, he entered the ministry of the Free Church of Scotland and was appointed professor of Old Testament subjects in the Free Church College at Glasgow 1892. In 1909 he was appointed principal of the University of Aberdeen.

Among his works are *The Book of Isaiah* (2 vols., 1888–1890); *The Book of the Twelve Prophets* (2 vols., 1876–1877); *Historical Geography of the Holy Land* (1894); *Jerusalem* (2 vols., 1907); *The Preaching of the Old Testament to the Age* (1893); *The Life of Henry Drummond* (1898).

SMITH, GERRIT (1797–1874), American reformer and philanthropist, was born in Utica, New York, on the 6th of March 1797. After graduating at Hamilton College in 1818, he assumed the management of the vast estate of his father, Peter Smith (1768–1837), long a partner of John Jacob Astor, and greatly increased the family fortune. About 1828 he became an active worker in the cause of temperance, and in his home village, Peterboro, he built one of the first temperance hotels in the country. He became an abolitionist in 1835, after seeing an anti-slavery meeting at Utica broken up by a mob. In 1840 he took a leading part in the organization of the Liberty party, and in 1848 and 1852 he was nominated for the presidency by the remnant of this organization that had not been absorbed by the Free Soil party. An " Industrial Congress " at Philadelphia also nominated him for the presidency in 1848, and the " Land Reformers " in 1856. In 1840 and in 1858 he was a candidate for the governorship of New York on an anti-slavery platform. In 1853 he was elected to the National House of Representatives as an independent, and issued an address declaring that all men have an equal right to the soil; that wars are brutal and unnecessary; that slavery could be sanctioned by no constitution, state or federal; that free trade is essential to human brotherhood; that women should have full political rights; that the Federal government and the states should prohibit the liquor traffic within their respective jurisdictions; and that government officers, so far as practicable, should be elected by direct vote of the people. At the end of the first session he resigned his seat. After becoming an opponent of land monopoly, he gave numerous farms of fifty acres each to indigent families, and also attempted to colonize tracts in N. New York with free negroes; but this experiment was a failure. Peterboro became a station on the " underground railroad "; and after 1850 Smith furnished money for the legal expenses of persons charged with infractions of the Fugitive Slave Law. With John Brown, to whom he gave a farm in Essex county, New York, he became very intimate, and from time to time supplied him with funds, though it seems without knowing that any of the money would be employed in an attempt to incite a slave insurrection. Under the excitement following the raid on Harper's Ferry he became temporarily insane, and for several weeks was confined in an asylum in Utica. He favoured a vigorous prosecution of the Civil War, but at its close advocated a mild policy toward the late Confederate states, declaring that part of the guilt of slavery lay upon the North. He even became one of the securities for Jefferson Davis, thereby incurring the resentment of Northern radical leaders.

In religion as in politics Gerrit Smith was a radical. Believing that sectarianism was sinful, he separated from the Presbyterian Church in 1843, and was one of the founders of the Church at Peterboro, a non-sectarian institution open to all Christians of whatever shade of belief. His private benefactions were boundless; of his gifts he kept no record, but their value is said to have exceeded $8,000,000. Though a man of great wealth his life was one of marked simplicity. He died on the 28th of December 1874, while on a visit to relatives in New York City.

See O. B. Frothingham, *Gerrit Smith: a Biography* (New York, 1879).

SMITH, GOLDWIN (1823–1910), British historian and publicist, was born at Reading on the 13th of August 1823. He was educated at Eton and Magdalen College, Oxford, and after an undergraduate career of exceptional brilliancy was elected to a fellowship at University College. He threw his keen intellect and trenchant style into the cause of university reform, the leading champion of which was another fellow of University College, Arthur Penrhyn Stanley. On the Royal Commission of 1850 to inquire into the reform of the university, of which Stanley was secretary, he served as assistant-secretary; and he was secretary to the commissioners appointed by the act of 1854. His position as an authority on educational reform was further recognized by a seat on the Popular Education Commission of 1858. In 1868, when the question of reform at Oxford was again growing acute, he published a brilliant pamphlet, entitled *The Reorganization of the University of Oxford*. Besides the abolition of tests, effected by the act of 1871, many of the reforms there suggested, such as the revival of the faculties, the reorganization of the professoriate, the abolition of celibacy as a condition of the tenure of fellowships, and the combination of the colleges for lecturing purposes, were incorporated in the act of 1877, or subsequently adopted by the university. He gave the counsel of perfection that "pass" examinations ought to cease; but he recognized that this change "must wait on the reorganization of the educational institutions immediately below the university, at which a passman ought to finish his career." His aspiration that colonists and Americans should be attracted to Oxford has been realized by Mr Rhodes's will. On what is perhaps the vital problem of modern education, the question of ancient *versus* modern languages, he pronounced that the latter "are indispensable accomplishments, but they do not form a high mental training"—an opinion entitled to peculiar respect as coming from a president of the Modern Language Association. The same conspicuous openness of mind appears in his judgment, delivered after he had held the regius professorship of Modern History at Oxford from 1858 to 1866, that "ancient history, besides the still unequalled excellence of the writers, is the best instrument for cultivating the historical sense." As a historian, indeed, he left no abiding work; the multiplicity of his interests prevented him from concentrating on any one subject. His chief historical writings—*The United Kingdom: a Political History* (1899), and *The United States: an Outline of Political History* (1893)—though based on thorough familiarity with their subject, make no claim to original research, but are remarkable examples of terse and brilliant narrative.

The outbreak of the American Civil War proved a turning-point in his life. Unlike most men of the ruling classes in England, he warmly championed the cause of the North, and his pamphlets, especially one entitled *Does the Bible sanction American Slavery?* (1863), played a prominent part in converting English opinion. Visiting America on a lecture tour in 1864, he received an enthusiastic welcome, and was entertained at a public banquet in New York. In 1868 he threw up his career in England and settled in the United States, where he held the professorship of English and Constitutional History at Cornell University till 1871. In that year he removed to Toronto, where he edited the *Canadian Monthly*, and subsequently founded the *Week* and the *Bystander*. He did not, however, cease to take an active interest in English politics. He had been a strong supporter of Irish Disestablishment, but he refused to follow Gladstone in accepting Home Rule. He expressly stated that "if he ever had a political leader, his leader was John Bright, not Mr Gladstone." Speaking in 1886, he referred to his "standing by the side of John Bright against the dismemberment of the great Anglo-Saxon community of the West, as I now stand against the dismemberment of the great Anglo-Saxon community of the East." These words form the key to his views of the future of the British Empire. He always maintained that Canada, separated by great barriers, running north and south, into four zones, each having unimpeded communication with the adjoining portions of the United States, was destined by its natural configuration to enter into a commercial union with them, which would result in her breaking away from the British empire, and in the union of the Anglo-Saxons of the American continent into one great nation. These views are most fully stated in his *Canada and the Canadian Question* (1891). Though describing himself as "anti-Imperialistic to the core," he was yet deeply penetrated with a sense of the greatness of the British race. Of the British empire in India he said that "it is the noblest the world has seen. . . . Never had there been such an attempt to make conquest the servant of civilization. About keeping India there is no question. England has a real duty there." His fear was that England would become a nation of factory-workers, thinking more of their trade-union than of their country. These forebodings were intensified in his *Commonwealth or Empire?* (1902)—a warning to the United States against the assumption of imperial responsibilities. Among other causes that he powerfully attacked were liquor prohibition, female suffrage and State Socialism. All these are discussed in his *Essays on Questions of the Day* (revised edition, 1894). He also published sympathetic monographs on *Cowper* and *Jane Austen*, and attempted verse in *Bay Leaves* and *Specimens of Greek Tragedy*. In his *Guesses at the Riddle of Existence* (1897), he abandons the faith in Christianity expressed in his lecture of 1861 on Historical Progress (where he forecast the speedy reunion of Christendom on the "basis of free conviction"), and writes in a spirit "not of Agnosticism, if Agnosticism imports despair of spiritual truth, but of free and hopeful inquiry, the way for which it is necessary to clear by removing the wreck of that upon which we can found our faith no more." In his later years he expressed his views in a weekly journal *The Farmer's Sun*, and published in 1904 *My Memory of Gladstone*, while occasional letters to the *Spectator* showed that he had lost neither his interest in English politics and social questions nor his remarkable gifts of style. He died at his residence, The Grange, Toronto, on the 7th of June 1910.

Goldwin Smith left in manuscript a book of reminiscences, which was edited by Mr Arnold Haultain, his private secretary.

SMITH, HENRY BOYNTON (1815–1877), American theologian, was born in Portland, Maine, on the 21st of November 1815. He graduated at Bowdoin College in 1834; studied theology at Andover, where his health failed, at Bangor, and, after a year (1836–1837) as librarian and tutor in Greek at Bowdoin, in Germany at Halle, where he became personally intimate with Tholuck and Ulrici, and in Berlin, under Neander and Hengstenberg. He returned to America in 1840, was a tutor for a few months (1840–1841) at Bowdoin, and in 1842, shut out from any better place by distrust of his German training and by his frank opposition to Unitarianism, he became pastor of the Congregational Church of West Amesbury (now Merrimac), Massachusetts. In 1847–1850 he was professor of moral philosophy and metaphysics at Amherst; and in 1850–1854 was Washburn professor of Church history, and in 1854–1874 Roosevelt professor of systematic theology, at Union Theological

Seminary. His health failed in 1874 and he died in New York City on the 7th of February 1877. Of the old school of the "New England Theology," Smith was one of the foremost leaders of the new school Presbyterians. His theology is most strikingly contained in the Andover address, "Relations of Faith and Philosophy," which was delivered before the Porter Rhetorical Society in 1849. He always made it clear that the ideal philosophy was Christocentric: he said that Reformed theology must "'Christologize' predestination and decrees, regeneration and sanctification, the doctrine of the Church, and the whole of the Eschatology."

His son HENRY GOODWIN SMITH (b. 1860) was pastor of the Freehold (New Jersey) Presbyterian Church in 1886–1896, and from 1897 to 1903 was professor of systematic theology in Lane Theological Seminary.

From notes of his lectures, William S. Karr prepared two volumes of Dr Smith's theological writings, *Introduction to Christian Theology* (1883) and *System of Christian Theology* (1884). Dr Smith contributed articles on Calvin, Kant, Pantheism, Miracles, Reformed Churches, Schelling and Hegel to the *American Cyclopaedia*, and contributed to McClintock and Strong's *Cyclopaedia*; and was editor of the *American Theological Review* (1859 sqq.), both in its original form and after it became the *American Presbyterian and Theological Review* and, later, the *Presbyterian Quarterly and Princeton Review*.

See E. L. (Mrs H. B.) Smith, *Henry Boynton Smith, His Life and Works* (New York, 1881), and Lewis F. Stearns, *Henry Boynton Smith* (Boston, 1892), in the American Religious Leaders series.

SMITH, SIR HENRY GEORGE WAKELYN, Bart. (1787–1860), British general, son of John Smith, surgeon, of Whittlesey, Cambridgeshire, was born at that place on the 28th of June 1787. Harry Smith—for throughout life he adopted the more familiar form of his Christian name—was educated privately and entered the army in 1805. His first active service was in South America in 1806, and he subsequently served through the Peninsular War from the concentration at Salamanca in November 1808 to the battle of Toulouse on the 10th of April 1814. On the day following the storming of Badajos (the 6th of April 1812) a well-born Spanish lady, whose entire property in the city had been destroyed, presented herself at the British lines seeking protection from the licence of the soldiery for herself and her sister, a child of fourteen, by whom she was accompanied. The latter, whose name was Juana Maria de Los Dolores de Leon, had but recently emerged from a convent; but notwithstanding her years she was married to Harry Smith a few days later. She remained with him throughout the rest of the war, accompanying the baggage train, sleeping in the open on the field of battle, riding freely among the troops, and sharing all the privations of campaigning. Her beauty, courage, sound judgment and amiable character endeared her to the officers, including the duke of Wellington, who spoke of her familiarly as Juanita; and she was idolized by the soldiers. At the close of the war Harry Smith volunteered for service in the United States, where he was present at the battle of Bladensburg (the 24th of August 1814), and witnessed the burning of the capitol at Washington; which, as he said, "horrified us coming fresh from the duke's humane warfare in the south of France." Returning to Europe he was brigade-major at Waterloo; and in 1828 was ordered to the Cape of Good Hope, where he commanded a division in the Kaffir War of 1834–36. In 1835 he accomplished the feat of riding from Cape Town to Graham's Town, a distance of 600 m., in less than six days; and having restored confidence among the whites by his energetic measures, he was appointed governor of the new Province of Queen Adelaide, where he gained unbounded influence over the native tribes, whom he vigorously set himself to civilize and benefit. But though supported by Sir Benjamin D'Urban, the high commissioner, the ministry in London reversed his policy and—to quote Smith's own words—"directed the Province of Queen Adelaide to be restored to barbarism." Smith himself was removed from his command, his departure being deplored alike by the Kaffirs and the Dutch; and numbers of the latter, largely in consequence of this policy of Lord Glenelg, began the migration to the interior known as "the great trek."

Harry Smith was now appointed deputy-adjutant-general of the forces in India, where he took part in the Gwalior campaign of 1843 (for which he received a K.C.B.) and the Sikh War of 1845–46. He was in command of a division under Sir Hugh Gough at the battles of Moodkee and Ferozeshah, where he conspicuously distinguished himself, but was insufficiently supported by the commander-in-chief. After the second of these actions Sir Harry Smith was appointed to an independent command, and on the 28th of January 1846 he inflicted a crushing defeat on the Sikhs at Aliwal on the Sutlej. At Sobraon on the 10th of February he again commanded a division under Gough. For the great victory of Aliwal he was awarded the thanks of parliament; and the speech of the duke of Wellington was perhaps the warmest encomium ever bestowed by that great commander on a meritorious officer. Sir Harry was at the same time created a baronet; and as a special distinction the words "of Aliwal" were by the patent appended to the title. In 1847 he returned to South Africa as governor of Cape Colony and high commissioner, to grapple with the difficulties he had foreseen eleven years before (see CAPE COLONY: *History*). He took command of an expedition to deal with the disaffected Boers in the Orange River Sovereignty, and fought the action of Boomplaats on the 29th of August 1848. In December 1850 war broke out with the Kaffirs; Sir Harry Smith was insufficiently supplied with troops from England; and though his conduct of the operations was warmly approved by the duke of Wellington and other military authorities, Lord Grey, in a despatch never submitted to the queen, recalled him in 1852 before the Kaffirs had been completely subdued. He protested strongly against the abandonment of the Orange River Sovereignty to the Boers, which was carried out two years after his departure, and he actively furthered the granting of responsible government to Cape Colony. His Spanish wife was his constant companion in his second as in his earlier sojourn in South Africa, where her memory is recalled by the town of Ladysmith in Natal (rendered famous by the Boer War of 1899–1902), as is that of her husband by Harrismith in the Orange Free State; while Aliwal North, founded in 1849 and named after his great Indian victory, further commemorates Sir Harry Smith. On his return to England he held a military appointment for some years, and died in London on the 12th of October 1860. Juana, Lady Smith, survived till 1872.

See *Autobiography of Sir Harry Smith*, edited by G. C. Moore Smith (1901); R. S. Rait, *Life of Viscount Gough* (1903); Wilmot and Chase, *Annals of the Cape Colony* (1869); J. Noble, *South Africa* (1877); Theal's *History of South Africa*, vol. iv. (R. J. M.)

SMITH, HENRY JOHN STEPHEN (1826–1883), English mathematician, was born in Dublin on the 2nd of November 1826, and was the fourth child of his parents. When Henry Smith was just two years old his father died, whereupon his mother left Ireland for England. After being privately educated by his mother and tutors, he entered Rugby school in 1841. Whilst under the first of these tutors, in nine months he read all Thucydides, Sophocles and Sallust, twelve books of Tacitus, the greater part of Horace, Juvenal, Persius, and several plays of Aeschylus and Euripides. He also studied the first six books of Euclid and some algebra, besides reading a considerable quantity of Hebrew and learning the *Odes* of Horace by heart. On the death of his elder brother in September 1843 Henry Smith left Rugby, and at the end of 1844 gained a scholarship at Balliol College, Oxford. He won the Ireland scholarship in 1848 and obtained a first class in both the classical and the mathematical schools in 1849. He gained the senior mathematical scholarship in 1851. He was elected fellow of Balliol in 1850 and Savilian professor of geometry in 1861, and in 1874 was appointed keeper of the university museum. He was elected F.R.S. in 1861, and was an LL.D. of Cambridge and Dublin. He served on various royal commissions, and from 1877 was the chairman of the managing body of the meteorological office. He died at Oxford on the 9th of February 1883.

After taking his degree he wavered between classics and mathematics, but finally chose the latter. After publishing a few short papers relating to theory of numbers and to geometry, he devoted himself to a thorough examination of the writings of K. F. Gauss,

P. G. Lejeune-Dirichlet, E. E. Kummer, &c., on the theory of numbers. The main results of these researches, which occupied him from 1854 to 1864, are contained in his *Report on the Theory of Numbers*, which appeared in the British Association volumes from 1859 to 1865. This report contains not only a complete account of all that had been done on this vast and intricate subject but also original contributions of his own. Some of the most important results of his discoveries were communicated to the Royal Society in two memoirs upon "Systems of Linear Indeterminate Equations and Congruences" and upon the "Orders and Genera of Ternary Quadratic Forms" (*Phil. Trans.*, 1861 and 1867). He did not, however, confine himself to the consideration of forms involving only three indeterminates, but succeeded in establishing the principles on which the extension to the general case of *n* indeterminates depends, and obtained the general formulae, thus effecting what is probably the greatest advance made in the subject since the publication of Gauss's *Disquisitiones arithmeticae*. A brief abstract of Smith's methods and results appeared in the *Proc. Roy. Soc.* for 1864 and 1868. In the second of these notices he gives the general formulae without demonstrations. As corollaries to the general formulae he adds the formulae relating to the representation of a number as a sum of five squares and also of seven squares. This class of representation ceases when the number of squares exceeds eight. The cases of two, four and six squares had been given by K. G. J. Jacobi and that of three squares by F. G. Eisenstein, who had also given without demonstration some of the results for five squares. Fourteen years later the Académie Française, in ignorance of Smith's work, set the demonstration and completion of Eisenstein's theorems for five squares as the subject of their "Grand Prix des Sciences Mathématiques." Smith, at the request of a member of the commission by which the prize was proposed, undertook in 1882 to write out the demonstration of his general theorems so far as was required to prove the results for the special case of five squares. A month after his death, in March 1883, the prize of 3000 francs was awarded to him. The fact that a question of which Smith had given the solution in 1867, as a corollary from general formulae governing the whole class of investigations to which it belonged, should have been set by the Académie as the subject of their great prize shows how far in advance of his contemporaries his early researches had carried him. Many of the propositions contained in his dissertation are general; but the demonstrations are not supplied for the case of seven squares. He was also the author of important papers in which he extended to complex quadratic forms many of Gauss's investigations relating to real quadratic forms. After 1864 he devoted himself chiefly to elliptic functions, and numerous papers on this subject were published by him in the *Proc. Lond. Math. Soc.* and elsewhere. At the time of his death he was engaged upon a memoir on the *Theta and Omega Functions*, which he left nearly complete. In 1868 he was awarded the Steiner prize of the Berlin Academy for a geometrical memoir, *Sur quelques problèmes cubiques et biquadratiques*. He also wrote the introduction to the collected edition of Clifford's *Mathematical Papers* (1882). The three subjects to which Smith's writings relate are theory of numbers, elliptic functions and modern geometry; but in all that he wrote an "arithmetical" mode of thought is apparent, his methods and processes being arithmetical as distinguished from algebraic. He had the most intense admiration of Gauss. He was president of the mathematical and physical section of the British Association at Bradford in 1873 and of the London Mathematical Society in 1874–1876. His *Collected Papers* were edited by J. W. L. Glaisher and published in 1894.

An article in the *Spectator* of the 17th of February 1883, by Lord Justice Bowen, gives perhaps the best idea of Smith's extraordinary personal qualities and influence. See also J. W. L. Glaisher's memoir in the *Monthly Notices of the Roy. Ast. Soc.* (vol. xliv., 1884).

SMITH, HENRY PRESERVED (1847–), American Biblical scholar, was born in Troy, Ohio, on the 23rd of October 1847. He graduated at Amherst College in 1869 and studied theology in Lane Theological Seminary in 1869–1872, in Berlin in 1872–1874 and in Leipzig in 1876–1877. He was instructor in church history in 1874–1875, and in Hebrew in 1875–1876, and was assistant-professor in 1877–1879 and professor in 1879–1893 of Hebrew and Old Testament exegesis in Lane Theological Seminary. In 1892 he was tried for heresy by the Presbytery of Cincinnati, was found guilty of teaching (in a pamphlet entitled *Biblical Scholarship and Inspiration*, 1891) that there were "errors of historic fact," suppressions of "historic truths," &c., in the books of Chronicles, and that the "inspiration of the Holy Scriptures is consistent with the unprofitableness of portions of the sacred writings,"—in other words, that inspiration does not imply inerrancy,—and he was suspended from the ministry. Dr Smith retired from the denomination, and in 1893, upon becoming a professor at Andover Theological Seminary, entered the ministry of the Congregational Church. From 1897 to 1906 he was a professor in Amherst College, and in 1907 became a professor in the Meadville (Pennsylvania) Theological School.

He published *The Bible and Islam* (1897), *Commentary on the Books of Samuel* (1899, in the "International Critical Commentary") and *Old Testament History* (1903, in the "International Theological Library"). In *Inspiration and Inerrancy* (Cincinnati, 1893), he reprinted the papers on which the heresy charge was made, and outlined the case.

SMITH, JAMES (1775–1839), and **HORACE** (1779–1849), authors of the *Rejected Addresses*, sons of a London solicitor, were born, the former on 10th February 1775 and the latter on 31st December 1779, both in London. The occasion of their happy *jeu d'esprit* was the rebuilding of Drury Lane theatre in 1812, after a fire in which it had been burnt down. The managers had offered a prize of £50 for an address to be recited at the re-opening in October. Six weeks before that date the happy thought occurred to the brothers Smith of feigning that the most popular poets of the time had been among the competitors and issuing a volume of unsuccessful addresses in parody of their various styles. They divided the task between them, James taking Wordsworth, Southey, Coleridge and Crabbe, while Byron, Moore, Scott and Bowles were assigned to Horace.[1] Seven editions were called for within three months. The *Rejected Addresses* are the most widely popular parodies ever published in England, and take classical rank in literature. The brothers fairly divided the honours: the elder brother's Wordsworth is evenly balanced by the younger's Scott, and both had a hand in Byron. A striking feature is the absence of malice; none of the poets caricatured took offence, while the imitation is so clever that both Byron and Scott are recorded to have said that they could hardly believe they had not written the addresses ascribed to them. The only other undertaking of the two brothers was *Horace in London* (1813). James Smith made another hit in writing *Country Cousins*, *A Trip to Paris*, *A Trip to America*, and other lively skits for Charles Mathews who said he was "the only man who can write clever nonsense." His social reputation as a wit stood high. He was reputed one of the best of talkers in an age when the art was studied, and it was remarked that he held his own without falling into the great error of wits—sarcasm. But in his old age the irreverent *Fraser's* put him in its gallery of living portraits as a gouty and elderly but pains-taking joker. He died in London on the 24th of December 1839. After making a fortune as a stockbroker, Horace Smith followed in the wake of Scott and wrote about a score of historical novels—*Brambletye House* (1826), *Tor Hill* (1826), *Reuben Apsley* (1827), *Zillah* (1828), *The New Forest* (1829), *Walter Colyton* (1830), &c. His sketches of eccentric character are brilliant and amusing; but he was more of an essayist than a story-teller. Three volumes of *Gaieties and Gravities*, published by him in 1826, contain many witty essays both in prose and in verse, but the only single piece that has taken a permanent place is the "Address to the Mummy in Belzoni's Exhibition." In private life Horace Smith was not less popular than his brother, though less ambitious as a talker. It was of him that Shelley said: "Is it not odd that the only truly generous person I ever knew who had money enough to be generous with should be a stock-broker? He writes poetry and pastoral dramas and yet knows how to make money, and does make it, and is still generous." Horace Smith died at Tunbridge Wells on 12th July 1849.

SMITH, JOHN (1579–1631), usually distinguished as Captain John Smith, sometime president of the English colony in Virginia, was the elder son of George Smith, a well-to-do tenant-farmer on the estate of Lord Willoughby d'Eresby at Willoughby, near Alford in Lincolnshire. The life of this Virginian hero falls conveniently into five periods. The first of these, up to 1596, that of his early youth, is thus described by himself in his *Travels*: "He was born (1579) in Willoughby in Lincolnshire, and was a scholar in the two free schools of Alford and Louth.

[1] The particulars of the authorship are given in the 18th edition (1820), and in the memoir of his brother by Horace prefixed to a collection of fugitive pieces (1840). James contributed the first stanza to the imitation of Byron, but otherwise they worked independently.

His parents, dying (April 1596) when he was thirteen (or rather sixteen) years of age, left him a competent means, which he, not being capable to manage, little regarded. His mind being even then set upon brave adventures, he sold his satchel, books and all he had, intending secretly to get to sea, but that his father's death stayed him. But now the guardians of his estate more regarding it than him, he had liberty enough, though no means, to get beyond the sea. About the age of fifteen years, he was bound an apprentice to Master Thomas Sendall of [King's] Lynn, the greatest merchant of all those parts; but, because he would not presently send him to sea, he never saw his master in eight years after."

The second period, 1596–1604, is that of his adventures in Europe, Asia and Africa. He first went to Orleans in attendance on the second son of Lord Willoughby. Thence he returned to Paris, and so by Rouen to Havre, where, his money being spent, he began to learn the life of a soldier under Henry IV. of France. On the conclusion (1599) of peace with the League, he went with Captain Joseph Duxbury to Holland and served there some time, probably with the English troops in Dutch pay. By this time he had gained a wide experience in the art of war, not merely as an infantry officer, but also in those more technical studies which are now followed by the Royal Engineers. At length he sailed from Enkhuisen to Scotland, and on the voyage had a narrow escape from shipwreck upon Holy Island near Berwick. After some stay in Scotland he returned home to Willoughby, "where, within a short time being glutted with too much company, wherein he took small delight, he retired himself into a little woody pasture, a good way from any town, environed with many hundred acres of other woods. Here by a fair brook he built a pavilion of boughs, where only in his clothes he lay. His study was Machiavelli's *Art of War* and Marcus Aurelius; his exercise a good horse with his lance and ring; his food was thought to be more of venison than anything else; what [else] he wanted his man brought him. The country wondering at such a hermit, his friends persuaded one Signior Theadora Polaloga, rider to Henry, earl of Lincoln, an excellent horseman and a noble Italian gentleman, to insinuate [himself] into his woodish acquaintances, whose languages and good discourse and exercise of riding drew Smith to stay with him at Tattersall. . . . Thus—when France and the Netherlands had taught him to ride a horse and use his arms, with such rudiments of war as his tender years, in those martial schools, could attain unto, he was desirous to see more of the world, and try his fortune against the Turks, both lamenting and repenting to have seen so many Christians slaughter one another."

Next came his wanderings through France from Picardy to Marseilles. There he took ship for Italy in a vessel full of pilgrims going to Rome. These, cursing him for a heretic, and swearing they would have no fair weather so long as he was on board, threw him, like another Jonah, into the sea. He was able to get to a little uninhabited island, from which he was taken off the next morning by a Breton ship of 200 tons going to Alexandria, the captain of which, named La Roche, treated him as a friend. In this ship he visited Egypt and the Levant. On its way back the Breton ship fought a Venetian argosy of 400 tons and captured it. Reaching Antibes (Var) later on, Captain La Roche put Smith ashore with 500 sequins, who then proceeded to see Italy as he had already seen France. Passing through Tuscany he came to Rome, where he saw Pope Clement VIII. at mass, and called on Father R. Parsons. Wandering on to Naples and back to Rome, thence through Tuscany and Venice, he came to Gratz in Styria. There he received information about the Turks who were then swarming through Hungary, and, passing on to Vienna, entered the emperor's service.

In this Turkish war the years 1601 and 1602 soon passed away; many desperate adventures does he narrate (unconfirmed by contemporary records, and doubted by some modern critics), and one in particular covered him with honour. At Regal, in the presence of two armies, as the champion of the Christians, he killed three Turkish champions in succession. On 18th November 1602, at the battle of Rothenthurm, a pass in Transylvania, where the Christians fought desperately against an overpowering force of Crim Tatars, Smith was left wounded on the field of battle. His rich dress saved him, for it showed that he would be worth a ransom. As soon as his wounds were cured he was sold for a slave and then marched to Constantinople, where he was presented to Charatza Tragabigzanda, who fell in love with him. Fearing lest her mother should sell him, she sent him to her brother Timor, pasha of Nalbrits, on the Don, in Tatary. "To her unkind brother this kind lady wrote so much for his good usage that he half suspected as much as she intended; for she told him, he should there but sojourn to learn the language, and what it was to be a Turk, till time made her master of herself. But the Timor, her brother, diverted all this to the worst of cruelty. For, within an hour after his arrival, he caused his 'drubman' to strip him naked, and shave his head and beard so bare as his hand. A great ring of iron, with a long stalk bowed like a sickle, was riveted about his neck, and a coat [put on him] made of ulgry's hair, guarded about with a piece of an undressed skin. There were many more Christian slaves, and nearly a hundred *forsados* of Turks and Moors, and he being the last was the slave of slaves to them all." While at Nalbrits the English captain kept his eyes open, and his account of the Crim Tatars is careful and accurate. "So long he lived in this miserable estate, as he became a thresher at a grange in a great field, more than a league from the Timor's house. The pasha, as he oft used to visit his granges, visited him, and took occasion so to beat, spurn and revile him, that forgetting all reason Smith beat out the Timor's brains with his threshing bat, for they have no flails, and, seeing his estate could be no worse than it was, clothed himself in the Timor's clothes, hid his body under the straw, filled his knapsack with corn, shut the doors, mounted his horse and ran into the desert at all adventure." For eighteen or nineteen days he rode for very life until he reached a Muscovite outpost on the river Don; here his irons were taken off him, and the Lady Callamata largely supplied all his wants. Thence he passed, attracting all the sympathy of an escaped Christian slave, through Muscovy, Hungary and Austria until he reached Leipzig in December 1603. There he met his old master, Prince Sigismund, who, in memory of his gallant fight at Regal, gave him a grant of arms and 500 ducats of gold. Thence he wandered on, sightseeing, through Germany, France and Spain, until he came to Saffi, from which seaport he made an excursion to the city of Morocco and back.

While at Saffi he was blown out to sea on board Captain Merham's ship, and had to go as far as the Canaries. There Merham fought two Spanish ships at once and beat them off. Smith came home to England with him, having a thousand ducats in his purse.

The third period, 1605–1609, is that of Captain Smith's experiences in Virginia. Throwing himself into the colonizing projects which were then coming to the front, he first intended to have gone out to the colony on the Oyapok in South America; but, Captain Leigh dying, and the reinforcement miscarrying, "the rest escaped as they could." Hence Smith did not leave England on this account. But he went heartily into the Virginian project with Captain Bartholomew Gosnold and others. He states that what he got in his travels he spent in colonizing. "When I went first to these desperate designs, it cost me many a forgotten pound to hire men to go, and procrastination caused more to run away than went. I have spared neither pains nor money according to my ability, first to procure His Majesty's letters patents, and a company here, to be the means to raise a company to go with me to Virginia, which beginning here and there cost me nearly five years' [1604–1609] work, and more than five hundred pounds of my own estate, besides all the dangers, miseries and incumbrances I endured gratis." Two colonizing associations were formed—the London Company for South Virginia and the Western Company for North Virginia. Smith was one of the patentees of the Virginia charter of 1609. The colony which Sir W. Raleigh had established at Roanoke island off the American coast had perished, mainly for want of supplies from England, so that really nothing at all was known of the Virginian coast-line when the first expedition left London on 19th December 1606; and therefore the attempt was bound to fail unless a convenient harbour should be found. The expedition consisted of three ships (the "Susan Constant," 100 tons, Captain C. Newport; the "God Speed," 40 tons, Captain B. Gosnold; and a pinnace of 20 tons, Captain J. Ratcliffe), with about 140 colonists and 40 sailors. They made first for the West Indies, reaching Dominica on 24th March 1607. At Nevis, their next stopping-place, a gallows was erected to hang Captain Smith on the false charge of conspiracy; but he escaped, and, though afterwards the lives of all the men who plotted against him were at his mercy, he spared them. Sailing northwards from the West Indies, not knowing where they were, the expedition was most fortunately, in a gale, blown into the mouth of Chesapeake Bay, discovering land on 26th April 1607. Anchoring, they found the James river, and, having explored it, fixed upon a site for their capital in the district of the chief or weroance of Paspaheh, its chief recommendation being that there were 6 fathoms of water so near to the shore that the ships could be tied to the trees. Orders had been sent out for the government of the colony in a box, which was opened on 26th April 1607. Captains B. Gosnold, E. M. Wingfield, C. Newport, J. Smith, J. Ratcliffe, J. Martin and G. Kendall were named to be the council to elect an annual president, who, with the council, should govern. Wingfield was, on 13th May, elected the first president; and the next day they landed at James Town and commenced the settlement.

All this while Smith was under restraint, for thirteen weeks in all. His enemies would have sent him home, out of a sham commiseration for him; but he challenged their charges, and so established his innocency that Wingfield was adjudged to give him £200 as damages. After this, on 20th June 1607, Smith was admitted to the council.

As in going to America in those days the great difficulty was want of water, so in those colonizing efforts the paramount danger was from want of food. "There were never Englishmen left in a foreign country in such misery as we were in this new discovered Virginia. We watched every three nights [every third night], lying on the bare cold ground, what weather soever came, and warded all the next day, which brought our men to be most feeble wretches. Our food was but a small can of barley sodden in water to five men a day. Our drink, cold water taken out of the river, which was, at a flood, very salt, at a low tide, full of slime and filth, which was the destruction of many of our men." So great was the mortality that out of 105 colonists living on the 22nd June 1607 67 died by the following 8th January. The country they had settled in was sparsely populated by many small tribes of Indians, who owned as their paramount chief, Powhatan, who then lived at Werowocomoco, a village on the Pamunkey river, about 12 m. by land from James Town. Various boat expeditions left James Town, to buy food in exchange for copper. They generally had to fight the Indians first, to coerce them to trade, but afterwards paid a fair price for what they bought.

On 10th December 1607 Captain Smith, of whom it is said "the Spaniard never more greedily desired gold than he victail," with nine men in the barge, left James Town to get more corn, and also to explore the upper waters of the Chickahominy. They got the barge up as far as Apocant. Seven men were left in it, with orders to keep in midstream. They disobeyed, went into the village, and one of them, George Cassen, was caught; the other six, barely escaping to the barge, brought it back to James Town. It so happened that Opecanchanough (the brother of Powhatan, whom he succeeded in 1618, and who carried out the great massacre of the English on Good Friday 1621) was in that neighbourhood with two or three hundred Indians on a hunting expedition. He ascertained from Cassen where Smith was, who, ignorant of all this, had, with John Robinson and Thomas Emry, gone in a canoe 20 m. farther up the river. The Indians killed Robinson and Emry while they were sleeping by the camp fire, and went after Smith, who was away getting food. They surprised him, and. though he bravely defended himself, he had at last to surrender. He then set his wits to confound them with his superior knowledge, and succeeded. Opecanchanough led him about the country for a wonder, and finally, about 5th January 1608, brought him to Powhatan at Werowocomoco. "Having feasted him after their best barbarous manner they could, a long consultation was held; but the conclusion was two great stones were brought before Powhatan; then as many as could laid hands on Smith, dragged him to them, and thereon laid his head. And, being ready with their clubs to beat out his brains, Pocahontas, the king's dearest daughter, when no entreaty could prevail, got his head in her arms and laid her own upon his to save him from death. Whereat the emperor was contented Smith should live, to make him hatchets, and her bells, beads and copper; for they thought him as well of all occupations [handicrafts] as themselves."

The truth of this story was never doubted till 1859, when Dr Charles Deane of Cambridge, Mass., edited Wingfield's *Discourse*; in reprinting Smith's *True Relation* of 1609, Deane pointed out that it contains no reference to this hairbreadth escape. Since then many American historians and scholars have concluded that it never happened at all; and, in order to be consistent, they have tried to prove that Smith was a blustering braggadocio, which is the very last thing that could in truth be said of him. The rescue of a captive doomed to death by a woman is not such an unheard-of thing in Indian stories. If the truth of this deliverance be denied, how then did Smith come back to James Town loaded with presents, when the other three men were killed, George Cassen in particular, in a most horrible manner? And how is it, supposing Smith's account to be false, that Pocahontas afterwards frequently came to James Town, and was, next to Smith himself, the salvation of the colony? The fact is, nobody doubted the story in Smith's lifetime, and he had enemies enough.[1]

Space fails to describe how splendidly Smith worked after his deliverance for the good of the colony, how he explored Chesapeake Bay and its influents, how (when all others had failed) the presidency was forced on him on 10th September 1608; how he tried to get corn from Powhatan at Werowocomoco on 12th January 1609, but he fled to Orapakes, 40 m. farther off; how with only eighteen men he cowed Opecanchanough in his own house at Pamunkey, in spite of the hundreds of Indians that were there, and made him sell corn; how well he administered the colony, making the lazy work or starve.

Meanwhile the establishment of this forlorn hope in Virginia had stirred up a general interest in England, so that the London Company were able in June 1609 to send out 9 ships with 500 colonists. Smith had now got the Indians into splendid order; but from the arrival on 11th August of the new-comers his authority came to an end. They refused to acknowledge him, and robbed and injured the Indians, who attacked them in turn. Smith did his best to smooth matters, while the rioters were plotting to shoot him in his bed. In the meantime he was away up the river. On his return, "sleeping in his boat, accidentally one fired his powder bag, which tore his flesh from his body and thighs, 9 or 10 in. square, in a most pitiful manner; but to quench the tormenting fire frying him in his clothes he leaped overboard into the deep river, where, ere they could recover him, he was nearly drowned." Thus disabled, he was sent home on 4th October 1609 and never set foot in Virginia again. Nemesis

[1] Pocahontas never visited James Town after Smith went to England in October 1609, until she was brought there a state prisoner in April 1613 by Captain S. Argall, who had obtained possession of her by treachery on the Potomac river. The colony, while treating her well, used her as a means to secure peace with the Indians. In the meantime, believing Smith to be dead, she fell in love with an English gentleman, John Rolfe, apparently at that time a widower. They were married about 1st April 1614. Subsequently she embraced Christianity. Sir T. Dale, with Rolfe and his wife, landed at Plymouth on 12th June 1616. Before she reached London, Smith petitioned Queen Anne on her behalf; and it is in this petition of June 1616 that the account of his deliverance by the Indian girl first appears. After a pleasant sojourn of about seven months, being well received both by the court and the people, Pocahontas with her husband embarked for Virginia in the *George*, Captain S. Argall (her old captor), but she died off Gravesend about February 1617.

overtook the rioters the winter after he left, which is known in Virginian story as "the starving time." Out of 490 persons in the colony in October 1609 all but 60 died by the following March.

The rest of Smith's life can only be briefly touched upon. The fourth period, 1610–1617, was chiefly spent in exploring Nusconcus, Canada and Pemaquid or North Virginia, to which, at his solicitation, Prince Charles gave the name of New England. His first object was to fish for cod and barter for furs, his next, to discover the coast-line with the view to settlement. Two attempts, in 1615 and 1617, to settle at Capawuck failed, but through no fault of his. It was in connexion with these projects that the Western Company for North Virginia gave him the title of admiral of New England. We cannot better conclude this sketch of his active operations than in his own words printed in 1631. "Having been a slave to the Turks; prisoner among the most barbarous savages; after my deliverance commonly discovering and ranging those large rivers and unknown nations with such a handful of ignorant companions that the wiser sort often gave me up for lost; always in mutinies, wants and miseries; blown up with gunpowder; a long time a prisoner among the French pirates, from whom escaping in a little boat by myself, and adrift all such a stormy winter night, when their ships were split, more than £100,000 lost which they had taken at sea, and most of them drowned upon the Isle of Rhé—not far from whence I was driven on shore, in my little boat, &c. And many a score of the worst winter months have [I] lived in the fields; yet to have lived near thirty-seven years [1593–1630] in the midst of wars, pestilence and famine, by which many a hundred thousand have died about me, and scarce five living of them that went first with me to Virginia, and yet to see the fruits of my labours thus well begin to prosper (though I have but my labour for my pains), have I not much reason, both privately and publicly to acknowledge it, and give God thanks?"

The last period, 1618–1631, of Smith's life was chiefly devoted to authorship. In 1618 he applied (in vain) to Francis Bacon to be numbered among his servants. In 1619 he offered to lead out the Pilgrim Fathers to North Virginia; but they would not have him, he being a Protestant and they Puritans. The charter of the London Virginia Company was annulled in 1624. A list of his publications will be found at the end of this article. Thus having done much, endured much and written much, while still contemplating a *History of the Sea*, Captain John Smith died on 21st June 1631, and was buried in St Sepulchre's Church, London.

Two of the sixty survivors of "the starving time," Richard Potts and William Phettiplace, thus nobly expressed in print, so early as 1612, their estimate of Smith: "What shall I say? but thus we lost him [4th October 1609] that in all his proceedings made justice his first guide and experience his second; ever hating baseness, sloth, pride and indignity more than any dangers; that never allowed more for himself than his souldiers with him; that upon no danger would send them where he would not lead them himself; that would never see us want what he either had, or could by any means get us; that would rather want than borrow or starve than not pay; that loved actions more than words, and hated falsehood and cozenage than death; whose adventures were our lives, and whose loss our deaths."

A fairly complete bibliography will be found in Professor Edward Arber's reprint of Smith's *Works* (Birmingham, 1884), 8vo. The order of their first appearance is, *A True Relation*, &c. (1608) (first attributed to a gentleman of the colony, next to Th. Watson, and finally to Captain Smith); *A Map of Virginia*, ed. by W[illiam] S[immonds] (Oxford, 1612); *A Description of New England* (1616); *New England's Trials* (1620); *New England's Trials*, 2nd ed. (1622); *The General History of Virginia, New England and the Summer Isles* (1624); *An Accidence for all Young Seamen* (1626); the same work recast and enlarged as *A Sea Grammar* (1627), both works continuing on sale for years, side by side; *The True Travels*, &c. (1630); *Advertisements for the Unexperienced Planters*, &c. (1631). Of some of the smaller texts limited 4to editions have been published by Dr C. Deane and J. Carter Brown. See the MacLehose edition (1907) of the *Generall Historie, True Travels* and *Sea Grammar*; A. G. Bradley's *Captain John Smith* (1905), Charles Poindexter's *Captain John Smith and his Critics* (1893), John Fiske's *Old Virginia* (1897), and for criticism of Smith's credibility L. L. Kropf in *Notes and Queries* for 1890, Alexander Brown's *Genesis of the United States* (1890) and E. D. Neill's *History of the Virginia Company of London* (1869). (E. A.)

SMITH, JOHN RAPHAEL (1752–1812), English painter and mezzotint engraver, a son of Thomas Smith of Derby, the landscape painter, was born in 1752. He was apprenticed to a linen-draper in Derby, and afterwards pursued the same business in London, adding, however, to his income by the production of miniatures. He then turned to engraving and executed his plate of the "Public Ledger," which had great popularity, and was followed by his mezzotints of "Edwin the Minstrel" (a portrait of Thomas Haden), after Wright of Derby, and "Mercury Inventing the Lyre," after Barry. He reproduced some forty of the works of Reynolds, some of these plates ranking among the masterpieces of the art of mezzotint, and he was appointed engraver to the prince of Wales. Adding to his artistic pursuits an extensive connexion as a print-dealer and publisher, he would soon have acquired wealth had it not been for his dissipated habits. He was a boon companion of George Morland, whose figure-pieces he excellently mezzotinted. He painted subject-pictures such as the "Unsuspecting Maid," "Inattention" and the "Moralist," exhibiting in the Royal Academy from 1779 to 1790. Upon the decline of his business as a printseller he made a tour through the N. and midland counties of England, producing much hasty and indifferent work, and settled in Doncaster, where he died on the 2nd of March 1812.

As a mezzotint engraver Smith occupies the very highest rank. His prints are delicate, excellent in drawing and finely expressive of colour. His small full-lengths in crayons and his portraits of Fox, Horne Tooke, Sir Francis Burdett and the group of the duke of Devonshire and family support his claims as a successful draughtsman and painter. He had a very thorough knowledge of the principles and history of art, and was a brilliant conversationalist.

SMITH, JOSEPH, Jr. (1805–1844), the founder, in April 1830, of the Church of Jesus Christ of Latter-Day Saints, was born in Sharon, Vermont, on the 23rd of December 1805. He was killed by a mob in a jail at Carthage, Illinois, on the 27th of June 1844. (See Mormons.)

SMITH, MORGAN LEWIS (1822–1874), American general, was born in Oswego county, New York, on the 8th of March 1822. In 1843 he settled in Indiana, and later had some military experience in the United States army. At the outbreak of the Civil War he raised the 8th Missouri regiment, of which he was elected colonel in 1861. He commanded a brigade at the capture of Fort Donelson, and did good service at Shiloh. In July 1862 he was made a brigadier-general U.S.V., and served under Sherman in the river expedition against Vicksburg. At the battle of Chickasaw Bayou he received a severe wound, from which he recovered only in time to join the Army of the Tennessee before Chattanooga. He led his division in the battles of the Chattanooga campaign, as also, in the following year, in the Atlanta campaign. At the battle of Atlanta he commanded Logan's corps. Afterwards he was placed in charge of Vicksburg. General Sherman said of M. L. Smith, "He was one of the bravest men in action I ever knew." He died at Jersey City on the 29th of December 1874.

His brother, Giles Alexander Smith (1829–1876), also a distinguished soldier of the Federal army, was born in Jefferson county, N.Y., on the 29th of September 1829. At the beginning of the Civil War he joined the Missouri volunteers, in which he became a captain. He took part in the capture of Fort Donelson, the battle of Shiloh and the operations against Corinth, becoming, later in 1862, colonel of a regiment which he led at Chickasaw Bayou. After the final campaign against Vicksburg he was promoted brigadier-general of volunteers. He was wounded at the battle of Chattanooga. He took part in the Atlanta campaign, the "March to the Sea" and the Carolinas campaign, rising to the rank of major-general of volunteers. After the war he declined the offer of a colonelcy in the regular army, and was subsequently engaged in politics, retiring from public life in 1872. He died at Bloomington, Ill., on the 8th of November 1876.

SMITH, RICHARD BAIRD (1818–1861), British engineer officer, son of a surgeon in the royal navy, was born on the 31st of December 1818. He was educated at Lasswade and Addiscombe, and joined the Madras Engineers in 1838. Being transferred to the Bengal Engineers, he served through the second

Sikh war, and was present at the battles of Badiwal, Aliwal and Sobraon. He was then for some years employed on canal work, and when the Mutiny broke out was in charge of Roorkee. He promptly concentrated the Europeans in the workshops, and though the native sappers deserted, his forethought prevented any loss of life. When Delhi was invested he was appointed chief engineer in charge of the siege works. He reached Delhi on the 2nd of July, and immediately advised General Barnard to assault the city. Barnard died while the advice was still under consideration, and his successor, General Reed, could not be induced to follow it; and when Reed in turn was succeeded by Archdale Wilson, the besiegers were so weakened by losses that the moment for a successful attack had passed. Baird Smith, however, prevented Wilson from relaxing his hold on Delhi until the arrival of John Nicholson with reinforcements from the Punjab, and of the siege train from Phillour. Nicholson then joined Baird Smith in compelling Wilson to make the assault, which proved successful, on the 14th of September. Baird Smith was ably assisted by Captain Alexander Taylor, but Nicholson was unjust to Baird Smith in assigning to Taylor the chief credit for the siege operations. After the capture of Delhi he returned to Roorkee and to civil employment, and for a time the value of his military services was insufficiently recognized. After the Mutiny he was made A.D.C. to Queen Victoria, became secretary to the government of India in the public works department, and gained well-deserved credit in the famine of 1861. But the onerous character of this work, following a wound and illness at Delhi, broke down his constitution, and he died at sea on the 13th of December 1861. He married a daughter of De Quincey, who long survived him.

See Colonel H. M. Vibart, *Richard Baird Smith* (1897).

SMITH, ROBERT (1689–1768), English mathematician, was born in 1689, probably at Lea near Gainsborough. After attending Leicester grammar school he entered Trinity College, Cambridge, in 1708, and becoming minor fellow in 1714, major fellow in 1715 and senior fellow in 1739, was chosen master in 1742, in succession to Richard Bentley. From 1716 to 1760 he was Plumian professor of astronomy, and he died in the master's lodge at Trinity on the 2nd of February 1768. Besides editing two works by his cousin, Roger Cotes, who was his predecessor in the Plumian chair, he published *A Compleat System of Opticks* in 1738, which gained him the sobriquet of "Old Focus," and *Harmonics, or the Philosophy of Musical Sounds* in 1749. He was the founder of the Smith's prizes at Cambridge, having by his will left £3500 South Sea stock to the university, a portion of the interest from which was to be divided yearly between the two junior B.A.'s who had made the greatest progress in mathematics and natural philosophy.

SMITH, SYDNEY (1771–1845), English writer and divine, son of Robert Smith, was born at Woodford, Essex, on the 3rd of June 1771. His father, a man of restless ingenuity and activity, "very clever, odd by nature, but still more odd by design," who bought, altered, spoiled and sold about nineteen different estates in England, had talent and eccentricity enough to be the father of such a wit as Sydney Smith on the strictest principles of heredity; but Sydney himself attributed not a little of his constitutional gaiety to an infusion of French blood, his maternal grandfather being a French Protestant refugee of the name of Olier. Sydney was the second of a family of four brothers and one sister, all remarkable for their talents. While two of the brothers, Robert Percy, known as "Bobus," afterwards advocate-general of Bengal, and Cecil, were sent to Eton, Sydney was sent with the youngest to Winchester, where he rose to be captain of the school, and with his brother so distinguished himself that their schoolfellows signed a round-robin "refusing to try for the college prizes if the Smiths were allowed to contend for them any more, as they always gained them." At some time during his Oxford career he spent six months in France, being duly enrolled for safety's sake in the local Jacobin club. In 1789 he had become a scholar of New College, Oxford; he received a fellowship after two years' residence, took his degree in 1792 and proceeded M.A. in 1796. It was his wish then to read for the bar, but his father would add nothing to his fellowship, and he was reluctantly compelled to take holy orders. He was ordained priest at Oxford in 1796, and became a curate in the small village of Nether Avon, near Amesbury, in the midst of Salisbury Plain. The place was uncongenial enough, but Sydney Smith did much for the inhabitants, providing the means for the rudiments of education, and thus making better things possible. The squire of the parish, Michael Hicks-Beach, invited the new curate to dine, was astonished and charmed to find such a man in such a place, and engaged him after a time as tutor to his eldest son. It was arranged that they should proceed to the university of Weimar, but, before reaching their destination Germany was disturbed by war, and "in stress of politics" said Smith, "we put into Edinburgh." This was in 1798. While his pupil attended lectures, Smith was not idle. He studied moral philosophy under Dugald Stewart, and devoted much time to medicine and chemistry. He also preached in the Episcopal chapel, where his practical brilliant discourses attracted many hearers.

In 1800 he published his first book, *Six Sermons, preached in Charlotte Street Chapel, Edinburgh*, and in the same year, married, against the wishes of her friends, Catharine Amelia Pybus. They settled at No. 46 George Street, Edinburgh, where, as everywhere else, Smith made numerous friends, among them the future Edinburgh Reviewers. It was towards the end of his five years' residence in Edinburgh, in the eighth or ninth storey or flat in a house in Buccleuch Place, the elevated residence of the then Mr Jeffrey, that Sydney Smith proposed the setting up of a review as an organ for the young malcontents with things as they were. "I was appointed editor," he says in the preface to the collection of his contributions, "and remained long enough in Edinburgh to edit the first number (October 1802) of the *Edinburgh Review*. The motto I proposed for the Review was 'Tenui musam meditamur avena.'—'We cultivate literature on a little oatmeal.' But this was too near the truth to be admitted, and so we took our present grave motto[1] from Publius Syrus, of whom, none of us, I am sure, had ever read a single line." He continued to write for the Review for the next quarter of a century, and his brilliant articles were a main element in its success.

He left Edinburgh for good in 1803, when the education of his pupils was completed, and settled in London, where he rapidly became known as a preacher, a lecturer and a social lion. His success as a preacher, although so marked that there was often not standing-room in Berkeley Chapel, Mayfair, where he was morning preacher, was not gained by any sacrifice of dignity. He was also "alternate evening preacher" at the Foundling Hospital, and preached at the Berkeley Chapel and the Fitzroy Chapel, now St Saviour's Church, Fitzroy Square. He lectured on moral philosophy at the Royal Institution for three seasons, from 1804 to 1806: and treated his subject with such vigour, freshness and liveliness of illustration that the London world crowded to Albemarle Street to hear him. He followed in the main Dugald Stewart, whose lectures he had attended in Edinburgh; but there is more originality as well as good sense in his lectures, especially on such topics as imagination and wit and humour, than in many more pretentious systems of philosophy. He himself had no high idea of these entertaining performances, and threw them in the fire when they had served their purpose—providing the money for furnishing his house. But his wife rescued the charred MSS. and published them in 1850 as *Elementary Sketches of Moral Philosophy*.

With the brilliant reputation that Sydney Smith had acquired in the course of a few seasons in London, he would probably have obtained some good preferment had he been on the powerful side in politics. Sydney Smith's elder brother "Bobus" had married Caroline Vernon, aunt of the 3rd Lord Holland, and he was always a welcome visitor at Holland House. His Whig friends came into office for a short time in 1806, and presented him with the living of Foston-le-Clay in Yorkshire. He shrank from this banishment for a time, and discharged his parish duties through a curate; but Spencer Perceval's Residence Act was

[1] *Judex damnatur cum nocens absolvitur.*

passed in 1808, and after trying in vain to negotiate an exchange, he quitted London in 1809, and moved his household to Yorkshire. The Ministry of "All the Talents" was driven out of office in 1807 in favour of a "no popery" party, and in that year appeared the first instalment of Sydney Smith's most famous production, *Peter Plymley's Letters*, on the subject of Catholic emancipation, ridiculing the opposition of the country clergy. It was published as *A Letter on the Subject of the Catholics to my brother Abraham who lives in the Country, by Peter Plymley.* Nine other letters followed before the end of 1808, when they appeared in collected form. Peter Plymley's identity was a secret, but rumours got abroad of the real authorship. Lord Holland wrote to him expressing his own opinion and Grenville's, that there had been nothing like it since the days of Swift (*Memoir*, i. 151). He also pointed out that Swift had lost a bishopric for his wittiest performance. The special and temporary nature of the topics advanced in these pamphlets has not prevented them from taking a permanent place in literature, secured for them by the vigorous, picturesque style, the generous eloquence and clearness of exposition which Sydney Smith could always command. In his country parish of Foston, with no educated neighbour within 7 m., Sydney Smith accommodated himself cheerfully to his new circumstances, and won the hearts of his parishioners as quickly as he had conquered a wider world. There had been no resident clergyman in his parish for 150 years; he had a farm of 300 acres to keep in order; a rectory had to be built. All these things were attended to beside his contributions to the *Edinburgh Review.* "If the chances of life ever enable me to emerge," he nevertheless writes to Lady Holland, "I will show you I have not been wholly occupied by small and sordid pursuits." He continued to serve the cause of toleration by ardent speeches in favour of Catholic emancipation; his eloquence being specially directed against those who maintained that a Roman Catholic could not be believed on his oath. "I defy Dr Duigenan,"[1] he pleaded, addressing a meeting of clergy in 1823, "in the full vigour of his incapacity, in the strongest access of that Protestant epilepsy with which he was so often convulsed, to have added a single security to the security of that oath." At this time appeared one of his most vigorous and effective polemics, *A Letter to the Electors upon the Catholic Question* (1826).

Sydney Smith, after twenty years' service in Yorkshire, obtained preferment at last from a Tory minister, Lord Lyndhurst, who presented him with a prebend in Bristol cathedral in 1828, and afterwards enabled him to exchange Foston for the living of Combe Florey, near Taunton, which he held conjointly with the living of Halberton attached to his prebend. From this time he discontinued writing for the *Edinburgh Review* on the ground that it was more becoming in a dignitary of the church to put his name to what he wrote. It was expected that when the Whigs came into power Sydney Smith would be made a bishop. There was nothing in his writings, as in the case of Swift, to stand in the way. He had been most sedulous as a parochial clergyman. Doctoring his parishioners, he said, was his only rural amusement. His religion was wholly of a practical nature, and his fellow-clergy had reasons for their suspicion of his very limited theology, which excluded mysticism of any sort. "The Gospel," he said, "has no enthusiasm." His scorn for enthusiasts and dread of religious emotion found vent in middle life in his strictures on missionary enterprise, and bitter attacks on Methodism, and later in many scoffs at the followers of Pusey. Still, though he was not without warm friends at headquarters, the opposition was too strong for them. One of the first things that Lord Grey said on entering Downing Street was, "Now I shall be able to do something for Sydney Smith"; but he was not able to do more than appoint him in 1831 to a residentiary canonry at St Paul's in exchange for the prebendal stall he held at Bristol. He was as eager a champion of parliamentary reform as he had been of Catholic emancipation, and one of his best fighting speeches was delivered at Taunton in October 1831 when he made his well-known comparison of the House of Lords, who had just thrown out the Reform Bill, with Mrs Partington of Sidmouth, setting out with mop and pattens to stem the Atlantic in a storm. Some surprise must be felt now that Sydney Smith's reputation as a humorist and wit should have caused any hesitation about elevating him to an episcopal dignity, and perhaps he was right in thinking that the real obstacle lay in his being known as "a high-spirited, honest, uncompromising man, whom all the bench of bishops could not turn upon vital questions." With characteristic philosophy, when he saw that the promotion was doubtful, he made his position certain by resolving not to be a bishop and definitely forbidding his friends to intercede for him.

[1] Patrick Duigenan, M.P. for the city of Armagh, a Protestant agitator.

On the death of his brother Courtenay he inherited £50,000, which put him out of the reach of poverty. His eldest daughter, Saba (1802–1866), married Sir Henry Holland. His eldest son, Douglas, died in 1829 at the outset of what had promised to be a brilliant career. This grief his father never forgot, but nothing could quite destroy the cheerfulness of his later life. He retained his high spirits, his wit, practical energy and powers of argumentative ridicule to the last. His *Three Letters to Archdeacon Singleton* on the Ecclesiastical Commission (1837–38–39) and his *Petition* and *Letters* on the repudiation of debts by the state of Pennsylvania (1843), are as bright and trenchant as his best contributions to the *Edinburgh Review.* He died at his house in Green Street, London, on the 22nd of February 1845 and was buried at Kensal Green.

Sydney Smith's other publications include: *Sermons* (2 vols., 1809); *The Ballot* (1839); *Works* (3 vols., 1839), including the *Peter Plymley* and the *Singleton Letters* and many articles from the *Edinburgh Review*; *A Fragment on the Irish Roman Catholic Church* (1845); *Sermons at St Paul's* . . . (1846) and some other pamphlets and sermons. Lady Holland says (*Memoir*, i. 190) that her father left an unpublished MS., compiled from documentary evidence, to exhibit the history of English misrule in Ireland, but had hesitated to publish it. This was suppressed by his widow in deference to the opinion of Lord Macaulay.

See *A Memoir of the Reverend Sydney Smith by his daughter, Lady Holland, with a Selection from his Letters edited by Mrs* [*Sarah*] *Austin* (2 vols., 1855); also *A Sketch of the Life and Times of . . . Sydney Smith* (1884) by Stuart J. Reid; a chapter on "Sydney Smith" in Lord Houghton's *Monographs Social and Personal* (1873); A. Chevrillon, *Sydney Smith et la renaissance des idées libérales en Angleterre au XIXe siècle* (1894); and especially the monograph, with a full description of his writings, by G. W. E. Russell in *Sydney Smith* (English Men of Letters series, 1905). There are numerous references to Smith in contemporary correspondence and journals.

SMITH, SIR THOMAS (1513–1577), English scholar and diplomatist, was born at Saffron Walden in Essex on the 23rd of December 1513. He became a fellow of Queens' College, Cambridge, in 1530, and in 1533 was appointed a public reader or professor. He lectured in the schools on natural philosophy, and on Greek in his own rooms. In 1540 Smith went abroad, and, after studying in France and Italy and taking a degree of law at Padua, returned to Cambridge in 1542. He now took the lead in the reform of the pronunciation of Greek, his views after considerable controversy being universally adopted. He and his friend Sir John Cheke were the great classical scholars of the time in England. In January 1543/4 he was appointed first regius professor of civil law. He was vice-chancellor of the university the same year, and became chancellor to the bishop of Ely, by whom he was ordained priest in 1546. In 1547 he became provost of Eton and dean of Carlisle. He early adopted Protestant views, a fact which brought him into prominence when Edward VI. came to the throne. During Somerset's protectorate he entered public life and was made a secretary of state, being sent on an important diplomatic mission to Brussels. In 1548 he was knighted. On the accession of Mary he was deprived of all his offices, but in the succeeding reign was prominently employed in public affairs. He became a member of parliament, and was sent in 1562 as ambassador to France, where he remained till 1566; and in 1572 he again went to France in the same capacity for a short time. He remained one of Elizabeth's most trusted Protestant counsellors, being appointed in 1572 chancellor of the order of the Garter and a secretary of state. He died on the 12th of August 1577. In 1661 the grandson of his brother George was created a baronet, and from him the title has descended to the Smith family of the present day.

His best-known work, entitled *De Republica Anglorum: the Maner of Government or Policie of the Realme of England*, was published posthumously in 1583, and passed through many editions. His epistle to Gardiner, *De recta et emendata linguae Graecae pronunciatione*, was printed at Paris in 1568; the same volume includes his dialogue *De recta et emendata linguae Anglicanae scriptione*. A number of his letters from France are in the foreign state papers.

See A. F. Pollard's article in the *Dict. Nat. Biog.* A life by Strype was published in 1698 (Oxford edition, 1820).

SMITH, THOMAS SOUTHWOOD (1788–1861), English physician and sanitary reformer, was born at Martock, Somersetshire, on the 21st of December 1788. While a medical student in Edinburgh he took charge of a Unitarian congregation. In 1816 he took his M.D. degree, and began to practice at Yeovil, Somerset, also becoming minister at a chapel in that town, but removed in 1820 to London, devoting himself principally to medicine. In 1824 he was appointed physician to the London Fever Hospital, and in 1830 published *A Treatise on Fever*, which was at once accepted as a standard authority on the subject. In this book he established the direct connexion between the impoverishment of the poor and epidemic fever. He was frequently consulted in fever epidemics and on sanitary matters by public authorities, and his reports on quarantine (1845), cholera (1850), yellow fever (1852), and on the results of sanitary improvement (1854) were of international importance. He died at Florence on the 10th of December 1861.

SMITH, WILLIAM (fl. 1596), English sonneteer. He published in 1596 a sonnet sequence entitled *Chloris, or the Complaint of the passionate despised Shepheard*. He was a disciple of Spenser, to whom the two first sonnets and the last are addressed. He signed his name W. Smith, and has sometimes been confused with the playwright Wentworth Smith, who collaborated with John Day, William Haughton and others (1601–1603).

SMITH, WILLIAM (*c.* 1730–1819), English actor, the son of a city tea merchant, was educated at Eton and went up to Cambridge, but his wild pranks soon ended his college career and brought him back to London. His first stage appearance was in 1753 at Covent Garden, where he remained for twenty years, playing important parts. In 1774 he was at Drury Lane under Garrick's management. His forte was gay comedy, and he was the original, indeed unrivalled, Charles Surface. It was in this part that he made his farewell appearance in 1788. He died on the 13th of September 1819. His sporting tastes and social connexions—he married the sister of a peer—led to his being called "Gentleman Smith," a sobriquet his manners seem to have justified. He is to be distinguished from an older English actor, William Smith (d. 1696), the friend of Betterton.

SMITH, WILLIAM (1769–1839), English geologist, appropriately termed "the Father of English geology," and known among his acquaintances as "Strata Smith," was born at Churchill in Oxfordshire on the 23rd of March 1769. Deprived of his father, an ingenious mechanic, before he was eight years old, he depended upon his father's eldest brother, a farmer at Over Norton, who was but little pleased with his nephew's love of collecting "pundibs" (*Terebratulae*) and "pound-stones" (the large Echinoid *Clypeus*, then frequently employed as a pound weight by dairywomen), and with his propensity for carving sundials on soft brown "oven-stone" of his neighbourhood. The uncle was, however, better satisfied when the boy, after studying the rudiments of geometry and surveying, began to take interest in the draining of land; and there is no doubt that William Smith profited in after life by the practical experience he gained with his relative. At the age of eighteen he became assistant to Edward Webb, surveyor, of Stow-on-the-Wold, and traversed the Oolitic lands of Oxfordshire and Gloucestershire, the Lias clays and red marls of Warwickshire and other districts, studying their varieties of strata and soils. In 1791 his observations at Stowey and High Littleton in Somersetshire first impressed him with the regularity of the strata. In 1793 he executed the surveys and levellings for the line of the Somerset Coal Canal, in the course of which he confirmed a previous supposition, that the strata lying above the coal were not horizontal, but inclined in one direction—to the E.—so as to terminate successively at the surface.

On being appointed engineer to the canal in 1794 he was deputed to make a tour of observation with regard to inland navigation. During this tour, which occupied nearly two months, he journeyed to York and Newcastle and returned through Shropshire and Wales to Bath; he carefully examined the geological structure of the country, and corroborated his generalization of a settled order of succession in the strata. After residing for two or three years at High Littleton he removed in 1795 to Bath, and three years later purchased a small estate at Tucking Mill, Midford, about 3 m. distant from the city, where he engaged in the last duties he performed as resident engineer to the Coal Canal (1798–1799). His numerous journeys had satisfied him of the practicability of making a map to show the ranges of the different strata across England, and in 1794 he coloured his first geological map—that of the vicinity of Bath.

At this time he made acquaintance with the Rev. Benjamin Richardson (d. 1832), from 1796 rector of Farleigh Hungerford, who possessed a good collection of local fossils, but knew nothing of the laws of stratification. He had a sound knowledge of natural history, and he greatly aided Smith in learning the names and true nature of the fossils, while Smith arranged his specimens in the order of the strata. By this new friend Smith was introduced to the Rev. Joseph Townsend (1738–1816), rector of Pewsey, and on a notable occasion in 1799 Smith dictated his first table of British Strata, written by Richardson and now in the possession of the Geological Society of London. It was headed *Order of the Strata, and their imbedded Organic Remains, in the neighbourhood of Bath; examined and proved prior to 1799*. In 1813 Townsend published, with due acknowledgment, much information on the English strata communicated by William Smith, in a work entitled *The Character of Moses established for veracity as an historian, recording events from the Creation to the Deluge*. Meanwhile Smith was completing and arranging the data for his large *Geological Map of England and Wales, with part of Scotland*, which appeared in 1815, in fifteen sheets, engraved on a scale of 5 m. to 1 in. The map was reduced to smaller form in 1819; and from this date to 1822 twenty-one separate county geological maps and several sheets of sections were published in successive years, the whole constituting a *Geological Atlas of England and Wales*. Smith's collection of fossils was purchased in 1816–1818 by the British Museum. In 1817 a portion of the descriptive catalogue was published under the title of a *Stratigraphical System of Organized Fossils*. Prior to this, in 1816, he commenced the publication of *Strata Identified by Organized Fossils*, with figures printed on paper to correspond in some degree with the natural hue of the strata. In this work (of which only four parts were published, 1816–1819) is exemplified the great principle he established of the identification of strata by their included organic remains. In January 1831 the Geological Society of London conferred on Smith the first Wollaston medal; on which occasion Sedgwick in an eloquent address referred to Smith as "the Father of English Geology"; and the government conferred upon him a life-pension of £100 per annum. The degree of LL.D. he received from Dublin, at the meeting of the British Association in that city in 1835. In 1838 he was appointed one of the commissioners to select building-stone for the new Houses of Parliament. The last years of his life were spent at Hackness (of which he made a good geological map), near Scarborough, and in the latter town. His usually robust health failed in 1839, and on 28th August of that year he died at Northampton. He was buried at St Peter's church, and a bust by Chantrey was placed in the nave. In 1891 the earl of Ducie erected a monument to his memory at his native place, Churchill.

His *Memoirs*, edited by his nephew, John Phillips, appeared in 1844.

SMITH, SIR WILLIAM (1813–1893), English lexicographer, was born at Enfield in 1813 of Nonconformist parents. He was originally destined for a theological career, but instead was articled to a solicitor. In his spare time he taught himself classics, and when he entered University College he carried off both the Greek and Latin prizes. He was entered at Gray's Inn in 1830, but gave up his legal studies for a post at University College school, and began to write on classical subjects. He next turned his attention to lexicography. His first attempt was the *Dictionary of Greek and Roman Antiquities*, which appeared in 1842. The greater part of this was written by himself. In 1849 followed the *Dictionary of Greek and Roman Biography*, and the *Greek and Roman Geography* in 1857. In this work some of the leading scholars of the day were associated with him. In 1850 he published the first of the school dictionaries; and in 1853 he began the Principia series, which marked a distinct step in the school teaching of Greek and Latin. Then came the *Students' Manuals of History and Literature*, in which the Greek history was the editor's own work. In carrying out this task Smith was most ably seconded by John Murray, the publisher, who, when the original publishers of the dictionaries got into difficulties, volunteered to take a share in the undertaking. The most important, perhaps, of the books edited by William Smith were those that dealt with ecclesiastical subjects. These were the *Dictionary of the Bible* (1860–1865); the *Dictionary of Christian Antiquities* (1875–1880), undertaken in collaboration with Archdeacon Cheetham; and the *Dictionary of Christian Biography* (1877–1887), jointly with Dr Henry Wace. The *Atlas*, on which Sir George Grove collaborated, appeared in 1875. From 1853 to 1869 Smith was classical examiner to the University of London, and on his retirement he became a member of the Senate. He sat on the Committee to inquire into questions of copyright, and was for several years registrar of the Royal Literary Fund. He edited Gibbon, with Guizot's and Milman's notes, in 1854–1855. In 1867 he became editor of the *Quarterly Review*, which he directed with marked success until his death on the 7th of October 1893, his remarkable memory and accuracy, as well as his tact and courtesy, specially fitting him for such a post. He was D.C.L. of Oxford and Dublin, and the honour of knighthood was conferred on him the year before his death.

SMITH, WILLIAM FARRAR (1824–1903), American general, was born at St Albans, Vermont, on the 17th of February 1824, and graduated from West Point in 1845, being assigned to the engineer branch of the army. He was twice assistant professor of mathematics at West Point (1846–1848 and 1855–1856). During the first campaign of the Civil War he was employed on the staff, in August 1861 became brigadier-general of volunteers, and was breveted lieutenant-colonel U.S.A. for his gallantry at the action of White Oak Swamp. In July 1862 he received promotion to the rank of major-general U.S.V. Smith led his division with conspicuous valour at Antietam, and was again breveted in the regular army. On the assignment of General Franklin to a superior command Smith was placed at the head of the VI. corps of the Army of the Potomac, which he led at the disastrous battle of Fredericksburg (*q.v.*). The recriminations which followed led to the famous general order in which several of the senior officers of the army were dismissed and suspended by General Burnside. Smith was one of these, but it is to his credit that he did not leave the army, and as a brigadier-general he commanded troops in Pennsylvania during the critical days of the Gettysburg campaign. Later in 1863 he was assigned to duty as chief engineer of the Army of the Cumberland. As such he conducted the engineer operations which reopened the "cracker-line" from Chattanooga (*q.v.*) to the base of supplies. Of this action the House Committee on military affairs reported in 1865 that "as a subordinate, General W. F. Smith had saved the Army of the Cumberland from capture, and afterwards directed it to victory." Smith was now again nominated for the rank of major-general U.S.V., and Grant, who was much impressed with Smith's work, insisted strongly that the nomination should be confirmed, which was accordingly done by the Senate in March 1864. Grant, according to his own statement, "was not long in finding out that the objections to Smith's promotion were well grounded," but he never stated the grounds of his complaint, and Smith, in the "Battles and Leaders" series, maintained that they were purely of a personal character. For the Virginian campaign of 1864 Smith was specially assigned by Grant to command the XVIII. corps, Army of the James, and he took part in the battle of Cold Harbor and the first operations against Petersburg, after which, while absent on leave, he was suddenly deprived of his command by Grant. He resigned from the volunteers in 1865, and from the U.S. army in 1867. From 1864 to 1873 he was president of the International Telegraph Company, and in 1875–1881 served on the board of police commissioners of New York, becoming president of this in 1877. After 1881 he was engaged in civil engineering work. He died at Philadelphia on the 28th of February 1903.

SMITH, WILLIAM HENRY (1808–1872), English author, was born at Hammersmith, London, in 1808. He was educated at Radley School, and in 1821 was sent to Glasgow University. In 1823 he entered a lawyer's office, in which he remained for five years. He was called to the bar, but had no practice. He contributed to the *Literary Gazette* and to the *Athenaeum*, under the name of "Wool-gatherer," attracting some attention by the delicacy and finish of his style. *Ernesto*, a philosophical romance, appeared in 1835, two poems, *Guidone* and *Solitude*, in 1836, and in 1839 he formed a connexion with *Blackwood's Magazine*, for which he acted as philosophical critic for thirty years. In 1846 a visit to Italy led to the writing of a tale entitled *Mildred*, which was too purely reflective to be successful. In 1851 he declined the chair of moral philosophy at Edinburgh, being unwilling to abandon his quiet, studious life in the Lake District. There he completed his philosophic romance *Thorndale* (1857), which was considered at the time to be a work of real intellectual value. A similar production, *Gravenhurst*, appeared in 1862; a second edition contained a memoir of the author by his wife. Smith died at Brighton on 28th March 1872. He also wrote two plays, one of which, *Athelwold*, was produced by Macready in 1843. It was published with his other tragedy, *Sir William Crichton*, in 1846.

SMITH, WILLIAM HENRY (1825–1891), English man of business and statesman, was born in London on the 24th of June 1825. His father was the founder of the great distributing firm of W. H. Smith & Son, in the Strand, and at an early age he became a partner and devoted himself to the business. He betrayed no political aspirations until 1865, when he came forward as a Conservative to contest Westminster against John Stuart Mill and the Hon. Mr Grosvenor. Defeated on that occasion, he triumphed in 1868, winning a victory when his party was in general vanquished on all sides. The prestige thus obtained combined with wealth and his business abilities to recommend him to Disraeli, who in 1874 made him secretary to the Treasury. In 1877 he gained cabinet rank as first lord of the Admiralty; in 1885 he was successively secretary for War and chief secretary for Ireland; in 1886 he was again at the War Office; and when late in that year Lord Randolph Churchill's resignation necessitated a reconstruction of the ministry, Mr Smith found himself first lord of the Treasury and leader of the House of Commons. He was no orator, and made no pretence to genius, but his success in these high offices was complete, and was admittedly due, not merely to business ability, but to the universal respect which was gained by his patience, good temper, zeal for the public service, and thorough kindness of heart. He died at Walmer Castle (which he occupied as Warden of the Cinque Ports) on the 6th of October 1891. In recognition of his services a peerage in her own right was conferred on his widow, with the title of Viscountess Hambleden. Lady Hambleden (b. 1828) had been a Miss Danvers, and before marrying Mr Smith had been the wife of Mr B. A. Leach, by whom she had a family. Her eldest son by the second marriage, the Hon. W. F. D. Smith (b. 1868), rowed in the Oxford boat, and on his father's death became head of the business; in 1891 he was elected Conservative M.P. for the Strand (London), and was re-elected in 1892, 1895, 1900 and 1906. He married in 1894 Lady Esther Gore, daughter of the earl of Arran.

SMITH, WILLIAM ROBERTSON (1846–1894), Scottish philologist, physicist, archaeologist, Biblical critic, and editor, from 1881, of the 9th edition of this Encyclopaedia, was born on the

8th of November 1846 at Keig in Aberdeenshire, where his father was Free Church minister. He was educated at home and at Aberdeen University, where he attained the highest academic distinctions, winning among other things the Ferguson mathematical scholarship, which is open to all graduates of Scottish universities under three years' standing. In 1866 he entered the Free Church College at Edinburgh as a student of theology. During two summer sessions he studied philosophy and theology at Bonn and Göttingen, making friends in all branches of learning. From 1868 to 1870 he acted as assistant to the professor of natural philosophy in Edinburgh University. During this period he was not only most successful as a teacher, but produced much original work—especially in the experimental and mathematical treatment of electricity—which is still regarded as standard. In 1870 he was appointed and ordained to the office of professor of Oriental languages and Old Testament exegesis at the Free Church College, Aberdeen, and here he began that series of theological investigations which, characterized as they were by learned research and the use of the most scientific methods, were destined to make his name famous. He was the pupil and personal friend of many leaders of the higher criticism in Germany, and from the first he advocated views which, though now widely accepted, were then regarded with apprehension. The articles on Biblical subjects which he contributed to the 9th edition of the *Encyclopaedia Britannica* distressed and alarmed the authorities of the Free Church. In 1876 a committee of the General Assembly of that Church reported on them so adversely that Smith demanded a formal trial, in the course of which he defended himself with consummate ability and eloquence. The indictment dropped, but a vote of want of confidence was passed, and in 1881 Smith was removed from his chair. During this long struggle he was sustained by the conviction that he was fighting for freedom, and at the end of the trial he was probably the most popular, if not the most powerful, man in Scotland. Marks of sympathy were showered on him from all sides.

In 1875 he was appointed one of the Old Testament revisers; in 1880–1882 he delivered by invitation, to very large audiences in Edinburgh and Glasgow, two courses of lectures on the criticism of the Old Testament, which he afterwards published (*The Old Testament in the Jewish Church*, first edition 1881, second edition 1892, and *The Prophets of Israel*, 1882, which also passed through two editions); and soon after his dismissal from his chair he joined Professor Baynes in the editorship of the *Encyclopaedia Britannica*, and after Professor Baynes's death remained in supreme editorial control till the work was completed. His versatility, firmness combined with tact, width of view, and painstaking struggle for accuracy were largely responsible for the maintenance of its high standard. But he did not let his other duties interfere with his Semitic studies. He visited Arabia, Egypt, Syria, Palestine, Tunis and southern Spain, and had an intimate knowledge of, and personal acquaintance with, not only the literature, but the life of the East. His early friendship with J. F. McLennan, that most original student of primitive marriage, had a great influence on Smith's studies, and his attention was always strongly attracted to the comparative study of primitive customs and their meaning. His chief contributions to this branch of learning were his article SACRIFICE in the *Encyclopaedia Britannica*, his *Kinship and Marriage in Early Arabia* (Cambridge, 1885), and above all his *Lectures on the Religion of the Semites* (1st edition 1889, 2nd edition 1894). His originality and grasp of mind enabled him to seize the essential among masses of details, and he had in a marked degree the power of carrying a subject farther than his predecessors.

In 1883 Robertson Smith was appointed Lord Almoner's Professor of Arabic at Cambridge, which henceforth became his home. He occupied rooms in Trinity College till 1885, when he was elected to a professorial fellowship at Christ's College. In 1886 he became university librarian, and in 1889 Adams Professor of Arabic. In 1888–1891 he delivered, as Burnett lecturer, three courses of lectures at Aberdeen on the primitive religion of the Semites. Early in 1890 grave symptoms of constitutional disease manifested themselves, and the last years of his life were full of suffering, which he bore with the utmost courage and patience. He never ceased to work, and when near his end was actively engaged in planning the *Encyclopaedia Biblica*, which he had hoped to edit. He died at Cambridge on the 31st of March 1894, and was buried at Keig. Small and slight in person and never robust in health, Robertson Smith was yet a man of ceaseless and fiery energy; of an intellect extraordinarily alert and quick, and as sagacious in practical matters as it was keen and piercing in speculation; of an erudition astonishing both in its range and in its readiness; of a temper susceptible of the highest enthusiasm for worthy ends, and able to inspire others with its own ardour; endowed with the warmest affections, and with the kindest and most generous disposition, but impatient of stupidity and ready to blaze out at whatever savoured of wrong and injustice. The sweetness and purity of his nature combined with his brilliant conversational powers to render him the most delightful of friends and companions.

(A. E. S.)

SMITH, SIR WILLIAM SIDNEY (1764–1840), English admiral, was the second son of Captain John Smith of the Guards, and was born at Westminster on the 21st of July 1764. He entered the navy, according to his own account, "at the beginning of the American War," being only about eleven years of age. For his bravery under Rodney in the action near Cape St Vincent in January 1780, he was on the 25th of September appointed lieutenant of the "Alcide," 74. After serving in the actions against the French fought by Graves off Chesapeake in 1781 and by Rodney at the Leeward Islands in 1782, he was on the 6th of May of the latter year promoted to be commander of the "Fury" sloop, and on the 18th of October advanced to the rank of captain. His ship having been paid off in the beginning of 1784, he spent two years in France and afterwards visited Spain. From 1790 to 1792 he advised the king of Sweden in the war with Russia, receiving for his services the honour of knighthood. After his return to England he was sent on a mission to Constantinople, and having joined Lord Hood at Toulon from Smyrna in December 1793, he, though only on half pay, was actively employed in the attempt to burn the enemy's ships and arsenal. In the following years he was engaged in the Channel hunting French privateers; but, having with the boats of his squadron boarded in Havre-de-Grâce harbour a lugger which was driven by the tide above the French forts, he was on the 19th of April 1796 compelled to surrender and sent a prisoner to Paris. By means of forged orders for his removal to another prison he made his escape from the Temple, and, crossing the Channel in a small skiff picked up at Havre, arrived in London on the 8th of May 1798. In October he was appointed to the command of the "Tigre," 80, and was sent to the Mediterranean. By a very curious decision of the government he was joined in commission with his brother Spencer Smith, minister at Constantinople. Learning of Bonaparte's approach to St Jean d'Acre, he hastened to its relief, and on the 16th of March 1799 captured the enemy's flotilla, after which he successfully defended the town, compelling Napoleon on the 20th of May to raise the siege and retreat in disorder, leaving all his artillery behind. For this brilliant exploit he received the special thanks of the Houses of Parliament and was awarded an annuity of £1000. On the 24th of January 1800 he took upon himself to make the convention of El Arish, by which the French were to have been allowed to evacuate Egypt. His action was disallowed by his superiors, who insisted that the French must surrender. Subsequently he co-operated with Abercromby, under whom he commanded the naval brigade at the battle of Aboukir, where he was wounded. On his return to England he was in 1802 elected M.P. for the city of Rochester. In March 1803 he was commissioned to watch the preparations of the French for an invasion of England. Having on the 9th of November 1805 been promoted to be rear-admiral of the blue, he was in the following January despatched on secret service for the protection of Sicily and Naples. His conduct was as usual brilliant, but, also as usual, his vanity and self-assertion led him into quarrels with the military officers. He relieved Gaeta and captured Capri, but on the 25th of January 1807 received orders to proceed to Malta, whence he joined Sir John Duckworth, who was sent to act against the Turks. On the 7th of February, with the rear division of the squadron, he destroyed the Turkish fleet and spiked the batteries off Abydos. In November following he was sent to blockade the Tagus, and was mainly instrumental in embarking the Portuguese prince regent and royal family for Rio de Janeiro, after which he was sent as commander-in-chief to the coast of S. America in February 1808. At Rio he was entangled in another quarrel with the British minister, Lord Strangford, and was summarily recalled in 1809. On the 31st of July 1810 he was made vice-admiral of the blue, and on the 18th of July 1812 was despatched as second in command under Sir Edward Pellew (afterwards Viscount Exmouth) to the Mediterranean, but the expedition was uneventful. His term of active service practically closed in 1814. He was made K.C.B. in 1815 and in 1821 admiral. The later years of his life were spent at Paris, where he died on the 26th of May 1840. His restless self-assertion brought him into collision with many of his contemporaries, including Nelson and Sir John Moore. Colonel Bunbury's *Narrative of some Passages in the Great War with France* contains a most amusing account of his theatrical vanity. But though by nature a boaster he was both daring and ingenious.

See Barrow, *Life of Admiral Sir W. S. Smith* (2 vols., 1848).

SMITH, a worker in metals. The O. Eng. *smid*, Du. *smid*, Ger. *Schmied*, &c., are from an obsolete Teut. verb *smeithan*, to forge. The root is seen in Gr. σμίλη, a graver's tool. It is apparently not connected with "smooth," where an original *m* has been lost. There is no foundation for the old etymological guess which identifies "smith" with "to smite," as the one who smites or beats iron. When used without such qualification as appears in "goldsmith," "silversmith," &c., the term means a worker in iron, especially as indicating a "blacksmith," one who forges iron, as opposed to "whitesmith," the finisher and polisher of iron, or "tinsmith," a worker in tin. The word has originated one of the commonest of English surnames, sometimes taking various archaic forms (Smyth, Smythe, Smigth, &c.; also German Schmidt).

SMITH COLLEGE, an American institution for the higher education of women, at Northampton, Massachusetts. It was founded by the will of Sophia Smith (1796–1870) of Hatfield, who gave money to Smith Academy in Northampton and to Andover Theological Seminary, and who left about $365,000 "for the establishment and maintenance of an institution for the higher education of young women, with the design to furnish them means and facilities for education equal to those which are afforded in our colleges for young men"; she chose Northampton as the site of the college and selected the trustees. The college was chartered in 1871 and was opened in 1875.

On the college campus in the central part of Northampton are: College Hall, with administrative offices, an assembly hall, and lecture rooms; Seelye Hall, with department offices and recitation rooms; a library, completed in 1910 and containing 30,000 volumes in that year; an auditorium, with a large organ and a seating capacity of 2500; the Lilly Hall of Science; Chemistry Hall; an astronomical observatory; Music Hall; the Hillyer Art Gallery, with an endowment of $50,000 for the increase of its collections; the Students' Building for the social life of the students; the Lyman Plant House and the Botanic Garden; the Alumnae Gymnasium; the Allen Recreation Field; sixteen (in 1910) dwelling-houses for the students on the plan of private homes, not dormitories; an infirmary; and Sunnyside, a home for convalescents. Entrance requirements differ little from those of the College Entrance Examination Board. All undergraduate courses are largely elective and lead to the degree of Bachelor of Arts. Graduate courses lead to the degrees of Master of Arts and Doctor of Philosophy, the latter degree being rarely conferred and "only in recognition of high scholarly attainment and of ability to carry on original research." In 1909–1910 there were 104 teachers and 1635 students (of whom 8 were graduate students), and the college had an endowment of about $1,300,000. The annual tuition charge was $100 until 1909, when it became $150. There are six fellowships, of $500 each, which are granted for graduate research; and there are many undergraduate scholarships, and loans are made to needy students by the Smith Students' Aid Society (1897). The College contributes to the American Classical Schools at Athens and Rome, to the Zoological Station at Naples, and to the Marine Biological Laboratory at Woods Hole, Massachusetts. The first president of the college from 1873 to September 1910 was Lawrenus Clark Seelye (b. 1837), a graduate of Union College and of Andover Theological Seminary.

SMITH'S FALLS, a town and outport of Lanark county, Ontario, Canada, on the Rideau river and canal, and the Canadian Pacific railway, 28 m. N.W. of Brockville. Pop. (1901) 5155. It contains saw, shingle, woollen and planing mills, and large agricultural implement works, and has regular steamer connexion with Kingston and Ottawa by the Rideau river and canal.

SMITHSON, HENRIETTA CONSTANCE (1800–1854), Irish actress, was the daughter of a theatrical manager. She made her first stage appearance in 1815 at the Crow Street theatre, Dublin, as Albina Mandeville in Reynolds's *Will*. Three years later she made her first London appearance at Drury Lane as Letitia Hardy. She had no particular success in England; but in Paris, in 1828 and 1832, whither she first went with Macready, she aroused immense enthusiasm as Desdemona, Virginia, Juliet and Jane Shore. She had a host of admirers, among them Hector Berlioz (*q.v.*), whom she married in 1833. They separated in 1840. At the time of her marriage her popularity was already over and she was deeply in debt. A benefit was given her, but she had the mortification of seeing a rival applauded when she herself was coldly received. She retired from the stage, and died on the 3rd of March 1854.

SMITHSON, JAMES (1765–1829), British chemist and mineralogist and founder of the Smithsonian Institution at Washington, a natural son of Hugh Smithson, 1st duke of Northumberland, by Mrs Elizabeth Keate Macie, a granddaughter of Sir George Hungerford of Studley, was born in France in 1765. He was educated at Pembroke College, Oxford, where he graduated in 1786, and was known in early life as James Lewis (or Louis) Macie. He took the name of James Smithson about the year 1800. His attention was given to chemistry and mineralogy, and he published analyses of calamines and other papers in the *Annals of Philosophy* and *Phil. Trans.* The mineral name "smithsonite" was originally given in his honour by Beudant to zinc carbonate, but having also been applied to the silicate, the name is now rarely used. In 1784 he accompanied Faujas St Fond in his journey to the Western Isles, and in the English translation of the *Travels in England, Scotland and the Hebrides* (1799) Smithson is spoken of as "M. de Mecies of London." He was elected F.R.S. in 1787. He died at Genoa on the 27th of June 1829. By his will he bequeathed upwards of £100,000 to the United States of America to found the Smithsonian Institution. The institution (see below) was founded by act of Congress on the 10th of August 1846.

See "James Smithson and his Bequest" (with portraits), by W. J. Rhees, and "The Scientific Writings of James Smithson," edited by W. J. Rhees, *Smithsonian Misc. Coll.*, vol. xxi. (1879–1880).

SMITHSONIAN INSTITUTION, an American institution of learning in Washington, D.C., founded by the bequest of James Smithson (*q.v.*), who seems to have known of Joel Barlow's plan for a national institution of learning in the city of Washington in accordance with George Washington's recommendation in his farewell address of 1796. His estate was left to a nephew, Henry James Hungerford, with the stipulation that should Hungerford die without issue the whole estate should go "to the United States of America to found at Washington, under the name of the Smithsonian Institution, an establishment for the increase and diffusion of knowledge among men." Hungerford died without issue in 1835. There was much opposition in America to the acceptance of Smithson's bequest, especially by John C. Calhoun and others who held that Congress had no power under the Constitution to accept such a gift, but the gift was accepted, largely through the efforts of John Quincy Adams; and Richard Rush, sent to England as agent for the United States, quickly obtained a verdict for the American claim to the estate. In September 1838 £104,960 in gold sovereigns was delivered from the clipper "Mediator" to the Philadelphia mint, where it was recoined into American money, $508,318·46; in 1867, after the death of Hungerford's mother, a residuary legacy of $26,210 was received and the fund then amounted to $650,000. An act of the 7th of July 1838 (repealed in 1841) directed the investment of the money in state bonds, and $500,000 was invested in Arkansas bonds which proved worthless, but Congress, considering that it was a trustee of the fund, made an appropriation to cover the loss. By other gifts, notably that of $216,000 from Thomas George Hodgkins (d. 1892) of Setauket, Long Island, New York, the fund was increased: in 1910 it amounted to $944,918, drawing interest at 6%.

There were many different suggestions as to how the fund should be used. The character of the National Institute (called National Institution before 1843), which was organized in 1840 "to promote science and the useful arts and to establish a national museum of history," had a great influence in shaping the act (approved on the 10th of August 1846) establishing the Smithsonian Institution and providing for an "establishment" by this name composed of the president, vice-president, secretaries of state, treasury, war and navy, the postmaster-general, the attorney-general,[1] the chief-justice of the supreme court and the commissioner of the patent office of the United States, the mayor of the city of Washington (amended in 1871 to read: governor of the District of Columbia), and such other persons as they may elect honorary members.[2] The same act provided for the government of the Institution by a Board of Regents composed of the vice-president of the United States, the mayor of the city of Washington (amended in 1871 as above), three members of the Senate (appointed by its president), three members of the House of Representatives[3] (appointed by its speaker), two members of the National Institute of the City of Washington (chosen by joint resolution of the Senate and House of Representatives), and four others, inhabitants of four different states; the Board chose from its members a chancellor (in practice the vice-president of the United States until 1850 and since then the chief-justice). The act provided for the delivery to the Board of Regents and the maintenance in the buildings, which were to be erected according to the act, of "all objects of art and of foreign and curious research, and all objects of natural history," &c., belonging to the United States, including the collections of Smithson; and it enacted that any applicant for copyright should deliver one copy of the work to be copyrighted to the librarian of the Smithsonian Institution and another to the Librarian of Congress.[4] Thanks to the efforts of J. Q. Adams, provision was made for the use of the income of the fund only and the principal was permanently invested.

The Regents met on the 7th of September 1846. Those appointed were: George Evans, Sidney Breese and Isaac S. Pennybacker, senators; Robert Dale Owen, William J. Hough and Henry W. Hilliard, members of the House of Representatives; Rufus Choate, Gideon Hawley, Richard Rush and William C. Preston, by joint resolution, from four different states; and Alexander Dallas Bache and General Joseph G. Totten, from the National Institute. They elected (Dec. 1846) as first secretary and director of the Institution, Joseph Henry, then professor of natural philosophy in the College of New Jersey (Princeton University), who presented in his first annual report (Dec. 1847) a "program of organization."[5] The first paragraph contained the following:—"*To Increase Knowledge:* It is proposed (1) to stimulate men of talent to make original researches, by offering suitable rewards for memoirs containing new truths; and (2) to appropriate annually a portion of the income for particular researches, under the direction of suitable persons. *To Diffuse Knowledge*: It is proposed (1) to publish a series of periodical reports on the progress of different branches of knowledge; and (2) to publish occasionally separate treatises on subjects of general interest."

[1] The Secretary of the Interior was added in 1877 and the Secretary of Agriculture in 1894.

[2] No honorary members have been chosen since 1873, and an amendment of 1894 omits the provision for their election.

[3] In January 1847 James D. Westcott objected to the constitutionality of the act because by it members of Congress were appointed (contrary to section 6, part ii. of the Constitution) to civil offices under the authority of the United States created during their term of office in Congress.

[4] In 1865 the actual granting of copyright was transferred from the Smithsonian Institution to the Library of Congress.

[5] Reprinted in *Smithsonian Institution Miscellaneous Collections*, vol. xxi. pp. 399-406.

Henry was executive head (secretary) of the Institution from 1846 until his death in 1878 and its organization is due largely to him. He opposed the scheme for the gradual formation of a general library under the charge of the Institution, and in 1855 committed the Board of Regents to a repeal of the previous practice of spending one-half of the annual income on the museum and library, and this action was approved by an investigating congressional committee.[6] Partly because of the prominence given to meteorological research when Henry was at the Albany Academy, and partly through the influence of James Pollard Espy (1785–1860), in 1846 a plan was presented for the unification and systematization of weather observation under the Institution, and in December 1847 an appropriation was made for such meteorological research; in 1849 telegraphic transmission of meteorological intelligence collected by the Institution was begun; in 1850 a standard "Smithsonian barometer" (Arnold Guyot's improvement of Ernst's improved Fortin "cistern barometer") was first distributed; weather maps were successfully made in 1856; and in 1870 the meteorological work of the Institution was incorporated as the Weather Bureau, independent of the Institution. After 1854 Henry's annual reports contained a "general appendix" with reports of lectures, such as were held under the auspices of the Institution until 1865, summaries of correspondence, special papers, &c. Before 1870 meteorology bulked largely in these reports; after that year there was more North American archaeology and ethnology.

Spencer F. Baird, Henry's successor, incorporated in the general appendix annual reports on the progress of the sciences, and he perfected Henry's system of "international exchanges," under which the Institution, through agents in the principal cities of Europe, exchanges its own publications, those of other departments of the United States government, and those of learned societies for foreign publications. Baird had been at the head of the United States National Museum, a branch of the Institution, before he became secretary of the Institution, and it was particularly developed during his administration. It was built up around the collections of the United States Patent Office, which were turned over to it in 1858, and those of the National Institute, transferred to the Smithsonian Institution in 1861, when the Institute was dissolved. A part of the collection (including Smithson's collection) was destroyed by fire in 1865. The small art collection which remained was exhibited in the Corcoran Gallery until 1896. A new building for the Museum was erected in 1881. Mrs Harriet Lane Johnston (1833–1903) left her art collection to a national gallery of art, when such a gallery should be established, and in 1906 the Supreme Court of the District of Columbia decreed that the art collection of the National Museum was a "National Gallery" and turned this collection over to the National Museum, whose art collections have been called since that time the National Gallery of Art and have been enlarged by the gift from Charles L. Freer of Detroit of more than 2300 pieces (since 1904), including the work of American artists (especially Whistler, Tryon and T. W. Dewing) and of Japanese and Chinese masters, and by the gift of about 90 American paintings from W. T. Evans of New York City. The museum gained much valuable archaeological and ethnological material from the exploring parties sent out under J. W. Powell, excellent ichthyological specimens through Baird's position as United States Fish Commissioner, and general collections from the exhibits made at the Centennial Exhibition of 1876 by the United States government; and it has a good herbarium. The Bureau of American Ethnology was established as a branch of the Institution in 1879, when the various organizations doing survey work in the West united as the United States Geological Survey and anthropological and ethnological research was transferred to the Smithsonian Institution. The director of the Bureau of Ethnology in 1879–1902 was J. W. Powell; he was succeeded by William H. Holmes.

Secretary Baird planned an astrophysical observatory and in 1887 appointed as assistant secretary of the Institution, to take charge of the observatory, Samuel P. Langley (*q.v.*), who succeeded as secretary[7] upon Baird's death in the same year. In 1890 a small observatory was built in the Smithsonian Park; in 1891 an appropriation was made for astrophysical work and $5000 was contributed by the executors of Dr J. H. Kidder (1842–1889). Langley's principal research in the observatory was on the nature of the infra-red portion of the spectrum. His name is also closely connected with his paper entitled *Experiments in Aërodynamics* (1891), and with the experiments and mathematical studies carried on under the Institution which proved that a machine other than a balloon could be made which would produce enough mechanical power to support itself and fly. Under the terms of the Hodgkins bequest prizes were

[6] Congress was long jealous of the power of the Board of Regents; and in Congress there was for many years open opposition notably on the part of Andrew Johnson, to the very existence of the Institution.

[7] In January 1907, after Langley's death, Charles Doolittle Walcott (b. 1850), a geologist, director of the U.S. Geological Survey in 1894–1907, became secretary of the Institution.

offered in 1893 for research and investigation of atmospheric air in connexion with the welfare of mankind; in 1895 an award of $10,000 was made to Lord Rayleigh and Sir William Ramsay for their discovery of argon; and a medal was awarded to Sir James Dewar in 1899 and one to Sir J. J. Thomson in 1901. During Langley's administration the American Historical Association was incorporated in 1889 as a branch of the Institution, to whose secretary it makes its annual reports; and the National Society of the Daughters of the American Revolution was similarly incorporated in 1896. By acts of Congress of the 2nd of March 1889 and the 30th of April 1890 the National Zoological Park was established under the Institution; and in a park of 266 acres in the valley of Rock Creek a small collection was installed. In Langley's Annual Reports the summaries of the advance of science were omitted in 1889 and thereafter special papers of interest to professional students were published in their place. The Smithsonian Park occupies a square equivalent to nine city blocks, almost exactly the same size as the Capitol grounds. The oldest building, that of the Institution proper, was erected in 1847–1855; it is Seneca brown stone in a mingled Gothic and Romanesque style, designed by James Renwick, and occupies the S.W. corner of the grounds. E. of it is the building of the United States National Museum (330 ft. sq.), erected in 1881; and on the N. side of the park is the new building of the National Museum (1903). On the grounds is a bronze statue of Joseph Henry by W. W. Story.

The Institution publishes: *Annual Reports* (1846 seq.), in which the *Reports* of the National Museum were included until 1884—since then they appeared as "part ii." of that *Report*; *The Smithsonian Contributions to Knowledge* (quarto, 1848 sqq.); *The Smithsonian Miscellaneous Collections* (octavos, 1862 sqq.); *Proceedings of the United States National Museum* (1878 sqq.); *Bulletin of the United States National Museum* (1875 sqq.), containing larger monographs than those printed in the *Proceedings*; and occasional *Special Bulletins*; *Annual Reports of the Bureau of American Ethnology* (1880 sqq.); *Bulletin* (1877 sqq.), including *The Handbook of American Indians North of Mexico* (1907), part i. being Bulletin 30; and *Contributions to North American Ethnology* (1877 sqq.); *Annals of the Astrophysical Observatory* (1900 sqq.); and *Annual Reports of the American Historical Association* (1890 sqq.).

Authorities.—See Wm. J. Rhees, *A List of Publications of the Smithsonian Institution, 1846–1903* (Washington, 1903), being No. 1376 of the Smithsonian Miscellaneous Collections; also *The Smithsonian Institution, 1846–1896: The History of its First Half-Century* (Washington, 1897), edited by George Brown Goode, assistant secretary of the Institution; Wm. J. Rhees, *Smithson and His Bequest* (*ibid.* 1880), and *The Smithsonian Institution, 1846–1899* (*ibid.* 1901); and Richard Rathbun, *The National Gallery of Art* (*ibid.* 1909), being Bulletin 70 of the U.S. National Museum.

SMOHALLA, or Shmoquala (*i.e.* "preacher"), chief of the Wanapum tribe of North American Indians and founder of the religious sect called Dreamers, was born about 1820. On one occasion after a tribal fray he was left for dead, but recovered and journeyed through California, Mexico, Arizona and Nevada to his old home on the upper Columbia, Washington, where he announced that he had been in the spirit world and had returned with a new revelation. This consisted in a return to primitive Indian customs, and a priesthood and ritual based on the Roman Catholic type. Besides Sunday services the Dreamers hold a service for the commemoration of the dead in early spring, and thanksgivings for salmon and for berries in April and in October respectively. Smohalla had frequent trances and his influence extended over most of the tribes of eastern Washington, and Oregon and western Idaho. The sect gave some trouble in 1870 by refusing to come under reservation restrictions. A church was established at Priest's Rapids on the upper Columbia, and one at Union Gap on the Yakima reservation.

See James Mooney, "The Ghost-dance religion," in *14th Ann. Rep. Bureau of Ethnology* (Washington, 1896).

SMOKE (from O. Eng. *smēocan*, to smoke, reek, cf. Dutch *smook*, Ger. *Schmauch*, probably allied to Gr. σμύχειν), the vapour or volatile matter which escapes from a burning substance during combustion, especially the visible vapour produced by the burning of coal, wood, peat or vegetable substances generally. In this article the various legislative and other measures recommended or adopted for the abating of the nuisance caused by the excessive production of smoke are dealt with. For smoking of tobacco see Tobacco and Pipe, and for opium-smoking Opium.

Smoke Abatement.—The nuisance created by coal smoke seems to have been recognized in London since 1306, when a citizen was tried, condemned and executed for burning "sea cole" in the city of London; but it is only in more modern times that the question has been regarded as one of real practical importance. In 1785 the first smoke-abating invention was patented by James Watt, and in 1800 a mechanical stoker was patented by Robertson. In 1815 Cutler patented the first would-be smokeless grate for domestic purposes; and his principle of feeding underneath was afterwards adopted by Dr Neil Arnott. In 1819 a parliamentary select committee was appointed "to inquire how far persons using steam-engines and furnaces could erect them in a manner less prejudicial to public health and comfort." In 1843 another select committee recommended the introduction of a bill prohibiting the production of smoke from furnaces and steam-engines. In 1845 yet another select committee reported that such an act could not in the existing state of affairs be made to apply to dwelling-houses. The Acts of 1845 and 1847 followed as the results of these inquiries; and since then there has been much legislation brought to bear on factories and railways.

The Public Health Act 1875 contains the statutory law as to the emission of smoke and applies throughout the country, except to London and a few large provincial towns such as Manchester, Liverpool, Sheffield, Leeds, Bradford and Nottingham, where smoke nuisances are controlled by special local acts. The law applying to the Metropolis is identical with that which governs the country at large, and is contained in the Public Health (London) Act 1891.

Section 91, sub-section 7, of the Public Health Act 1875 enacts: "Any fireplace or furnace which does not, as far as practicable, consume the smoke arising from the combustible used therein, and which is used for working engines by steam, or in any mill, factory, dyehouse, brewery, bakehouse or gaswork, or in any manufacturing or trade process whatsoever"; and sub-sec. 8, "any chimney (not being the chimney of a private dwelling-house) sending forth black smoke in such quantity as to be a nuisance, shall be deemed to be a nuisance liable to be dealt with summarily in manner provided by this act."

A further clause provides that for the purposes of sub-sec. 7 the offence is not merely the emission of smoke, but the use of a fireplace or furnace "which does not as far as practicable consume the smoke," and this enables a technical defence to be raised which in practice has been found to destroy the efficacy of sub-sec. 7. Under sub-sec. 8 the mere fact of sending forth black smoke in such quantity as to be a nuisance is an offence, unless it be emitted from the chimney of a private dwelling-house. This sub-section is therefore always resorted to by sanitary authorities who initiate prosecutions for smoke nuisances. It has been decided that where black smoke issued from a chimney several times a day for varying periods the magistrate was justified in finding that the smoke issued in "such quantity as to be a nuisance," although it was not shown that any particular person, or property, was injuriously affected thereby (*South London Electric Supply Corporation* v. *Perrin* (1901) 2 K.B. 186). It has also been held that smoke need not be injurious to health in order to be a nuisance (*Gaskell* v. *Bayley*, 30 L.T.N.S. 316). It therefore follows that the issue of black smoke from ordinary factory chimneys is *per se* a nuisance. From a practical point of view, however, it is often found difficult to identify exactly the colour of the smoke, the appearance of which varies in accordance with the position of the observer, and the light behind or in front of the smoke. To aid inspectors various smoke charts and instruments have been devised, none of which is wholly satisfactory. The best chart is the Ringlemann smoke scale, made by ruling black lines at right angles on a white background. It has six shades, numbered 0–5, obtained by graduating the thickness of the lines.

The difficulty of accurately defining the colour of smoke has led to a movement, initiated by the London County Council, for securing the deletion of the word "black" from the Public Health Act, so as to leave to magistrates the duty of deciding a question of fact—whether the smoke complained of constituted a nuisance. The Nottingham Improvement Act 1874 (sec. 74) contains the most efficacious provisions in regard to smoke nuisances which are to be met with in England. It enables steps to be taken in cases where the engines or furnaces are not suitable, and if they are properly constructed, but negligently used, it enables the fireman or other responsible employee to be fined.

Although steam-engines and factories consume individually much more coal than dwelling-houses, they alone are not responsible for the smoke nuisance, for there is little doubt that domestic fires are mainly responsible for the smoky condition of the atmosphere of our towns, for they continue to evolve smoke undeterred by legislation. In 1881, however, a movement was begun by the National Health Society and the Kyrle Society, which resulted in a smoke abatement exhibition being held at

South Kensington. At the close of the exhibition a national smoke abatement institution, with offices in London, was formed.

In the United Kingdom the subject takes an important place in the programme of the Royal Sanitary Institute, whilst the Coal Smoke Abatement Society is devoted to improving the prevailing conditions, especially in the Metropolis, and has organized a number of exhibitions and conferences on the subject. Several smoke abatement committees exist in the provinces.

A knowledge of the nature of coal and of its combustion is essential for an understanding of the smoke problem. For the purposes of this article coals may be classified as smoke-producing or bituminous, and smokeless, the former including all those varieties most commonly used as fuel. The elementary constituents of such coals are carbon (generally about 80%), hydrogen, nitrogen, oxygen and sulphur, and they also contain a varying quantity of earthy impurity or ash. The process which occurs in a coal fire consists of two distinct operations. The first, which requires a comparatively low temperature and is independent of the presence of air, is one of destructive distillation, similar to that which occurs in the retorts of gasworks. It results in the decomposition of the coal, and the formation of the following substances:—(1) hydrogen, marsh-gas, carbon monoxide, ethylene, benzene, other hydrocarbons of the paraffin and benzenoid series, water—all of which are either gaseous at the temperature at which they are formed or capable of being converted into gas at somewhat higher temperatures, and all of which are combustible except the water; (2) ammonia and other nitrogenous compounds and certain compounds of sulphur, which are also volatile and combustible; (3) coke, which consists of carbon (and ash) and is non-volatile but combustible. It is these products of distillation, not the coal itself, that burn, in the strict sense of the word; and this second process requires the presence of air and also a much higher temperature than the first. If the combustion is perfect, the only products are (1) water-vapour, (2) carbon dioxide, (3) nitrogen and (4) sulphur dioxide, the first of which contains all the hydrogen originally present in the coal, the second all the carbon, the fourth all the sulphur, while the nitrogen is liberated as such together with the very much larger volumes of nitrogen derived from the air which has supplied the necessary oxygen. These products are discharged through the chimney.

Two things are necessary for ensuring such complete combustion, viz. an adequate, but not too large, supply of air, properly administered, and the maintenance of the requisite temperature. In practice, however, these conditions are never perfectly fulfilled, and consequently the combustion of coal is always more or less imperfect and gives rise to a complex mixture of vapours. This mixture contains not only the combustion products already mentioned, but also the following unburnt or partly burnt distillation products:—(5) hydrogen, (6) hydrocarbons, (7) carbon monoxide, (8) unburnt carbon in a very finely divided state, and also considerable volumes of unused air.

Usually the name "smoke" is applied to this vaporous mixture discharged from a chimney only when it contains a sufficient amount of finely divided carbon to render it dark-coloured and distinctly visible. The quantity, however, of this particular ingredient is apt to be overrated. It always bears an extremely small proportion to the vast volumes of water-vapour, carbon dioxide and nitrogen with which it is mixed; it probably never amounts, even in the worst cases, to 3% of the weight of the coal from which it is formed; and its importance, reckoned in terms of so much fuel wasted, is certainly not greater than that of the unburnt hydrogen and hydrocarbons. It is perhaps best to use the name "smoke" for all the products of imperfect combustion (5 to 8) which are avoidable, as contrasted with the necessary and unavoidable ingredients (1 to 4). The problem of smoke abatement is thus seen to resolve itself into the problem of the production of perfect combustion.

The solution of this problem would lead to an important saving in fuel. It has been calculated that at least twice as much coal is used in boiler fires and six times as much in domestic fires as is theoretically required for the production of the effects obtained. A considerable portion of this loss is certainly unavoidable; nevertheless, much of this enormous waste could be prevented by improved methods of combustion. Another advantage is the gain in cleanliness and public convenience; not only would there be an end to sooty chimneys, but the atmosphere of towns would no longer be polluted by unburnt carbon, whose total quantity is enormous, though the amount contained in any given puff of smoke is very small. The "London" or "pea-soup" fog would be avoided, not because fogs would become any less frequent than now in London and other large cities, but because they would lose their distinctive grimy opacity.

An investigation of London fogs was made in 1901–1903 by the Meteorological Council with the assistance of the London County Council, from which it appeared that 20% of fogs were entirely due to smoke, and that in every case the density and duration of fogs was enormously added to by smoke.

It is often stated that these fogs are *caused* by the smoke that blackens them; but this is an error. The combustion of coal is certainly responsible for their existence, but it is the sulphur of the coal (oxidized ultimately to sulphuric acid), and not the carbon, that is the active agent. So long as coal is burnt at all this manufacture of sulphuric acid and of fogs must continue; it is not to be got rid of by improved methods of combustion, though the character of the fogs may be materially improved. The evil effects of town air on plant life and human lungs, also often attributed to preventible smoke, are in like manner due to this non-preventible sulphuric acid. Sixteen million tons of coal are annually used in London for heating purposes, and it has been shown by Dr Rideal that, as the sulphur content of this coal ranges from 1 to 2%. there is diffused in the air of the metropolis from half a million to a million tons of sulphuric acid every year. The extent to which smoke and fog affect life and injure property is, perhaps, a matter of opinion. It has, however, been proved that the death-rate enormously expands in foggy weather, and the Hon. Rollo Russell has made a careful calculation showing the extra cost which the smoke nuisance annually imposes upon London. The figure at which he has arrived is £5,470,000, including damage to buildings, fabrics and works of art.

The amount of coal consumed each year in the country was calculated by the Royal Commission on coal supplies to amount to 160,000,000 tons, of which 36,000,000 or 19·2% are consumed for domestic purposes, and 53,000,000 tons are used in ordinary factories. Thirteen million tons are taken by railways, 15,000,000 by gasworks and 28,000,000 tons by the iron and steel industries.

The methods that have been suggested for the abolition of smoke may be divided into two great classes, viz. those that seek to attain this end by improving the appliances for the burning of bituminous coal, and those that propose to abolish its use and substitute for it some other kind of fuel. The proposals of the first class may be divided into those applicable to domestic purposes and those applicable to boiler fires and other large-scale operations. Those of the second class may be divided according to the nature of the fuel which they suggest. The innumerable inventions of the first class depend for their success (so far as they are successful) on the attention bestowed on the scientific requisites for complete combustion, viz. a sufficient but not too great supply of air, the thorough admixture of this air with the products of the destructive distillation of the coal, and the maintenance of a high temperature within the fire. In the old and crude methods the facts which most militate against the attainment of these desiderata are—(1) that large masses of fresh fuel are thrown on at the top, which cool down the fire where the highest temperature is required; (2) that the products of the distillation of this fresh fuel, heated from below, do not get properly mixed with air till they have been drawn up the chimney; (3) that unduly large volumes of cold air are continually being sucked up through the fire, cooling it and carrying its heat away from where it is wanted, and yet without remedying the second evil. In the improved methods regularity of supply of both fuel and air is sought so as to maintain a steady evolution of distillation products, a steady temperature, and a steady and complete combustion. In many cases it is sought to warm fresh air before it enters the room by a regenerative system, the heat being taken from the escaping gases which would otherwise carry it up the chimney; and in some cases the air which feeds the fire is heated in the same way.

Tests applied at the South Kensington Exhibition of 1882 and in recent years by the Coal Smoke Abatement Society acting in conjunction with the Office of Works, for domestic grates and stoves, have included a chemical examination of the chimney gases, observations of the "smoke-shade" as indicating the proportion of unburnt carbon, and a record of the amount of coal burnt, of the rise of temperature produced, of the radiation, and of the amount of heat lost by being carried away through the chimney. Domestic grates and stoves are divided into six classes:—(1) open grates having ordinary bottom grids and upward draught; (2) open grates having solid floors (adapted for "slow combustion") and upward draught; (3) open grates fed from below, supplied with fresh fuel beneath the incandescent fuel; (4) open grates fed from the back or from the sides or from hoppers; (5) open grates having downward or backward or lateral draught; (6) close stoves. Each of these classes is subdivided according as the apparatus is "air-heating" or "non-air-heating," *i.e.* according as an attempt is or is not made to save heat on the regenerative principle. The following conclusions, among others, have been arrived at:—(*a*) the air-heating principle has not been applied with success except in class 5; (*b*) close stoves (class 6) are superior to open grates (total average of classes 1-5) in respect of freedom from smoke and of general heating effect, but they are greatly inferior in radiating power; (*c*) the "slow-combustion" principle gives a high radiation factor, with a lower consumption of fuel, but is otherwise not successful; (*d*) the class of air-heating grates with downward, backward, or lateral draughts and with a large surface of fire-brick for radiating heat is, on the whole, most efficient (see HEATING).

In boiler fires, both for locomotives and for fixed appliances, the desiderata are essentially the same as in the case of domestic fires; the principles involved are consequently also the same, though the appliances are necessarily different. These improvements may be all classed under one or other of two heads, according as the mode of supplying the fuel or the mode of supplying the air is the subject of the improvement. These two kinds of improvement may of course be combined.

In the old forms of furnace fresh fuel, as it is wanted, is supplied by hand labour, the furnace doors being opened and large quantities of coal thrown in. One result of this is the inrush of great volumes of cold air, which, aided by the equally cold fuel, lowers the general temperature of the furnace. Mechanical stokers meet this difficulty by supplying the coal regularly in small quantities at a time. They may be divided into "coking" stokers, which deliver the coal at the front and gradually push it backward; "sprinkling" stokers, which scatter it generally over the surface of the grate; and "underfeed" stokers, which raise it from below so that the products of its distillation pass through the already incandescent fuel. The mechanism by which these results are attained is often of a complex nature.

It is generally recognized that air cannot be efficiently supplied to the furnace if admitted only in front, and accordingly many plans have been devised for supplying it also at the back and sides. In some cases currents of air are induced by steam-jets; but this plan has not always proved successful. The inventions on the regenerative principle are more generally satisfactory. In them the air, before entering the furnace, is made to circulate through chambers heated externally by the products of combustion, and, having thus acquired a high temperature and absorbed heat that would otherwise have been lost, is admitted through openings at the bridge. Many of these appliances are almost absolutely smokeless, and they are much in use, as they have been shown to effect great economy in coal consumption.

It must not be forgotten, however, that with the use of trained stokers a high degree of boiler efficiency is reached by hand-firing alone. Indeed, it has been proved by actual tests that, when pitted against untrained men, skilled stokers have raised the thermal efficiency of their plant by over 16%, without creating smoke nuisances. In Germany stokers are trained under careful state supervision, and similar work has been started at the Borough Polytechnic Institute by the London County Council.

The advocates of the total or partial disuse of smoke-producing coals are variously in favour of anthracite, coke, electric power, liquid fuel or gas.

In some factories, such as malting works, anthracite and other coals containing a high percentage of carbon may be and have long been advantageously used as fuel. They yield a much smaller percentage of distillation products than ordinary coals, and produce no smoke or almost none. But they are difficult to ignite, and in small fires difficult to keep burning without forced draught; they give very little flame, and are comparatively expensive, so that they are under considerable disadvantage as compared with the usual kinds of coal. Many grates and stoves have been devised for burning anthracite for domestic heating, and some of them are successful and economical; but, in view of the national prejudice in favour of a bright and open fire, it is not likely that anthracite will ever replace bituminous coal to any great extent in the British Isles, where the great coal-fields undoubtedly are the natural sources of fuel.

This remark, however, does not apply to the use of coke and of gas, which are themselves made from coal. Coke is produced in large quantities, both for its own sake and as a by-product in the manufacture of gas for lighting purposes, and is largely used in various kinds of furnaces. It gives no smoke, but it resembles anthracite also in being but ill adapted for use in open grates on account of the difficulty of ignition and the absence of flame.

One of the most notable features of the smoke abatement movement in recent years has been the manufacture of smokeless fuels capable of being readily and satisfactorily burnt in ordinary household grates. The use of such fuels is growing and will, in conjunction with the enormous expansion in the use of gas-cookers and heating appliances, do much to eliminate smoke nuisances from private houses. Over 750,000 gas-cookers are in use in the metropolis alone, and their aggregate effect in preventing the emission of smoke from kitchen chimneys must be very great.

Liquid fuel or natural petroleum, which has come into exceptional prominence during recent years as a heating agent, owes its success to its relatively smokeless combustion and high efficiency. The same applies to gaseous fuel, which includes in addition to ordinary coal gas other mixtures of gases which burn with a high heating value and with no deleterious vapours or smoke (see FUEL: *Liquid* and *Gaseous*). Electricity is now also being largely utilized in factories for power purposes, and is thus bearing its share in solving the problem of smoke abatement.

Nicholson, *Smoke Abatement* (1905); also the publications of the London Coal Smoke Abatement Society; Booth and Kershaw, *Smoke Prevention and Fuel Economy* (1904); *Reports of the Laws in certain Foreign Countries in regard to Emission of Smoke from Chimneys* (Foreign Office Return), Cd. 2347 (1905); *London Fog Inquiry* (1901–1902) (Reports to and by the Meteorological Council).

(O. M.; L. W. CH.)

SMOLENSK, a government of middle Russia, belonging partly to Great Russia and partly to White Russia, bounded by the governments of Moscow and Kaluga on the E., Orel and Chernigov on the S., Mogilev and Vitebsk on the W., and Pskov and Tver on the N. It covers an area of 21,632 sq. m. in the W. of the great central plateau, its N. districts extending towards the hilly region of the Valdai. The rivers being deeply cut in the plateau, the surface is also hilly in the W. districts (Smolensk, Dorogobuzh), whence it slopes away gently towards vast plains on the E. and S. Carboniferous limestones, containing a few deposits of coal (in Yukhnov) and quarried for building purposes, occupy the E. of Smolensk; chalk appears in the S. extremity; while tertiary sands, marls and ferruginous clays cover all the W. The whole is overlain with a thick sheet of boulder clay, with irregular extensions to the N.; post-tertiary sands are spread over wide surfaces; and peat-bogs fill the marshy depressions. The soil, mostly clay, is generally unfertile, and stony and sandy in several districts. The rivers Vazuza and Gzhat, both flowing into the Volga, and the Moskva and the Ugra, tributaries of the Oka, are channels for floating timber. The two tributaries of the Dvina—the Kasplya and the Mezha—are of much more importance, as they and their affluents carry considerable numbers of boats to Riga. The Dnieper takes its origin in Smolensk and drains it for more than 300 m.; but neither this river nor its tributaries (Vop, Vyazma, Sozh and Desna), whose upper courses belong to Smolensk, are navigable; timber only is floated down some of them. Many small lakes and extensive marshes occur in the N.W. More than one-third of the area is under forests. The climate is like that of middle Russia generally, although the moderating influence of the damp climate of W. Europe is felt to some extent. The average yearly temperature at the city of Smolensk is 45·5° Fahr. (January, 13·5°; July, 67·2°).

The estimated population in 1906 was 1,762,400. It is chiefly composed of White Russians (55%) in the W., and Great Russians (43%) in the E. Most of the inhabitants (98%) belong to the Orthodox Greek Church; the rest are Nonconformists. The government is divided into twelve districts, the chief towns of which are Smolensk, Byelyi, Dorogobuzh, Dukhovshina, Elnya, Gzhatsk, Krasnyi, Poryechie, Roslavl, Sychevka, Vyazma and Yukhnov.

Notwithstanding the unproductive soil and the frequent failures of crops (especially in the N.W.), the chief occupation is agriculture. Out of the total area $38\frac{1}{2}$% is held by the village communities, 52% by private persons and $2\frac{1}{2}$% by the crown; 7% is uncultivable. Nearly 30% of the surface is arable land, and over 20% is under meadows. The principal crops are rye, wheat, oats, barley, buckwheat and potatoes. Grain has to be imported. Improved agricultural implements are beginning to be manufactured within the government, and to be used by the landlords, and partly also by the peasants. Flax and hemp are important crops, and some tobacco is grown. The live stock of the peasantry suffer from a want of meadow and pasture land, which is chiefly in private ownership. The peasantry are mostly very poor, in consequence not only of the French invasion in 1812, the effects of which are still felt, but also of insufficient allotments and want of meadows. In the way of mining phosphorite only is extracted. The most important industries are cotton, oil and paper mills, distilleries and breweries. The timber trade and boat-building are important sources of income, but more than one-half of the male population of west Smolensk leave their homes every year in search of work, principally as navvies throughout Russia. A lively traffic is carried on on the rivers, principally the Kasplya, the Obzha and the Ugra, corn, hemp, hempseed, linseed and especially timber being shipped. A considerable quantity of corn is imported into the W. districts.

Smolensk is crossed by two important railways, from Moscow to Warsaw and from Riga to Saratov; a branch line connects Vyazma with Kaluga. (P. A. K.; J. T. Be.)

SMOLENSK, a town of Russia, capital of the government of the same name, on both banks of the Dnieper, at the junction of the railways from Moscow to Warsaw and from Riga to Orel, 252 m. by rail W.S.W. of Moscow. Pop. (1900) 57,405. The town, with the ruins of its old kreml, or citadel, is built on high crags on the left bank of the Dnieper. Its walls, built during the reign of Boris Godunov (1598–1605), are rapidly falling into decay. But the city has much improved of late years. It has monuments in commemoration of the war of 1812 and of the Russian musical composer, M. I. Glinka (1885). It has three public libraries, an historical and archaeological museum, a people's palace, and several scientific societies. The cathedral was erected in 1676–1772, on the site of a more primitive building (dating from 1101), which was blown up in 1611 by the defenders of the city during a siege by the Poles. The picture of the Virgin brought to Russia in 1046, and attributed to St Luke, which is kept in this cathedral, is much venerated throughout central Russia. Two other churches, built in the 13th century, have been spoiled by recent additions. Smolensk is neither a commercial nor a manufacturing centre.

Smolensk is one of the oldest towns of Russia, and is mentioned in Nestor's *Chronicle* as the chief town of the Slav tribe of the Krivichis, situated on the great commercial route "from the Varyaghs to the Greeks." It maintained a lively traffic with Constantinople down to the 11th century, when the principality of Smolensk included Vitebsk, Moscow, Kaluga and parts of the present government of Pskov. The princes of Kiev were often recognized as military chiefs by the *vyeche* (council) of Smolensk, who mostly preferred Mstislav and his descendants and Rostislav, son of Mstislav, became the ancestor of a series of nearly independent princes of Smolensk. From the 14th century these fell under the influence of the Lithuanian rulers, and in 1408 Smolensk was annexed to Lithuania. In 1449 the Moscow princes renounced their claims upon Smolensk; nevertheless this important city, with nearly 100,000 inhabitants, was a constant source of contention between Moscow and Lithuania. In 1514 it fell under Russian dominion; but during the disturbances of 1611 it was taken by Sigismund III. of Poland, and it remained under Polish rule until 1654, when the Russians retook it. In 1686 it was definitely annexed to Russia. In the 18th century it played an important part as a basis for the military operations of Peter the Great during his wars with Sweden. In 1812 it was well fortified; but the French, after a two days' battle, defeated the Russians here and took the city, when it suffered much.

SMOLENSKIN, PEREZ [Peter] (1842–1885), Russian Jewish novelist, was born near Mogilev (Russia) in 1842; he died at Meran (Austria) in 1885. His story is the Odyssey of an erring son of the Ghetto. He joined and left the opposite parties of the rationalists and the mystics, and followed a variety of precarious occupations. He settled in Odessa, where he familiarized himself with several European languages, and became an antinomian in religion, though he never left the Jewish fold. He became the rallying-point for the revolt of young Jewry against medievalism, the leader, too, in a new movement towards Jewish nationalism. His Hebrew periodical, the *Dawn* (*Ha-shaḥar*), exercised a powerful influence in both directions. Shortly before his death he became deeply interested in schemes for the colonization of Palestine, and was associated with Laurence Oliphant. Smolenskin was the first to dissociate Messianic ideals from theological concomitants. Smolenskin's literary fame is due to his Hebrew novels. He may be termed the Jewish Thackeray. In style and method his work resembles that of the English novelist. There is little doubt but that Smolenskin, had he written in any language but Hebrew, would be regarded as one of the great novelists of the 19th century. Of his novels only the best need be named here. *A Wanderer on the Path of Life* (*Ha-to'eh be-darkhe ha-Ḥayim*) is the story of an orphan, Joseph, who passes through every phase of Ghetto life; the work (1868–1870) is an autobiography, the form of which was suggested by *David Copperfield*, but there is no similarity to the manner of Dickens. More perfect in execution is the *Burial of the Ass* (*Qeburath Ḥamor*) which appeared in 1874. A third novel, *The Inheritance* (*Ha-yerushah*), issued in 1880–1881, depicts life in Odessa and Rumania.

See N. Slouschz, *The Renascence of Hebrew Literature*, chs. ix., x., xi. (I. A.)

SMOLLETT, TOBIAS GEORGE (1721–1771), British novelist, was born in the old grange of Dalquhurn, near Bonhill, in the vale of Leven, parish of Cardross, Dumbartonshire, and was christened on the 19th of March 1721. His father Archibald (youngest son of Sir James, the laird of Bonhill, a zealous Whig judge and promoter of the Union of 1707) had made what was deemed in the family an improvident marriage. Archibald died in 1723, and Sir James did what he could for the widow and her family during his lifetime. The elder son James was sent into the army. Tobias was sent to Dumbarton school, then in excellent repute under the grammarian John Love. When the grandfather died in 1731 there was no further provision, and after qualifying for a learned profession at Glasgow University, Tobias was apprenticed in 1736 for five years to a well-known surgeon in that city. This early "deception" conspired to make him angry, resentful and suspicious of motive; but he was neither vindictive nor ungenerous. If his tendency to satire and caricature made him enemies, his enthusiasm for Scottish history made him friends, and, in spite of peccadilloes, the "bubbly-nosed callant with a stane in his pouch," as Dr Gordon called him, seems as an apprentice to have won his master's regard. The lad's ambition would not allow him to remain in Glasgow. The example of Thomson and Mallet was contagious, and at the age of eighteen Smollett crossed the border in set form to conquer England with a tragedy, *The Regicide*, based on Buchanan's description of the death of James I.

The story of the journey is told with infinite spirit in the early chapters of *Roderick Random*. The failure of the play, his darling composition and certainly the worst thing he ever wrote, became the stock grievance of Smollett's life. For some months no one could be induced to read it, and the unrequited author would have been reduced to starvation had not a friend of the family procured him the position as surgeon's mate on H.M.S. "Cumberland." The fleet was ordered to attack Cartagena, the great stronghold of Spanish America, and the siege, which occupied most of the year 1741, proved the Walcheren expedition of the 18th century. Smollett as an eye-witness has left us a memorable picture of the miseries endured by soldiers and sailors, which historians have been content to accept as a first-hand authority in spite of the fact that it is embedded in the pages of a licentious novel. When the enterprise was abandoned the fleet returned to Jamaica. There Smollett fell in love with the daughter of a planter, Nancy Lascelles, whom he married on returning to England. Before this, having removed his name from the navy books (May 1744), he had set up as a surgeon in Downing Street; but he attracted attention more as a wit than as a leech. "Jupiter" Carlyle testifies to his brilliant accomplishments, and to the popularity he attained by his indignant verses "The Tears of Scotland," resenting Culloden. In the same year (July 1746) his name appeared upon the title-page of a political satire entitled *Advice*, followed characteristically in 1747 by *Reproof*, both of them "imitations from Juvenal" in the manner of Pope. He revenges himself in his satires on the should-have-been patrons of his play.

Disappointed alike in the drama, his profession and his wife's dowry, Smollett devoted his attention in a happy hour to fictitious adventure. Richardson had published the first part of *Pamela* in 1741, and Fielding his *Joseph Andrews* in 1742. But Smollett owed less to these models than to his studies in Cervantes, Swift, Defoe and above all Le Sage. His hero, who gives his first novel its capital name, *Roderick Random*, recounts like Gil Blas a life of varied adventure in the company of a servant, in which he enters the service of a physician and meets with old schoolfellows, thieves, notes of the bank of engraving, prison, semi-starvation and in the end an unexpected fortune. The author draws on his adventures on the English highway and in the cockpit of a king's ship. Virtually he revealed the seaman to the reading world—divined his character, sketched his outlines, formulated his lingo, discovered his possibilities to such purpose that, as Scott says, every one who has written about the navy since seems to have copied more from Smollett than from nature. Pungent observation allied to a vigorous prose, emancipated to a rare degree from provincialism or archaism, were perhaps the first of Smollett's qualifications as a novelist. Such coherence as his novels have owes more to accidental accumulation than to constructive design. The wealth of amusing incident, the rapidly moving crowd of amusing and eccentric figures, atones for a good many defects. Smollett's peculiar coarseness and ferocity were gradually eliminated from English fiction, but from *Tom Jones* right down to *Great Expectations* his work was regularly ransacked for humour. There was no author's name on the title of the two small volumes of *Random*; Lady Mary Wortley Montagu thought a work so delightful could only be by Fielding, in whose name it was actually translated into French. But Smollett made no secret of the authorship, went to Paris to ratify his fame, and published his derelict play as " by the author of *Roderick Random*," hoping thus, as he said, to intimidate his discarded patrons. The incident well reveals the novelist's " systema nervosum maxime irritabile," of which his medical advisers spoke.

Smollett now became a central figure among the group of able doctors who hailed from north of the Tweed, such as Clephane, Macaulay, Hunter, Armstrong, Pitcairne and William Smellie, in the revision of whose system of Midwifery the novelist bore a part. He must have still designed to combine medicine with authorship, for in June 1750 he obtained the degree of M.D. from Marischal College, Aberdeen. But in the autumn of this year he already had another novel in prospect, and went over to Paris with a new acquaintance, Dr Moore (author of *Zeluco*), who soon became his intimate and was destined to become his biographer. The influence of this visit is marked in Smollett's second novel, *The Adventures of Peregrine Pickle* (4 vols., 1751). Like its predecessor, a loosely constructed string of episodes and adventures in which a still greater scope is afforded to the author for eccentric display, *Pickle* proved from the first a resounding success, both in England and France. The chief centres of attraction are the grotesque misanthrope of Bath, Cadwallader Crabtree, the burlesque scenes afforded by the physician (a caricature of Akenside) and Pallet the painter in Paris, and the so-called " garrison," with its inhabitants, Hatchway and Pipes and the inimitable Trunnion—whose death-scene fully exhibits Smollett's powers for the first time—the prototype of so many character portraits from Uncle Toby to Cap'n Cuttle. Trunnion's grotesque ride to church reappears in John Gilpin; the misanthrope, practising satire under cover of feigned deafness, reappears in the Mungo Malagrowther of Scott, who frankly admits further debts to Smollett in the preface to the *Legend of Montrose*. The " garrison " unquestionably suggested the " castle " of Tristram Shandy and the " fortress " of Mr Wemmick. Indeed it is no exaggeration to say that the tideway of subsequent fiction is strewn on every hand with the *disjecta membra* of Smollett's happy phrases and farcical inventions. Pickle himself is if possible a bigger ruffian than Random; in this respect at any rate Smollett clings to the cynical tradition of the old romances of roguery. The novel is marred to an even greater extent by interpolations and personal attacks than its predecessor; the autobiographical element is slighter and the literary quality in some respects inferior.

Smollett's third novel, *Ferdinand Count Fathom*, appeared in 1753, by which time the author, after a final trial at Bath, had definitively abandoned medicine for letters, and had settled down at Monmouth House, Chelsea, a married man, a father and a professional writer, not for patronage, but for the trade. In this capacity he was among the first to achieve a difficult independence. In *Fathom* Smollett endeavours unquestionably to organize a novel upon a plan elevated somewhat above mere agglomeration. It looks as if he had deliberately set himself to show that he too, as well as the author of *Tom Jones*, could make a plot. The squalor and irony of the piece repel the reader, but it is Smollett's greatest feat of invention, and the descriptive power, especially in the first half, reveals the latent imaginative power of the author. Few novels have been more systematically plundered, for *Fathom* was the studio model of all the mystery and terror school of fiction commencing with Radcliffe and Lewis. With *Fathom* the first jet of Smollett's original invention was spent. The novel was not particularly remunerative, and his expenses seem always to have been profuse. He was a great frequenter of taverns, entertained largely, and every Sunday threw open his house and garden to unfortunate " brothers of the quill," whom he regaled with beef, pudding and potatoes, port, punch and " Calvert's entire butt-beer."

To sustain these expenses Smollett consented to become a literary impresario upon a hitherto unparalleled scale. His activity during the next six years was many-sided, chiefly in the direction of organizing big and saleable " standard " works for the booksellers and contracting them out to his " myrmidons." Thus we see him almost simultaneously editing *Don Quixote*, making a triumphant visit to Scotland, inaugurating a new literary periodical the *Critical* (Feb. 1756) by way of corrective to Griffith's *Monthly Review*, organizing a standard library *History of England* in quarto and octavo, with continuations, and a seven-volume compendium of *Voyages*, for which he wrote a special narrative of the siege of Cartagena, supplementary to his account in *Roderick Random*. In 1758 he projected and partly wrote a vast *Universal History*, and in January 1760 he brought out the first number of a new sixpenny magazine, the *British*, to which he contributed a serial work of fiction, the mediocre *Adventures of Sir Launcelot Greaves*. By these Herculean labours as a compiler Smollett must have amassed a considerable sum, to which the £200 received from the now forgiven " Marmozet " (Garrick) for the sixth performance of the patriotic extravaganza, *The Reprisal, or the Tars of Old England*, must have come as a welcome addition. The *Critical Review* was already responsible for plenty of thorns in the editorial cushion when in 1762 Smollett undertook the additional task of editing the *Briton*. He had already been ridiculed, insulted, fined and imprisoned in the Marshalsea (this last for an attack on Admiral Sir Charles Knowles). He was now to support the North British favourite of George III. in the press against all comers, not we may reasonably suppose without substantial reward. Yet after incurring all this unpopularity, at a time when the London mob was more inflamed against Scotsmen than it has ever been before or since, and having aroused the animosity of such former allies as Wilkes and his friend Churchill, Smollett was to find himself unceremoniously thrown over by his chief, Lord Bute, on the ground that his paper did more to invite attack than to repel it.

The *Briton* expired or was killed by the *North Briton* in February 1763, and for the moment Smollett allowed himself to be beckoned back by the booksellers to such tasks as a universal gazetteer and a translation of Voltaire in 38 volumes, and we hear of him prescribing work to his minions or receiving their homage and demanding their copy as of old. In April, however, his only daughter died at the age of fifteen, and, already over-wrought and almost broken down from sedentary strain, the tension proved too much and Smollett was never the same man again. His wife earnestly begged him to " convey her from a country where every object seemed only to nourish grief," and he followed her advice. The result was two years' sojourn abroad, mainly upon the Riviera, which Smollett, who may be termed the literary discoverer of Nice, turned to such excellent purpose in his *Travels* (2 vols., 1766), remarkable alike for their acidity and for their insight. On his arrival from Italy, where he had provided material for Sterne's portrait of the distressful " Smelfungus," Smollett seemed at first decidedly better and appeared to be getting over some of the symptoms of his pulmonic complaint. But his health was thoroughly undermined by rheumatism, and the pain arising from a neglected ulcer which had developed into a chronic sore helped to sap his strength. As soon, therefore, as the *Travels* were out of hand Smollett resolved on a summer journey to Scotland. The society of Edinburgh, then at the apogee of its brilliance, paid due attention to the famous Dr Smollett. He was visited by Hume, Home, Robertson, Adam Smith, Blair, Carlyle, Cullen and the Monros. He went to Glasgow to see Dr Moore (where he patted the head of the future hero of Coruña), and stayed with his cousin, James Smollett, in his newly built mansion of Cameron. His mother, who hardly knew his toil-worn visage until it relaxed into his old roguish smile, died in this autumn, and he was still in a precarious state of health when he proceeded to Bath, spending the Christmas of 1766 in Gay Street, where his complaint at last took a turn for the better, and where it is possible that he may have commenced a rough draft of *Humphrey Clinker.*

In 1768 he was again in London, and with a return of his vital energy came a recrudescence of the old savagery. *The History and Adventures of an Atom* is a very clever, but abominably coarse, Rabelaisian satire upon the whole conduct of public affairs in England from the beginning of the Seven Years' War down to the date of publication. He lashes out on all sides without fear or favour. The king, Chatham, Bute and North are bespattered with filth, the acridity of which owes something to Gulliver, with aid as to local colour from the Jesuit and other accounts of Japan which had come under his ken as a compiler of travels. After its publication in 1769, without other serious consequences, Smollett's health completely relapsed, and in December (a consulate in the Mediterranean having been refused him) he left England finally, and settled first at Pisa and then near Antignano, a few miles out of Leghorn. There, during the autumn of 1770, he penned his immortal *Humphrey Clinker*, in which he reverts to his favourite form of itinerant letters, a rare example of late maturity of literary power and fecundity of humour. The sardonic humour, persistent curiosity and keen faculty of observation shown in the *Travels* are here combined with the mellow contentment of the voyager who has forgotten the small worries of transport and with the enthusiasm of the veteran who revisits the scenes of his youth. The character drawing, too, though still caustic, seems riper and more matured. Smollett's speculative and informing 18th-century mind is here content for the most part, like Goldsmith's, merely to amuse.

Smollett died at Leghorn aged fifty on the 17th of September 1771, and was buried in the old English cemetery there. Three years later the Smollett obelisk was put up at Renton (it now stands in the parish school-ground), half-way between Dumbarton and Balloch. The best portrait belongs to the Smollett family, Cameron House, Loch Lomond (engraved by Freeman, 1831). The genuineness of the others, if we except that in the Hunterian Museum, Glasgow, is doubtful. The novelist has been confused with the Dr Smollett, the contemporary of Dr William Hunter, who figures in Rowlandson's "Dissecting Room" (*Royal Coll. of Surgeons Cat.*, 1900).

Hume said that Smollett was like a coco-nut, rough outside, but full of human kindness within. He was easily ruffled by the rubs of fortune of which he had more than his fair share. Hence the adjectives corrosive and splenetic so often applied to a nature essentially both generous and tender. After Fielding, Smollett counts as the greatest purveyor of comic prose-epic of contemporary life to his generation, if not to his century. Scott and Dickens regarded him as fully Fielding's equal. Hazlitt and Thackeray thought otherwise. Equally rationalist and pagan with Fielding, Smollett is more of a pedagogue and less of the instinctive scholar and wit than his predecessor. His method in its broad outlines is similar, historic and ambulant rather than philosophic or poetic, but he has more potential romance or poetry about his make-up than the mystery-hating Fielding. In the recognized requirements of prose-epic such as plot, character, scene, reflection and diction, Smollett could fairly hold his own. His prose, which carries on the robust tradition from Swift and Defoe to Johnson and Jeffrey, is more modern in tone than that of his great rival. In fictions such as *Tom Jones*, *Roderick Random* and the like, England could at length feel that it possessed compositions which might claim kinship and comparison with Cervantes and Le Sage. Much that these writers attempted has been done again in a style better adjusted to the increasing refinement of a later age. But Smollett's great powers of observation and description, his caustic and indignant turn of speech, will long render him an invaluable witness in the century which he so well represents. Much that he did was mere hackwork, but at his best he ranks with the immortals.

The estimate formed of Smollett's work during the past generation has probably been a diminishing one, as we may infer in part from the fact that there is no standard Life and no definitive edition of the works. The chief collective editions are as follows: 6 vols., Edinburgh, 1790; 6 vols., London, 1796, with R. Anderson's Memoir; *Works*, ed. J. Moore, 1797 (re-edited J. P. Browne, 8 vols., 1872); *Works*, ed. Henley and Seccombe, Constable (12 vols., 1899–1902). To which must be added a one-volume *Miscellaneous Works*, ed. Thomas Roscoe (1841); *Selected Works* (with a careful life by David Herbert) (Edinburgh, 1870); Ballantyne's edition of the Novels with Scott's judicious memoir and criticism (2 vols., 1821); and Professor G. Saintsbury's edition of the Novels (12 vols., 1895). There are short Lives by Robert Chambers (1867), David Hannay (1887) and O. Smeaton (1897). Additional information of recent date will be found in the article on Smollett in the *Dict. Nat. Biog.*, Masson's *British Novelists* (and other books on the development of English Fiction), H. Graham's *Scottish Men of Letters in the Eighteenth Century*, *Blackwood's Mag.* for May 1900; and the present writer's introduction to Smollett's *Travels through France and Italy* (World's Classics, 1907). (T. Se.)

SMUGGLING (O. Eng. *smeógan*, *smūgan*, to creep, with the idea of secrecy), a breach of the revenue laws either by the importation or the exportation of prohibited goods or by the evasion of customs duties on goods liable to duty. Legislation on the subject in England has been very active from the 14th century downwards. In the reign of Edward III. the illicit introduction of base coin from abroad led to the provision of the Statute of Treasons 1351, making it treason to import counterfeit money as the money called "Lushburgh." Such importation is still an offence, though no longer treason. After the Statute of Treasons a vast number of acts dealing with smuggling were passed, most of which will be found recited in the repealing act of 1825. In the 18th and the early years of the 19th century, smuggling (chiefly of wine, spirits, tobacco and bullion) was so generally practised in Great Britain as to become a kind of national failing. The prevalence of the offence may be judged from the report of Sir J. Cope's committee in 1732 upon the frauds on the revenue. The smuggler of the 18th century finds an apologist in Adam Smith, who writes of him as "a person who, though no doubt highly blamable for violating the laws of his country, is frequently incapable of violating those of natural justice, and would have been in every respect an excellent citizen had not the laws of his country made that a crime which nature never meant to be so." The gradual reduction of duties brought the offence in the United Kingdom into comparative insignificance, and it is now almost confined to tobacco, though the sugar duty has led to smuggling of saccharin. Most of the existing legislation on the subject of smuggling is contained in the Customs Consolidation Act 1876.

The main provisions are as follows. Vessels engaged in smuggling are liable to forfeiture and their owners and masters to a penalty not exceeding £500. Smuggled and prohibited goods are liable to forfeiture. Officers of customs have a right of search of vessels and persons. Fraudulent evasion or attempted evasion of customs duties renders the offender subject to forfeit either treble the value of the goods or £100 at the election of the commissioners of customs. Heavy penalties are incurred by resistance to officers of customs, rescue of persons or goods, assembling to run goods, signalling smuggling vessels, shooting at vessels, boats, or officers of the naval or revenue service, cutting adrift customs vessels, offering goods for sale under pretence of being smuggled, &c. Penalties may be recovered either by action or information in the superior courts or by summary proceedings. In criminal proceedings the defendant is competent and compellable to give evidence. The Merchant Shipping Act 1894 makes any seaman or apprentice, after conviction for smuggling whereby loss or damage is caused to the master or owner of a ship, liable to pay to such master or owner such a sum as is sufficient to reimburse the master or owner for such loss or damage, and the whole or a proportional part of his wages may be retained in satisfaction of this liability. Additional provisions as to smuggling are also contained in the Customs and Inland Revenue Act 1879, and the Customs and Inland Revenue Act 1881. A smuggling contract is generally illegal. But it may be valid, and the vendor may recover the price of goods, even though he knew the buyer intended them to be smuggled, unless he actually aids in the smuggling so as to become *particeps criminis*. Contracts to defraud the revenue of a foreign state are, according to English decisions, not illegal. There is a German decision, more consonant with international morality, to the opposite effect.

The penalties for smuggling in the United States will be found mainly in tit. xxxiv. ch. 10 of the Revised Statutes. The seaman guilty of smuggling is liable to the same penalty as in England, and in addition to imprisonment for twelve months, s. 4596.

See Stephen Dowell's *History of Taxation* (2nd ed., 1888), and Luke Owen Pike's *History of Crime in England* (1873–1876); and for general accounts of smuggling see W. D. Chester, *Chronicles of the Customs Department* (1885); H. N. Shore, *Smuggling Days and Smuggling Ways* (1892); Alton and Holland, *The King's Customs* (1908); C. G. Harper, *The Smugglers: Picturesque Chapters in the Story of an Ancient Craft* (1909).

SMYBERT (or Smibert), **JOHN** (1684–1751), Scottish American artist, was born at Edinburgh in 1684, and died in Boston, Massachusetts, in 1751. He studied under Sir James Thornhill, and in 1728 accompanied Bishop Berkeley to America, with the intention of becoming professor of fine arts in the college which Berkeley was planning to found in Bermuda. The college, however, was never established, and Smybert settled in Boston, where he married in 1730. In 1731 he painted "Bishop Berkeley and His Family," now in the dining-hall, Yale University, a group of eight figures. He painted portraits of Jonathan Edwards and Judge Edmund Quincy (in the Boston Art Museum), Mrs Smybert, Peter Faneuil and Governor John Endecott (in the Massachusetts Historical Society), John Lovell (Memorial Hall, Harvard University), and probably one of Sir William Pepperrell; and examples of his works are owned by Harvard and Yale Universities, by Bowdoin College, by the Massachusetts Historical Society, and by the New England Historical and Genealogical Society. A son, Nathaniel Smybert (1734–1756), was born in Boston on the 20th of January 1734, and died there on the 8th of November 1756. He was a pupil of his father, and dying at the age of twenty-two, left several important canvases, notably a portrait of Dorothy Wendell (in the Collection of Dr John L. Hale, Boston).

SMYRNA (*Ismir*), in ancient times one of the most important and now by far the greatest of the cities of Asia Minor, has preserved an unbroken continuity of record and identity of name from the first dawn of history to the present time.

1. *The Ancient City.*—It is said to have been a Lelegian city before the Greek colonists settled in Asia Minor. The name, which is said to be derived from an Amazon called Smyrna, is indubitably Anatolian, having been applied also to a quarter of Ephesus, and (under the cognate form Myrina) to a city of Aeolis, and to a tumulus in the Troad. The Aeolic settlers of Lesbos and Cyme, pushing eastwards by Larissa and Neonteichus and over the Hermus, seized the valley of Smyrna. It was the frontier city between Aeolis on the N. and Ionia on the S., and was more accessible on the S. and E. than on the N. and W. By virtue of its situation it was necessarily a commercial city, like the Ionian colonies. It is therefore not surprising that the Aeolic element grew weaker; strangers or refugees from the Ionian Colophon settled in the city, and finally Smyrna passed into the hands of the Colophonians and became the thirteenth of the Ionian states. The change had taken place before 688, when the Ionian Onomastus of Smyrna won the boxing prize at Olympia, but it was probably then a recent event. The Colophonian conquest is mentioned by Mimnermus (before 600 B.C.), who counts himself equally a Colophonian and a Smyrnaean. The Aeolic form of the name, Σμύρνα, was retained even in the Attic dialect, and the epithet "Aeolian Smyrna" remained long after the conquest. The situation of Smyrna on the path of commerce between Lydia and the west raised it during the 7th century to the height of power and splendour. It lay at the head of an arm of the sea, which reached far inland and admitted the Greek trading ships into the heart of Lydia. One of the great trade routes which cross Anatolia descends the Hermus valley past Sardis, and then diverging from the valley passes S. of Mt Sipylus and crosses a low pass into the little valley, about 7 m. long and 2 broad, where Smyrna lies between the mountains and the sea. Miletus, and later Ephesus, situated at the sea end of the other great trade route across Anatolia, competed for a time successfully with Smyrna, but both cities long ago lost their harbours and Smyrna remains without a rival.

When the Mermnad kings raised the Lydian power and aggressiveness Smyrna was one of the first points of attack. Gyges (*c.* 687–652) was, however, defeated on the banks of the Hermus; the situation of the battlefield shows that the power of Smyrna extended far to the E., and probably included the valley of Nymphi (Nif). A strong fortress, the ruins of whose ancient and massive walls are still imposing, on a hill in the pass between Smyrna and Nymphi, was probably built by the Smyrnaean Ionians to command the valley of Nymphi. According to Theognis (about 500 B.C.), "pride destroyed Smyrna." Mimnermus laments the degeneracy of the citizens of his day, who could no longer stem the Lydian advance. Finally, Alyattes III. (609–560) conquered the city, and Smyrna for 300 years lost its place in the list of Greek cities. It did not cease to exist, but the Greek life and political unity were destroyed, and the Smyrnaean state was organized on the village system (ᾤκεῖτο κωμηδόν). It is mentioned in a fragment of Pindar, about 500 B.C., and in an inscription of 388 B.C. A small fortification of early style, rudely but massively built, on the lowest slope of a hill N. of Burnabat, is perhaps a fortified village of this period. Alexander the Great conceived the idea of restoring the Greek city; the two Nemeses who were worshipped at Smyrna are said to have suggested the idea to him in a dream. The scheme was, according to Strabo, carried out by Antigonus (316–301), and Lysimachus enlarged and fortified the city (301–281). The acropolis of the ancient city had been on a steep peak about 1250 ft. high, which overhangs the N.E. extremity of the gulf; its ruins still exist, probably in much the same condition as they were left by Alyattes. The later city was founded on the modern site partly on the slopes of a rounded hill called Pagus near the S.E. end of the gulf, partly on the low ground between the hill and the sea. The beauty of the city, clustering on the low ground and rising tier over tier on the hillside, is frequently praised by the ancients and is celebrated on its coins.

The "crown of Smyrna" seems to have been an epithet applied to the acropolis with its circle of buildings. Smyrna is shut in on the W. by a hill now called Deirmen Tepe, with the ruins of a temple on the summit. The walls of Lysimachus crossed the summit of this hill, and the acropolis occupied the top of Pagus. Between the two the road from Ephesus entered the city by the "Ephesian gate," near which was a gymnasium. Closer to the acropolis the outline of the stadium is still visible, and the theatre was situated on the N. slopes of Pagus. The line of the walls on the E. side is unknown; but they certainly embraced a greater area than is included by the Byzantine wall, which ascends the castle hill (Pagus) from the Basmakhanē railway station. Smyrna possessed two harbours—the outer, which was simply the open roadstead of the gulf, and the inner, which was a small basin, with a narrow entrance closed by a rope in case of need, about the place now occupied by bazaars. The inner harbour was partially filled up by Timur in 1402, but it had not entirely disappeared till the beginning of the 19th century. The modern quay has encroached considerably on the sea, and the coast-line of the Greek time was about 90 yds. farther S. The streets were broad, well paved and laid out at right angles; many were named after temples: the main street, called the Golden, ran across the city from W. to E., beginning probably from the temple of Zeus Akraios on the W. side of Pagus, and running round the lower slopes of Pagus (like a necklace on the statue, to use the favourite terms of Aristides the orator) towards Tepejik outside the city on the E., where probably the temple of Cybele, the Metroön, stood. Cybele, worshipped under the name of Meter Sipylene, from Mt Sipylus, which bounds the Smyrna valley on the N., was the tutelar goddess of the city. The plain towards the sea was too low to be properly drained and hence in rainy weather the streets were deep with mud and water.

The river Meles, which flowed by Smyrna, is famous in literature and was worshipped in the valley. The most common and consistent tradition connects Homer with the valley of Smyrna and the banks of the Meles; his figure was one of the stock types on Smyrnaean coins, one class of which was called Homerian; the epithet "Melesigenes" was applied to him; the cave where he was wont to compose his poems was shown near the source of the river; his temple, the Homereum, stood on its banks. The steady equable flow of the Meles, alike in summer and winter, and its short course, beginning and ending near the city, are celebrated by Aristides and Himerius. The description applies admirably to the stream which rises from abundant fountains, now known as Diana's bath, E. of the city, and flows into the S.E. extremity of the gulf. The belief that the torrent, almost dry except after rains, which flows by Caravan bridge, is the ancient Meles, flatly contradicts the ancient descriptions.

In the Roman period Smyrna was the seat of a *conventus* which included S. Aeolis and great part of the Hermus valley. It vied with Ephesus and Pergamum for the title "First (city) of Asia." A Christian church existed here from a very early time, having its origin in the considerable Jewish colony. Polycarp was bishop of Smyrna and was martyred there A.D. 155. The bishops of Smyrna were originally subject to the metropolitan of Ephesus; afterwards they became independent (*αὐτοκέφαλοι*), and finally were honoured with metropolitan rank, having under them the bishops of Phocaea, Magnesia ad Sipylum, Clazomenae, Sosandrus (Nymphi?), Archangelus (Temnos?) and Petra (Menemen?).

When Constantinople became the seat of government the trade between Anatolia and the W. lost in importance, and Smyrna declined apace. A Turkish freebooter named Tsacha seized Smyrna in 1084, but it was recovered by the generals of Alexius Comnenus. The city was several times ravaged by the Turks, and had become quite ruinous when the emperor John Ducas Vatatzes about 1222 rebuilt it. But Ibn Batuta found it still in great part a ruin when the famous chieftain Aidin had conquered it about 1330 and made his son Amur governor. It became the port of the Aidin amirate. Soon afterwards the Knights of Saint John established themselves in the town, but failed to conquer the citadel. In 1402 Timur stormed the town and massacred almost all the inhabitants. The Mongol conquest was only temporary, but Smyrna was resumed by the Seljuks of Aidin and has remained till the present day in Mahommedan hands. Until the reign of Abdul Mejid it was included for administrative purposes in the *eyalet* of Jezair (the Isles) and not in that of Anadoli. The representative of the Capitan Pasha, who governed that *eyalet*, was, however, less influential in the city than the head of the Kara Osman Oglu's of Manisa (see MANISA). From the early 17th century till 1825, Smyrna was the chief provincial factory of the British Turkey Company, as well as of French, Dutch and other trading corporations. The passages with gates at each end within which most Frank shops in modern Smyrna lie, are a survival of the semi-fortified residences of the European merchants.

2. *The Modern City*, capital of the Aidin vilayet, and the most important town of Asia Minor. Pop. more than 250,000, of which fully a half is Greek. It is one of the principal ports of the Ottoman empire, and has a large trade, of which the greater part is with Great Britain. The chief items of export are figs, tobacco, valonia, carpets, raisins and silk, to the value of some three million sterling. The imports are estimated at a million more. About 7000 steamships visit the port annually. Until 1894 the two railways from Smyrna to the interior belonged to British companies; but in 1897 the Smyrna-Alashehr line passed into the hands of a French syndicate, which completed an extension to Afium Kara-hissar and virtually (though not actually) effected a junction with the Anatolian railway system. This line has branches to Burnabat and Soma. The Smyrna-Aidin line has been extended to Dineir, and powers have been obtained to continue to Isbarta and Egerdir. It has branches to Buja, Seidikeui, Tireh, Odemish, Sokia, Denizli and Ishekli.

Modern Smyrna is in all but government a predominantly Christian town (hence the Turks know it as *giaour Ismir*). There is a large European element (including about 800 British subjects), a great part of which lives in two suburban villages, Burnabat and Buja, but has business premises in the city. The European and Greek quarters rapidly increase, mainly to the N.; while the fine quays, made by a French company, are backed by a line of good buildings. The streets behind, though clean and well kept, are very narrow and tortuous. A fine new *Konak* (government offices) has been built, and another important new structure is the pier of the Aidin Railway Co. at Point. The development of this railway is the most conspicuous sign of progress.

Smyrna is a headquarters of missions of all denominations and has good schools, of which the International College is the best. There is a British consul-general, with full consular establishment, including a hospital.

See general authorities for *Asia Minor*, especially the travellers, almost all of whom describe Smyrna. Also B. F. Slaars, *Étude sur Smyrne* (1868); and W. M. Ramsay, *Letters to the Seven Churches* (1904) and article in Hastings's *Dict. of the Bible* (1902).

(W. M. RA.; D. G. H.)

SMYTH, CHARLES PIAZZI (1819–1900), British astronomer, was born at Naples on the 3rd of January 1819. He was called Piazzi after his godfather, the Italian astronomer of that name, whose acquaintance his father, Admiral Smyth, had made at Palermo when on the Mediterranean station. His father subsequently settled at Bedford and equipped there an observatory, at which Piazzi Smyth received his first lessons in astronomy. At the age of sixteen he went out as assistant to Sir Thomas Maclear at the Cape of Good Hope, where he observed Halley's comet and the great comet of 1843, and took an active part in the verification and extension of La Caille's arc of the meridian. In 1845 he was appointed astronomer royal for Scotland and professor of astronomy in the university of Edinburgh. Here he completed the reduction, and continued the series, of the observations made by his predecessor, Thomas Henderson (see *Edinburgh Observations*, vols. xi.-xv.). In 1856 he made experimental observations on the Peak of Teneriffe with a view to testing the astronomical advantages of a mountain station. The Admiralty made him a grant of £500 for the purpose, and a yacht—the "Titania"—of 140 tons and a fine $7\frac{1}{2}$ in. equatorial telescope were placed at his disposal by friends. The upshot of the expedition was to verify Newton's surmise, that a "most serene and quiet air . . . may perhaps be found on the tops of the highest mountains above the grosser clouds." The scientific results were detailed in a *Report* addressed to the lords commissioners of the admiralty, 1858, in a communication to the Royal Society (*Phil. Trans.* cxlviii. 465) and in the *Edinburgh Observations*, vol. xii. A popular account of the voyage is contained in *Teneriffe, an Astronomer's Experiment*, 1858. In 1871–1872 Piazzi Smyth investigated the spectra of the aurora, and zodiacal light. He recommended the use of the "rainband" for weather prediction (*Jour. Scottish Meteor. Society*, v. 84), and discovered, in conjunction with Professor A. S. Herschel, the harmonic relation between the rays emitted by carbon monoxide. In 1877–1878 he constructed at Lisbon a map of the solar-spectrum (*Edin. Phil. Trans.* xxix. 285), for which he received the Macdougall-Brisbane prize in 1880. Further spectroscopic researches were carried out by him at Madeira in 1880 (*Madeira Spectroscopic*, 1882), and at Winchester in 1884 (*Edin. Phil. Trans.* vol. xxxii. pt. ii.). He published besides *Three Cities in Russia* (1862), *Our Inheritance in the Great Pyramid* (1864), *Life and Work at the Great Pyramid* (1867), and a volume *On the Antiquity of Intellectual Man* (1868). In 1888 he resigned his official position and retired to the neighbourhood of Ripon, where he died on the 21st of February 1900.

See *Month. Notices Roy. Astr. Society*, lxi. 189; *Observatory*, xxiii. 145, 184; R. Copeland in *Astr. Nach.* No. 3636, and *Pop. Astronomy* (1900), p. 384; *Nature*, lxii. 161 (A. S. Herschel); André and Rayet, *L'Astronomie pratique*, ii. 12. (A. M. C.)

SMYTH (or SMITH), **JOHN** (*c.* 1570–1612), English nonconformist divine, commonly called the Se-baptist, was born about 1570, and was educated at Christ's College, Cambridge, where he proceeded M.A. in 1593. He was probably vicar of Hutton Cranswicke in the E. Riding of Yorkshire from 1593 to 1600, when he was elected lecturer or preacher of the city of Lincoln, an office of which he was deprived in October 1602 for having "approved himself a factious man by personal preaching and that truly against divers men of good place." Two volumes of his Lincoln sermons, *The Bright Morning Star* (1603), an exposition of Psalm xxii., and *A Pattern of True Prayer* (1605), were dedicated to Lord Sheffield, who had acted as arbiter between the preacher and the corporation. While preparing these books he became connected with the Separatist movement in Scrooby and Gainsborough, joined the Gainsborough church, and became its pastor.[1] With Thomas Helwys, John Murton (or Morton) and others, he migrated to Amsterdam at the end of 1607 to escape religious persecution, and in that city practised as a physician, and became the leader of "the second English church" (see CONGREGATIONALISM). About this time he wrote his *Principles and Inferences concerning the Visible Church* in support of Robert Browne's theory of ecclesiastical polity, which was followed by *Parallels, Censures and Observations*, a reply to the *Christian Advertisements* of Richard Bernard (1568–1641), vicar of Worksop, a puritan who remained in the Anglican church. In 1608, too, appeared *The Differences of the Churches of the Separation*, in which he justified his non-communion with Johnson's church on the curious ground that it was no part of primitive and apostolic order to use a translation of scripture during worship, or at any rate to have it open before one while preaching (Christ having "closed the book" at Nazareth before His sermon). Under Mennonite influence he went farther, and by March 1609 when he published *The Character of the Beast*, he had become a Baptist (see BAPTISTS, sect. II.), contending against infant baptism because (1) it has neither precept nor example in the New Testament, (2) Christ commanded to make disciples by teaching them and then to baptize them. He and his company were then faced by the dilemma that their own infant baptism did not count, and Smyth solved the problem by first baptizing himself (hence the name Se-Baptist), probably by affusion, and then administering the rite to Helwys and the others. Afterwards with 41 others he decided that instead of baptizing himself he should have been baptized by the Mennonites, in spite of their heretical view of the Person of Christ, and applied for admission to their fellowship. They were somewhat suspicious of a man who had never held one position for long, and demanded a statement of doctrines, which he gave them in twenty articles written in Latin, and in *The Last Book of John Smyth, called the Retractation of his Errors*, together with a confession of faith in 100 Propositions. A friendly Mennonite allowed Smyth's church to meet in his bakery, but Smyth himself died of consumption in August 1612, more than two years before the remaining members of his band, by then reduced to 31, were admitted (January 1615) into the Mennonite communion. Helwys and Morton returned to England, and established the first English Baptist churches.

Smyth was, like the other Cambridge men of his day, especially the Separatists, the bondservant of logic, and wherever he saw "the beckoning hand of a properly constructed syllogism" he was ready to follow. Yet none of those who, in his generation, took the great step had, according to Bishop Creighton, "a finer mind or a more beautiful soul. None of them succeeded in expressing with so much reasonableness and consistency their aspirations after a spiritual system of religious belief and practice. None of them founded their opinions on so large and liberal a basis." In his last declaration he expressed his sorrow for the censures he had passed on Anglicans and Brownists alike, and wrote "All penitent and faithful Christians are brethren in the communion of the outward church, by what name soever they are known; and we salute them all with a holy kiss, being heartily grieved that we should be rent with so many sorts and schisms; and that only for matters of no moment."

See J. H. Shakespeare, *Baptist and Congregational Pioneers* (London, 1906); H. M. Dexter, *The England and Holland of the Pilgrims* (London and Boston, 1906). (A. J. G.)

[1] He was never vicar of Gainsborough, and must not be confused with the John Smyth who was imprisoned in the Marshalsea in 1592.

SMYTH, SIR WARINGTON WILKINSON (1817–1890), British geologist, was born at Naples on the 26th of August 1817, his father, Admiral W. H. Smyth (1788–1865), being at the time engaged in the Admiralty Survey of the Mediterranean. He was educated at Westminster and Bedford schools, and afterwards at Trinity College, Cambridge, where he graduated B.A. in 1839. Having gained a travelling scholarship he spent more than four years in Europe, Asia Minor, Syria and Egypt, paying great attention to mineralogy and mining, examining coalfields, metalliferous mines and salt-works, and making acquaintance with many distinguished geologists and mineralogists. On his return to England in 1844 he was appointed mining geologist on the Geological Survey, and in 1851 lecturer at the School of Mines, a post which he held until 1881 when he relinquished the chair of mineralogy but continued as professor of mining. In later years he became chief mineral inspector to the Office of Woods and Forests, and also to the Duchy of Cornwall. He was elected F.R.S. in 1858. He became president of the Geological Society of London in 1866–1868, and in 1879 he was chairman of a Royal Commission appointed to inquire into accidents in mines, the work in connexion with which continued until 1886. He contributed sundry papers to the *Memoirs of the Geological Survey*, the *Quarterly Journal of the Geological Society* and the *Transactions of the Royal Geological Society of Cornwall*. He was author also of *A Year with the Turks* (1854), and of *A Treatise on Coal and Coal-mining* (1867). He was knighted in 1887. He died in London on the 19th of June 1890, and was buried at St Erth, not far from his country home at Marazion in Cornwall.

A portrait and some reminiscences of W. W. Smyth will be found in the Memoir of Sir A. C. Ramsay (1895), by Sir A. Geikie.

SMYTH (or SMITH), **WILLIAM** (*c.* 1460–1514), bishop of Lincoln, was a Lancashire man by birth, and probably passed some of his early days at Knowsley under the roof of Margaret, countess of Richmond and Derby, the mother of Henry VII. He appears to have been a member of Lincoln College, Oxford, and in 1485, just after the battle of Bosworth, he was made keeper of the hanaper of the chancery. Two of Edward IV's daughters were entrusted to his keeping; he was a member of the royal council and he obtained the livings of Combe Martin, Devon, of Great Grimsby and of Cheshunt, Hertfordshire. In 1491 he was made dean of St Stephen's, Westminster, and two years later bishop of Coventry and Lichfield. The bishop was a member of Prince Arthur's council in the marches of Wales, and in 1501, five years after he had been translated to the bishopric of Lincoln, he became lord president of Wales. About 1507 he and Sir Richard Sutton (d. 1524) set to work to found a new college in Oxford. They rebuilt Brasenose Hall, added other existing halls to it, and having obtained a charter in 1512, called it *The King's haule and college of Brasennose.* Smyth, who was one of the executors of Henry VII.'s will, retired from public life just after this King's death, owing probably to some differences between Bishop Richard Fox and himself; he was, however, president of Wales until his death at Buckden in Huntingdonshire on the 2nd of January 1514. Although an able and scholarly man, Smyth had little sympathy with the new learning. He bestowed rich livings upon his relatives, one of whom, Matthew Smyth, was the first principal of Brasenose College. In addition to his liberal gifts to Brasenose College he gave money or land to Lincoln and to Oriel Colleges; he founded a school at Farnworth, Lancashire, and he refounded the hospital of St John at Lichfield. From 1500 to 1503 he was chancellor of Oxford University.

SNAIL. In England the word "snail" in popular language is associated with Gasteropods which inhabit land or fresh water, and which possess large conspicuous spiral shells; terrestrial Gasteropods, in which the shell is rudimentary and concealed, are distinguished as "slugs." In Scotland the word "slug" is absent from the vernacular vocabulary, both shell-bearing and shell-less inland molluscs being known as snails. Marine Gasteropods are occasionally termed "sea-snails," and the compounds "pond-snails," "river-snails," "water-snails" are in common use. The commonest land-snails are those species which constitute the family *Helicidae*, order *Pulmonata*, sub-order *Stylommatophora*. The families *Limacidae*, *Arionidae* and *Oncidiidae* of the same sub-order, include nearly all the slugs. The *Oncidiidae* are entitled to the name "sea-slugs," as they are shell-less Pulmonates living on the seashore, though not actually in the sea. The term "water-snails" includes the whole of the remaining sub-order of the *Pulmonata*, namely, the *Basommatophora*, in which the eyes are sessile, with the exception of the *Auriculidae*. The latter are terrestrial and occur mostly near the seashore. Thus the whole of the *Pulmonata* (which breathe air, are destitute of gill-plumes and operculum and have a complicated hermaphrodite reproductive system) are either snails or slugs. But there are a considerable number of snails, both terrestrial and aquatic, which are not Pulmonates. The land-snails which have no gill-plume in the mantle-chamber and breathe air, but have the sexes separated, and possess an operculum, belong to the orders *Aspidobranchia* and *Pectinibranchia*, and constitute the families *Helicinidae*, *Proserpinidae*, *Hydrocenidae*, *Cyclophoridae*, *Cyclostomatidae* and *Aciculidae*. The fresh-water snails which are not Pulmonates are the *Paludinidae*, *Valvatidae* and *Ampullaridae*, together with *Neritina*, a genus of the *Neritidae*. These all possess a fully developed gill-plume and are typical Pectinibranchs of the sub-order *Taenioglossa*, most of the members of which are marine.

The family *Helicidae* has a world-wide distribution. In *Helix* the spire forms a more or less obtuse-angled cone; there are above 1200 species, of which 24 are British. *Helix nemoralis*, L., of which *H. hortensis* is a variety, is one of the commonest forms. *Helix pomatia*, L., is the largest species, and is known as the "edible snail"; it is commonly eaten in France and Italy, together with other species. It was formerly believed to have been introduced into Britain by the Romans, but there is no doubt that it is a native. In *Succinea* the cone of the spire is acute-angled; three species are British. In *Vitrina* the spire is very flat and the surface glassy. In *Bulimus* the spire is elongated with a pointed apex. *Pupa* is named from its resemblance to a chrysalis, the apex being rounded. The shell of *Clausilia* is sinistral and its aperture is provided with a hinged plate. The commoner European slugs of small size all belong to the genus *Limax*, in which the opening of the mantle-chamber is posterior. *L. flavus* is the cellar slug. *L. agrestis*, *L. arborum*, *L. maximus* occur in gardens and fields. The larger black slugs are species of *Arion*, of which two are British, *A. ater* and *A. hortensis*. *Testacella haliotidea* is common in Great Britain and throughout Europe.

The species of *Helix* are all herbivorous, like the Pulmonata generally; snails and slugs are well-known enemies to the gardener. The animals being hermaphrodite copulate reciprocally. The eggs of *Helix* are laid separately in the earth, each contained in a calcified shell; those of *Limax* are also separate, but the shell is gelatinous. *Helix* hibernates in a torpid condition for about four months, and during this period the aperture of the shell is closed by a calcareous membrane secreted by the foot.

The *Limnaeidae* occur in all parts of the world. *Limnaeus* contains the largest species. *L. pereger*, Müller, is ubiquitous in Great Britain and common all over Europe. All the species are usually infested with *Cercariae* and *Rediae*, the larval forms of Trematode parasites of vertebrates. *L. truncatulus* harbours the *Cercaria* of *Fasciola hepatica*, the liver-fluke, which causes rot in sheep. *Ancylus*, which occurs in rivers, has a minute limpet-like shell. *Planorbis* has the spire of the shell in one plane. *Physa* is smaller than *Limnaeus* and has the upper part of the spire much shorter. In the *Auriculidae* the aperture is denticulated. *Auricula* is confined to the East Indies and Peru. *Carychium minimum* is British.

Of the *Cyclostomidae* only one species, *Cyclostoma elegans*, Müller, is British; it hides under stones and roots. The *Helicinidae* are exotic, ranging from the West Indies to the Philippines. Of the *Aciculidae*, which are all minute, *Acicula lineata* is British.

The *Ampullaridae* are confined to the tropics. *Ampullaria* has very long tentacles and a long siphon formed by the mantle. *Valvata* is common in fresh waters throughout Britain; the gill when the animal is expanded is protruded beyond the mantle-chamber. The *Paludinidae* are common in the N. hemisphere. *Paludina* and *Bithynia* are both British genera. In *Paludina* the whorls of the spiral are very prominent; the genus is viviparous. *Bithynia* is smaller and the shell smoother.

Neritina has a very small spire, the terminal portion of the shell containing nearly the whole animal.

For the morphology and classification of snails, see GASTROPODA. A history of the British forms is given in Gwyn Jeffreys's *British Conchology* (1862), and by Forbes and Hanley in *British Mollusca*. For speciegraphical details, see Woodward's *Manual of the Mollusca* (1875), and Bronn's *Tierreich* (Weichtiere). For *Fasciola hepatica*, see Thomas, *Quart. Journ. Mic. Sci.* (1882).

SNAKE-BIRD (the "darter" of many authors, and the *Plotus anhinga*[1] of ornithology), the type of a small but very well-marked genus of birds, *Plotus*, belonging to the family *Phalacrocoracidae* which contains the cormorants and shags. The name commonly given to it by the English in N. America was derived from its "long slender head and neck," which, its body being submerged as it swims, "appears like a snake rising erect out of the water" (J. Bartram's MS., quoted by G. F. Ord in A. Wilson's *Am. Ornithology*, ix. 81). Snake-birds bear a general resemblance both outwardly and in habits to Cormorants (*q.v.*), but are much more slender in form and have both neck and tail much elongated. The bill also, instead of being tipped with a maxillary hook, has its edges beset with serratures directed backwards, and is sharply pointed—in this respect, as well as in the attenuated neck, likening the Snake-birds to the Herons; but the latter do not generally transfix their prey as do the former.

The male of the American species, which ranges from Illinois to the S. of Brazil, is in full breeding-plumage a very beautiful bird, with crimson irides, the bare skin round the eyes apple-green and that of the chin orange, the head, neck and most part of the body

Indian Snake-Bird (from S. R. Tickell's Drawing in the Library of the Zoological Society).

clothed in black glossed with green; but down each side of the neck runs a row of long hair-like white feathers, tinged with pale lilac. The much elongated scapulars, and the small upper wing-coverts bear each a median white mark, which on the former is a stripe pointed at either end, and on the latter a broad ovate patch.[2] The larger wing-coverts are dull white, but the quill-feathers of the wings and tail are black, the last broadly tipped with brownish-red, passing into greyish-white, and forming a conspicuous band when the tail is spread in form of a fan, as it often is under water.[3] The hen differs much in appearance from the cock, having the head, neck and breast of a more or less deep buff, bounded beneath by a narrow chestnut band; but otherwise her plumage is like that of her mate, only not so bright in colour. The Snake-bird frequents the larger rivers or back-waters connected with them, where it may be seen resting motionless on some neighbouring tree, generally choosing a dead branch, or on a "snag" projecting from the bottom, whence it plunges beneath the surface, in pursuit of its prey, to emerge, in the manner before related, showing little more than its slender head and neck. Its speed and skill under water are almost beyond exaggeration, and it exhibits these qualities even in captivity, taking—apparently without effort—fish after fish, however rapidly they may swim and twist, and only returning to its perch when its appetite is appeased or its supply of food exhausted. At liberty it will indulge in long flights, and those of the male at the breeding-

[1] "Anhinga," according to Marcgrav, who first described this bird (*Hist. rer. nat. Brasiliae*, p. 218), was the name it bore among the natives.

[2] These feathers are very characteristic of each species of the genus, and in India, says Jerdon, are among the Khasias a badge of royalty.

[3] This peculiarity, first pointed out to the writer by A. D. Bartlett, who observed it in birds in the Zoological Society's possession, doubtless suggested the name of "Water-Turkey" by which in some places *Plotus anhinga* is said to be known.

season are ostentatiously performed in the presence of his mate, around whom he plays in irregular zigzag courses. The nest is almost always in trees or bushes overhanging the water's edge, and is a large structure of sticks, roots and moss, in which are laid four eggs with the white chalky shell that is so characteristic of most Steganopodous birds. Not infrequently several or even many nests are built close together, and the locality that suits the Snake-bird suits also many of the herons.[1] The African snake-bird, *P. congensis* (or *levaillanti* of some authors), inhabits the greater part of that continent N. from Natal; but, though met with on the White Nile, it is not known to have occurred in Egypt, a fact the more remarkable seeing that Canon Tristram found it breeding in considerable numbers on the Lake of Antioch, to which it is a summer visitor, and it can hardly reach its home without passing over the intervening country. The male bird is easily distinguishable from the American species by its rufous coronal patch, its buff throat and its chestnut greater wing-coverts. A third species, *P. melanogaster*, ranges from Madagascar to India, Ceylon, Borneo, Java and China. This so closely resembles the last-mentioned that the differences between them cannot be briefly expressed. The Australian region also has its snake-bird, which is by some regarded as forming a fourth species, *P. novae-hollandiae*; but others unite it to that last mentioned, which is perhaps somewhat variable, and it would seem (*P.Z.S.*, 1877, p. 349) that examples from New Guinea differ somewhat from those inhabiting Australia itself.

The anatomy of the genus *Plotus* has been dealt with more fully than that of most forms. Beside the excellent description of the American bird's alimentary canal furnished to Audubon by Macgillivray, other important points in its structure have been well set forth by A. H. Garrod and W. A. Forbes in the Zoological *Proceedings* (1876, pp. 335-345, pls. xxvi.-xxviii.: 1878, pp. 679-681; and 1882, pp. 208-212), showing among other things that there is an appreciable anatomical difference between the species of the New World and of the Old; while the osteology of *P. melanogaster* has been admirably described and illustrated by A. Milne-Edwards in A. Grandidier's great *Oiseaux de Madagascar* (pp. 691-695, pls. 284, 285). In all the species the neck affords a feature which seems to be unique. The first seven of the cervical vertebrae form a continuous curve with its concavity forward, but the eighth articulates with the seventh nearly at a right angle, and, when the bird is at rest, lies horizontally. The ninth is directed downwards almost as abruptly, and those which succeed present a gentle forward convexity. The muscles moving this curious framework are as curiously specialized, and the result of the whole piece of mechanism is to enable the bird to spear with facility its fishy prey. (A. N.)

SNAKE-FLY, the name given to neuropterous insects of the genus *Raphidia*, closely allied to the alder-flies, remarkable for the elongation of the head and prothorax to form a neck and for the presence in the female of a long ovipositor. The larva, which is active and carnivorous, is terrestrial, and lives in rotten timber.

SNAKE-ROOT. In most countries where snakes abound some root or herb is used by the natives as an antidote for the bites of venomous species, and many herbs have consequently received the name of snake-root. Botanically speaking, the name properly belongs to *Ophiorrhiza Mungos*, the Mungoose plant, a plant of the natural order Rubiaceae, used in the E. Indies for the purpose above indicated. In medicine, however, the roots of *Aristolochia Serpentaria*, *Polygala Senega* and *Cimicifuga racemosa* were understood by this name, being distinguished as the Virginian, seneca and black snake-roots. The root of *Aristolochia reticulata* is known in the United States as Red river or Texan snake-root.

The roots or rhizome of *Liatris spicata*, *Eryngium aquaticum* and *Eupatorium altissimum* have all been used in N. America for snake-bites, the first two being known as button snake-root and the last as white snake-root. The rhizome of *Asarum canadense* passes under the name of Canadian snake-root. All of these contain acrid or aromatic principles which, when a warm decoction of the drug is taken, exercise a powerfully diaphoretic or, in some cases, diuretic action, to which any benefit that may be derived from their use must be attributed.

SNAKES, an order (*Ophidia*) in the class of Reptiles. They may be characterized as very elongated reptiles without limbs (unless with tiny vestiges of posterior limbs), without eyelids and external ear openings, with the teeth anchylosed to the supporting bones, a bifid slender tongue which is telescoped into its basal half, and with a transverse vent. These characters apply to all snakes, although none are peculiar to them. The vast majority of snakes are further characterized by having the right and left halves of the under-jaws connected by an elastic band; a median, longitudinal furrow in the skin below and behind the chin; the whole palatal apparatus is but loosely connected with the skull, nowhere articulating with it. The quadrate is indirectly articulated with the skull, first by the horizontal, movable squamosal, secondly by the columella auris. The quadrato-mandibular joint is placed in a level far behind the occiput.

More detail concerning skull, scales and teeth will be found in the diagnostic descriptions of the various families (*vide infra*): for further anatomical information the reader is referred to the article REPTILES (*Anatomy*).

The snakes are the most highly specialized branch of the *Sauria* or *Squamata*, *i.e.* of scaly reptiles with movable quadrate bones; with a transverse vent, near the posterior lateral corners of which open the eversible, paired copulatory organs. In the article LIZARD attention is drawn to the many characters which make it difficult, if not impossible, to give diagnoses applicable to all lizards and all snakes. Both these groups seem to have reached their climax but recently, while the tortoises, crocodiles and sphenodon are on the descending scale, mere remnants of formerly much more numerous and cosmopolitan development.

The number of recent species of snakes is about 1600. The order is practically cosmopolitan, with the exception of New Zealand and certain absolutely isolated oceanic islands, like the Hawaiian islands and the Azores. The N. limit approaches that of the permanently frozen subsoil, going into the arctic circle in Scandinavia, elsewhere sinking to about 54° N.; in the S. hemisphere the 45th parallel may indicate their limit. The number of species and individuals steadily decreases in the cooler temperate zones, whilst it reaches its maximum in the tropics. Every kind of terrain is tenanted, from dense, moist and hot forests at the level of the sea to arid deserts, high plateaus and mountains. In accordance with this general distribution snakes show a great amount of differentiation with regard to their mode of life and general organization; and from the appearance alone of a snake a safe conclusion can be drawn as to its habits.

Dr A. Günther characterizes the chief categories as follows:—(1) Burrowing snakes, which live under ground and but rarely appear on the surface. They have a cylindrical rigid body, covered with generally smooth and polished scales; a short strong tail; a short rounded or pointed head with narrow mouth; teeth few in number; small or rudimentary eyes; no abdominal scutes or only narrow ones. They feed chiefly on invertebrate animals, and none are poisonous. (2) Ground snakes rarely ascending bushes or entering water. Their body is cylindrical, flexible in every part, covered with smooth or keeled scales, and provided with broad ventral and subcaudal scutes. The non-poisonous kinds of ground snakes are the typical and least specialized snakes, and more numerous than any of the other kinds. They feed chiefly on terrestrial vertebrates. The majority are non-poisonous; but the majority of poisonous snakes must be referred to this category. (3) Tree snakes, which are able to climb bushes or trees with facility or pass even the greater part of their existence on trees. Their body is generally compressed and slender; their broad ventral scutes are often carinate on the sides. Those kinds which have a less elongate and cylindrical body possess a distinctly prehensile tail. The eye is generally large. Their coloration consists often of bright hues, and sometimes resembles that of their surroundings. They feed on animals which likewise lead an arboreal life, rarely on eggs. Poisonous as well as innocuous snakes are represented in this category. (4) Freshwater snakes, living in or frequenting fresh waters; they are excellent swimmers and divers. The nostrils are placed on the top of the snout and can be closed whilst the animal is under water. Their body is covered with small scales and the ventral scutes are mostly narrow; the tail tapering; head flat, rather short; and the eyes of small size. They feed on fish, frogs and other aquatic animals, and are innocuous and viviparous. (5) Sea snakes are

[1] The curious but apparently well-attested fact of the occurrence in England, near Poole, in June 1851, of a male bird of this species (*Zoologist*, pp. 3601, 3654) has been overlooked by several writers who profess to mention all cases of a similar character.

distinguished by the compressed, rudder-shaped tail. They are unable to move on land, feed on fishes, are viviparous and poisonous.

The majority of snakes are active during the day, their energy increasing with the increasing temperature; whilst some delight in the moist sweltering heat of dense tropical vegetation, others expose themselves to the fiercest rays of the midday sun. Not a few, however, lead a nocturnal life, and many of them have, accordingly, their pupil contracted into a vertical or more rarely a horizontal slit. Those which inhabit temperate latitudes hibernate. Snakes are the most stationary of all vertebrates; as long as a locality affords them food and shelter they have no inducement to change it. Their dispersal, therefore, must have been extremely slow and gradual. Although able to move

FIG. 1.—Diagram of Natural Locomotion of a Snake.

with rapidity, they do not keep in motion for any length of time. Their organs of locomotion are the ribs, the number of which is very great, nearly corresponding to that of the vertebrae of the trunk. They can adapt their motions to every variation of the ground over which they move, yet all varieties of snake locomotion are founded on the following simple process. When a part of the body has found some projection of the ground which affords it a point of support, the ribs are drawn more closely together, on alternate sides, thereby producing alternate bends of the body. The hinder portion of the body being drawn after, some part of it (*c*) finds another support on the rough ground or a projection; and, the anterior bends being stretched in a straight line, the front part of the body is propelled (from *a* to *d*) in consequence. During this peculiar locomotion the numerous broad shields of the belly are of great advantage, as by means of their free edges the snake is enabled to catch and use as points of support the slightest projections of the ground. A pair of ribs corresponds to each of these ventral shields. Snakes are not able to move over a perfectly smooth surface. The conventional representation of the progress of a snake, in which its undulating body is figured as resting by a series of lower bends on the ground whilst the alternate bends are

FIG. 2.—Diagram of Conventional Idea of a Snake's Locomotion.

raised above it, is an impossible attitude, nor do snakes ever climb trees in spiral fashion, the classical artistic mode of representation. Also the notion that snakes when attacking are able to jump off the ground is quite erroneous; when they strike an object, they dart the fore part of their body, which was retracted in several bends, forwards in a straight line. And sometimes very active snakes, like the cobra, advance simultaneously with the remainder of the body, which, however, glides in the ordinary fashion over the ground; but no snake is able to impart such an impetus to the whole of its body as to lose its contact with the ground. Some snakes can raise the anterior part of their body and even move in this attitude, but it is only about the anterior fourth or third of the total length which can be thus erected.

With very few exceptions, the integuments form imbricate scale-like folds arranged with the greatest regularity; they are small and pluriserial on the upper parts of the body and tail, large and uniserial on the abdomen, and generally biserial on the lower side of the tail. The folds can be stretched out, so that the skin is capable of a great degree of distension. The scales are sometimes rounded behind, but generally rhombic in shape and more or less elongate; they may be quite smooth or provided with a longitudinal ridge or *keel* in the middle line. The integuments of the head are divided into non-imbricate shields or plates, symmetrically arranged, but not corresponding in size or shape with the underlying cranial bones or having any relation to them. The form and number of the scales and scutes, and the shape and arrangement of the head-shields, are of great value in distinguishing the genera and species, and it will therefore be useful to explain in the accompanying woodcut (fig. 3) the terms by which these parts are designated. The skin does not form eyelids; but the epidermis passes over the eye, forming a transparent disk, concave like the glass of a watch, behind which the eye moves. It is the first part which is cast off when the snake sheds its skin; this is done several times in the year, and the epidermis comes off in a single piece, being, from the mouth towards the tail, turned inside out during the process.

The tongue in snakes is narrow, almost worm-like, generally of a black colour and forked, that is, it terminates in front in two extremely fine filaments. It is often exserted with a rapid motion, sometimes with the object of feeling some object, sometimes under the influence of anger or fear.

Dentition.

Snakes possess teeth in the maxillaries, mandibles, palatine and pterygoid bones, sometimes also in the intermaxillary; they may be absent in one or the other of the bones mentioned. In the innocuous snakes the teeth are simple and uniform in structure, thin, sharp like needles, and bent backwards; their function consists merely in seizing and holding the prey. In some all the teeth are nearly of the same size; others possess in front of the jaws (Lycodonts) or behind in the maxillaries (Diacrasterians) a tooth more or less conspicuously larger than the rest; whilst others again are distinguished by this larger posterior tooth being grooved along its outer face. The snakes with this grooved kind of tooth have been named *Opisthoglyphi*, and also *Suspecti*, because their saliva is more or less poisonous. In the true poisonous snakes the maxillary dentition has undergone a special modification. The so-called colubrine venomous snakes, which retain in a great measure an external resemblance to the innocuous snakes, have the maxillary bone not at all, or but little, shortened, armed in front with a fixed, erect fang, which is provided with a deep groove or canal for the conveyance of the poison, the fluid being secreted by a special poison-gland. One or more small ordinary teeth may be placed at some distance behind this poison-fang. In the other venomous snakes (viperines and crotalines) the maxillary bone is very short, and is armed with a single very long curved fang with a canal and aperture at each end. Although firmly anchylosed to the bone, the tooth, which when at rest is laid backwards, is erectile,—the bone itself being mobile and rotated round its transverse axis. One or more reserve teeth, in various stages of development, lie between the folds of the gum and are ready to take the place of the one in function whenever it is lost by accident, or shed.

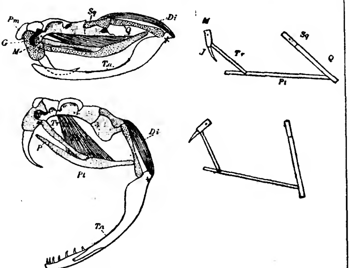
The poison is secreted in modified upper labial glands, or in a pair of large glands which are the homologues of the parotid salivary glands of other animals. For a detailed account see West, *J. Linn. Soc.* xxv. (1895), p. 419; xxvi. (1898), p. 517; and xxviii. (1900). A duct leads to the furrow or canal of the tooth. The Elapinae have comparatively short fangs, while those of the vipers, especially the crotaline snakes, are much longer, sometimes nearly an inch in length. The Viperidae alone have "erectile" fangs. The mechanism is explained by the diagrams (fig. 4). The poison-bag lies on the side of the head between the eye and the mandibular joint and is held in position by strong ligaments which are attached to this joint and to the maxilla so that the act of opening the jaws and concomitant erection of the fangs automatically squeezes the poison out of the glands.

Snakes are carnivorous, and as a rule take living prey only; a few feed habitually or occasionally on eggs. Many swallow their victim alive; others first kill it by smothering it between the coils of their body (constriction). The effects of a bite by a poisonous snake upon a small mammal or bird are almost instantaneous, preventing its escape; and the snake swallows its victim at its leisure, sometimes hours after it has been killed. The prey is always swallowed entire, and, as its girth generally much exceeds that of the snake, the progress of deglutition is very laborious and slow. Opening their jaws to their fullest extent, they seize the animal generally by the head, and pushing alternately the right and left sides of the jaws forward, they press the body through their elastic gullet into the stomach, its outlines being visible for some time through the distended walls of the abdomen. Digestion is quick and much accelerated by the quantity of saliva which is secreted during the progress of deglutition, and in venomous snakes probably also by the chemical action of the poison. The primary function of the poison-apparatus is to serve as the means of procuring their food, but



From *Cambridge Natural History*, vol. viii., "Amphibia and Reptiles," by permission of Macmillan & Co., Ltd.

FIG. 4.—Poison Apparatus of Rattlesnake. Upper figures: diagrams of skull with fangs at rest. Lower figures: same, with fangs protruded. *G*, prefrontal; *M*, maxilla; *J*, poison-fang; *Tr*, transpalatine; *Pt*, pterygoid; *p*, palatine; *Q*, quadrate; *Sq*, squamosal; *Pm*, premaxilla; *T.a*, articular; *Pe* and *Di*, muscles.

it also serves for defence. Only very few poisonous snakes (like *Naja elaps*) are known to resent the approach of man so much as to follow him on his retreat and to attack him. Others are much less inclined to avoid collision with man than innocuous kinds. They have thus become one of the greatest scourges to mankind, and Sir J. Fayrer has demonstrated that in India alone annually some 20,000 human beings perish from snake-bites. Therefore it will not be out of place to add here a chapter on snake poison and on the best means (ineffectual though they be in numerous cases) of counteracting its deleterious effects. An excellent account of the nature and of the effect of the venom of snakes, by Charles J. Martin, is in Allbutt's *System of Medicine*. The following condensed account has been abstracted from it.

Snake poison. The poison is a clear, pale-yellow fluid which reacts acid, and contains about 30% of solids, but this varies according to the state of concentration. Most venoms are tasteless, but cobra poison is said to be disagreeably bitter. Dried venom keeps indefinitely, and dissolves readily in water. It keeps also in glycerine. It contains albuminous bodies in solution, and is in fact a pure solution of two or more poisonous proteids, which are the active agents, with a small quantity of an organic acid or colouring matter. The venom is destroyed by reagents which precipitate proteids in an insoluble form, or which destroy them, *e.g.* silver nitrate or permanganate of potash. Hypochlorites have the same effect. But carbolic acid and caustic potash destroy it only after a day or two, consequently they are not a remedy.

The venom is generally introduced into the subcutaneous tissue, whence it reaches the general circulation by absorption through the lymph and blood-vessels. When introduced directly into a vein, the effects are instantaneous. It is absorbed by the conjunctiva, but, excepting cobra poison, not by the mouth or alimentary canal, provided there be no hollow teeth and no abrasions. The venom of the various kinds of snakes acts differently.

The Symptoms of Cobra Poison.—Burning pain, followed by sleepiness and weakness in the legs after half an hour. Then profuse salivation, paralysis of the tongue and larynx, and inability to speak. Vomiting, incapacity of movement. The patient seems to be conscious. Breathing becoming difficult. The heart's action is quickened. The pupil remains contracted and reacts to light. At length breathing ceases, with or without convulsions, and the heart slowly stops. Should the patient survive, he returns rapidly to complete health.

Rattlesnake Poison.—The painful wound is speedily discoloured and swollen. Constitutional symptoms appear as a rule in less than fifteen minutes: prostration, staggering, cold sweats, vomiting, feeble and quick pulse, dilatation of the pupil, and slight mental disturbance. In this state the patient may die in about twelve hours. If he recovers from the depression, the local symptoms begin to play a much more important part than in cobra-poisoning: great swelling and discoloration extending up the limb and trunk, rise of temperature and repeated syncope, and laboured respiration. Death may occur in this stage. The local haemorrhagic extravasation frequently suppurates, or becomes gangrenous, and from this the patient may die even weeks afterwards. Recovery is sudden, and within a few hours the patient becomes bright and intelligent.

Symptoms of Bite from the European Viper.—Local burning pain; the bitten limb soon swells and is discoloured. Great prostration, vomiting and cold, clammy perspiration follow within one to three hours. Pulse very feeble, with slight difficulty in breathing, and restlessness. In severe cases the pulse may become imperceptible, the extremities may become cold, and the patient may pass into coma. In from twelve to twenty-four hours these severe constitutional symptoms usually pass off, but in the meantime the swelling and discoloration have spread enormously. Within a few days recovery usually occurs somewhat suddenly, but death may occur from the severe depression, or from the secondary effects of suppuration.

The symptoms of the bite from the *Daboia* or *Vipera russeli* resemble the effects of rattlesnake poison, but sanious discharges from the rectum, &c., are an additional and prominent feature. The recovering patient suffers from haemorrhagic extravasations in various organs, besides from the lungs, nose, mouth and bowels. Kidney haemorrhage and albuminuria is a constant symptom. The pupil is always dilated and insensitive to light.

Bite of Australian Elapine Snakes.—Pain and local swelling. The first constitutional symptoms appear in fifteen minutes to two hours. First faintness and irresistible desire to sleep. Then alarming prostration and vomiting. Pulse extremely feeble and thread-like, and uncountable. The limbs are cold and the skin is blanched. Respiration becomes shallow with the increasing coma. Sensation is blunted. The pupil is widely dilated and insensible to light. There is sometimes passing of blood. If the patient survives the coma, recovery is complete and as a rule rapid, without secondary symptoms.

The Australian venom and that of all viperine snakes, perhaps also that of the cobra, if introduced rapidly into the circulation, occasions extensive intravascular clotting. If the venom is slowly absorbed, the blood loses its coagulability, owing to the breaking down of the red blood-corpuscles, most so with vipers, less with Australian snakes, least so with the cobra. The cobra venom is supposed to extinguish the functions of the various nerve-centres of the cerebro-spinal system, the paralysation extending from below upwards, and it has a special affinity for the respiratory centre. The toxicity or relative strength of the cobra venom has been calculated to be sixteen times that of the European viper. Snakes can poison each other, even those of the same kind.

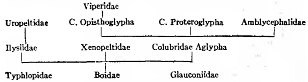
Treatment.—Apply a ligature above, not on the top of, the situation of the bite, twist the string tightly with a stick. Then make a free incision into the wound. Sucking out is dangerous! Then bandage the limb downwards, progressing towards the wound; repeat this several times. Do not keep the ligature longer than half an hour. Then let the circulation return, and apply the ligature again. In any case do not keep the ligature on for more than an hour for fear of gangrene. Direct application into the widened wound of calcium hypochlorite, *i.e.* bleaching powder, is very good, or of a 1% solution of permanganate of potash, or Condy's fluid. Vigorous cauterization with nitrate of silver, driving the stick into the widened wound, is also good, and it is a remedy which one can carry in the pocket. Quick amputation of the finger is the best remedy of all if a large snake has bitten it.

Internal Remedies.—The administration of enormous doses of alcohol is to be condemned strongly. Small, stimulating doses, and repeated, are good, but stimulation can be more effectively produced by ammonia or strychnine. Hypodermic injection of strychnine, in some cases as much as one to two grains (but not into a vein!), has in some cases had good results; but injection of ammonia, instead of doing any good, has disastrous sloughing results. There is only one fairly reliable treatment, that by serum therapeutics, the injection of considerable quantities of serum of animals which have been partially immunized by repeated doses of [that particular] snake-venom. Unfortunately this treatment will not often be available. Several mammals and birds are supposed to be immune by nature against snake-venom. Some more or less immune creatures are the mongoose, the hedgehog and the pig, the secretary-bird, the honey buzzard, the stork and probably other snake-eaters.

Snakes are oviparous; they deposit from ten to eighty eggs of an ellipsoid shape, covered with a soft leathery shell, in places where they are exposed to and hatched by moist heat. The parents pay no further attention to them, except the pythons, which incubate their eggs by coiling their body over them, and fiercely defend them. In some families, as many freshwater snakes, the sea snakes, Viperinae and Crotalinae, the eggs are retained in the oviduct until the embryo is fully developed. These snakes bring forth living young.

Classification. The classification of snakes has undergone many vicissitudes. J. Müller (*Zeitschr. f. Physiol.*, 1831, p. 265) divided them into *Ophidia macrostomata* and *O. microstomata*. A. M. C. Duméril (*Catal. méthodique, Mus. d'Hist. Nat.*, Paris, 1851, p. 199) distinguished between Opoterodonta, Aglyphodonta, Proteroglypha and Solenoglypha. H. Stannius (*Zootomie d. Amphib.*, 1856) made a further improvement by combination of the principles used by his predecessors, and he divided the Angiostomata or narrow-mouthed snakes into Tortricina, Typhlopina and Uropeltacea; the Eurystomata into Iobola or poisonous, and *Asinea* or innocuous snakes. Meanwhile J. E. Gray (*Cat. Snakes*, Brit. Mus., 1849) had distinguished only between Viperina and Colubrinia. A. Günther (*Cat. Colubrine Snakes*, Brit. Mus., 1858; "Reptiles of British India," Ray Soc., 1864; article SNAKES, *Ency. Brit.*, 9th ed.) recognized at last four sub-orders:—Hopoterodontes, Colubriformes, Colubriformes venenosi, Viperiformes; the most serious drawback being the merging of the Peropoda in the non-poisonous Colubriformes. E. D. Cope (*Proc. Ac. Philad.*, 1864, p. 230) resorted to the modifications of the squamosal, ecto- and endopterygoid bones, the condition of the vestigial limbs, and the teeth:—Scolecophidia (Typhlopidae), Catodonta (Glauconiidae), Tortricina (Ilysiidae and Uropeltidae), Asinea, Proteroglypha and Solenoglypha. He adhered to this arrangement in his last comprehensive work (*Crocodilians, Lizards and Snakes of North America*, 1898, Smithsonian Inst., 1900), but combined the Asinea and Proteroglypha as Colubroidea, subdividing these into Peropoda, Aglyphodonta, Glyphodonta, Proteroglypha and Platycerca (Hydrophinae). In his last work he used, with doubtful success, the variations of the penes and the lungs as additional characters, chiefly for the grouping of the great mass of the Colubroid snakes. G. A. Boulenger (*Cat. Snakes*, Brit. Mus., 1893–1896) accepted Cope's principles, and mainly by combining the Asinea of Stannius and Cope with the Proteroglypha as Colubridae—wherein he was followed by Cope, as mentioned above—and separating therefrom the Peropoda or Boidae, he has produced a logically-conceived system, by far the best hitherto proposed. It is followed in the present article.

Boulenger's phylogenetic system stands as follows:—



This means that the Boidae retain most primitive characters. Likewise primitive, but in various respects degraded, mainly owing to burrowing habits, are the Typhlopidae with the Ilysiidae, and Uropeltidae as a terminal branch, and on the other hand the Glauconiidae. The solitary Xenopeltis is in several ways intermediate between Boidae and Ilysiidae. The rest of the snakes are supposed to have started from some primitive, non-degenerate, therefore boa-like group, leading by loss of the vestiges of the hind-limbs and loss of the coronoid bone of the mandible to the aglyphous or innocuous Colubridae, whence further differentiation in three new lines has taken place,—(1) the harmless Amblycephalidae as a side-issue, (2) the very poisonous proteroglyphous Elapidae, (3) the moderately or incipiently poisonous Opisthoglypha, out of some of which seem to have arisen the venomous Viperidae.

I. No ectopterygoid; pterygoid not extending to quadrate; no supratemporal or squamosal; prefrontal forming a suture with nasal; coronoid present; vestiges of pelvis present.

Maxillary vertical, loosely attached, toothed; mandible toothless; a single pair of pelvis bones: *Typhlopidae.*

Maxillary bordering the mouth, forming sutures with the premaxillary, prefrontal and frontal, toothless; lower jaw toothed; pubis and ischium present, the latter forming a symphysis: *Glauconiidae.*

II. Ectopterygoid present; upper and lower jaws toothed.

A. Coronoid present, prefrontal in contact with nasal.

1. Vestiges of hind-limbs; supratemporal present.
   - Squamosal large, suspending the quadrate: *Boidae.*
   - Squamosal small, intercalated in the cranial wall: *Ilysiidae.*
2. No vestiges of limbs. squamosal absent: *Uropeltidae.*

B. Coronoid absent; squamosal present.

1. Maxillary horizontal; pterygoid reaching quadrate or mandible.
   - Prefrontal in contact with nasal: *Xenopeltidae.*
   - Prefrontal not in contact with nasal: *Colubridae.*
2. Maxillary horizontal; pterygoid not reaching quadrate or mandible: *Amblycephalidae.*
3. Maxillary vertically erectile, perpendicularly to ectopterygoid, and reaching quadrate or mandible: *Viperidae.*

For ordinary practical purposes this synopsis is useless, most of the anatomical characters being visible only in the macerated skull. The following characterization of the families is based upon more accessible features.

Eyes vestigial or hidden; lower jaw toothless; without enlarged ventral scales: *Typhlopidae.*

Eyes vestigial; teeth restricted to the lower jaw; without enlarged ventral scales: *Glauconiidae.*

Eyes very small; head not distinct; teeth in the upper and lower jaws; ventral scales scarcely enlarged; tail extremely short, ending obtusely and covered with peculiar scales: *Uropeltidae.*

Eyes functional, free, with vestiges of the hind-limbs appearing as claw-like spurs on each side of the vent.

- Ventral scales scarcely enlarged: *Ilysiidae.*
- Ventral scales transversely enlarged: *Boidae.*

Eyes free; with a pair of poison-fangs in the front part of the mouth, carried by the otherwise toothless, much shortened, and vertically erectile maxillaries; ventral scales transversely enlarged: *Viperidae.*

All the remaining snakes combine the following characters. the maxillaries are typically horizontal, not separately movable, with a series of teeth. The mandible is toothed but has no coronoid bone. There are no vestiges of limbs or of their girdles. The eyes are free.

- Dentary movably attached to the tip of the articular bone of the mandible. Skin beautifully iridescent: *Xenopeltidae.*
- Without a mental groove; the ends of the pterygoids are free, not reaching the quadrate. Head thick and very distinct: *Amblycephalidae.*
- With a median longitudinal groove between the shields of the skin: *Colubridae.*

Family 1. TYPHLOPIDAE.—Burrowing snakes, mostly small, which have the body covered with smooth, shiny, uniform cycloid scales. The teeth are restricted to the small maxillary bones. The quadrates slant obliquely forward and are attached directly to the prootics, owing to the absence of squamosals. The prefrontals are in lateral contact with the nasals. The vestiges of the pelvis are reduced to a single bone on each side, and there are no traces of limbs. The eyes are hidden by shields of the skin. The mouth is very narrow, and the halves of the under-jaw are not distensible. About 100 species of these rather archaic snakes are known; in adaptation to their burrowing life and worm and insect diet, they have undergone degradation. The tail is mostly very short and sometimes ends in a horny spine. They are widely distributed in all tropical and subtropical countries, even in such solitary places as Christmas Island, but they do not occur in New Zealand. The chief genus is *Typhlops*,

FIG. 5.—*Typhlops bothriorhynchus*, from India, natural size.

of which, for instance, *T. braminus* ranges from southern Asia, the islands of the Indian Ocean and the Malay Islands to southern Africa.

Family 2. GLAUCONIIDAE.—Burrowing like the Typhlopidae, which they much resemble externally, but the maxillaries retain their normal position and are toothless, teeth being restricted to the lower jaw, which is short, stout, and not distensible. The pelvic girdle and the hind-limbs show the least reduction found in any recent snakes, ilia, pubes and ischia being still distinguishable, the last even retaining their symphysis, and there are small vestiges of the femurs. About 30 species, mostly of the genus *Glauconia*, in south-western Asia, Africa, Madagascar, the Antilles and both Americas, *G. dulcis* ranging northwards into Texas, *G. humilis* into California.

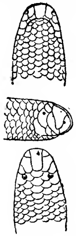


FIG. 6.—Three Views of Head of *Typhlops braminus* (India), magnified.

Family 3. ILYSIIDAE.—Mostly burrowing. The scales of the long, cylindrical body are smooth and small, scarcely enlarged on the ventral side. The tail is extremely short and blunt. The head is very small and not distinct from the neck, a usual feature in burrowing snakes and lizards. The gape of the mouth is narrow. The quadrate bones are short and stand rather vertically. The squamosals form part of the cranial wall, being firmly wedged in between the quadrate, proötic and occipital bones. Vestiges of the pelvis and hind-limbs are small, but they terminate in claw-like spurs which protrude between the scales on either side of the vent. as in the Boidae. The small eyes are sometimes covered by transparent shields. About half-a-dozen species only are known in South America, Ceylon, the Malay Islands and Indo-China. They are viviparous like the Typhlopidae, upon which they feed besides worms and insects. *Ilysia* s. *Tortrix scytale*, one of the "coral-snakes" of tropical South America, is beautiful coral-red with black rings, grows to nearly a yard in length, and is said sometimes to be worn as a necklace by native ladies.

Family 4. UROPELTIDAE (RHINOPHIDAE).—Burrowing snakes of Ceylon and southern India, with a very short tail, which ends in a peculiar, often obliquely truncated, shield, hence the name. The eyes are very small. The scales of the body are smooth and are but little larger on the belly. The coloration is mostly beautiful, black and red. The Uropeltidae are in various respects intermediate between the two last and the next family. The quadrates are directly attached to the skull, the squamosals being absent. Teeth are carried in both jaws. There are no vestiges of hind-limbs or of the pelvis.

These tail-shielded snakes, of which about 40 species are known, are viviparous and burrow in the ground, preferring damp mountain-forests. *Uropeltis grandis*, the only species of the type-genus, is confined to Ceylon; about 18 in. in length, it is blackish above, yellow below, often with small spots on the upper and the under surface. *Rhinophis sanguineus* lives in southern India; it is black above with a bluish gloss, the belly is bright red with black spots, like the convex tail-shield.

Family 5. BOIDAE.—Typical, often very large, snakes, which have vestiges of pelvis and hind-limbs, the latter appearing as claw-like spurs on each side of the vent. The scales of the upper surface are usually small and smooth, while those of the belly form one broad series. The quadrate is carried by the horizontally-elongated squamosal, which rests loosely upon the skull. The prefrontals are in contact with the nasals. Sharp, recurved teeth are carried by the mandibles, the pterygoids, palatines, maxillaries, and in the Pythoninae by the premaxillaries also. The Boidae comprise some 60 species, which have been grouped into many fancy genera. The range of the family extends over all the tropical and subtropical countries, including islands, except New Zealand.

Sub-family 1. *Pythoninae.*—With a pair of supraorbital bones between the prefrontal, frontal and postfrontal bones. The premaxilla generally carries a few small teeth. The subcaudal scales are mostly in two rows. The pythons (*q.v.*) are restricted to the palaeotropical and Australian regions, with the sole exception of *Loxocemus bicolor* in southern Mexico.

Sub-family 2. *Boinae.*—Without supraorbital bones. The premaxilla is toothless. The subcaudal scales form mostly a single row. Widely distributed. *Boa* (*q.v.*) in tropical America and with two species in Madagascar. *Eunectes murinus*, the Anaconda (*q.v.*), *Charina*, *e.g. bottae*, a small sand-snake from Oregon to California. *Eryx jaculus*, also a sand-snake, from North Africa to Central Asia, and extending into Greece. *Enygrus*, ranging from New Guinea to the Fiji Islands. *Casarca dussumieri*, differing from *Boa* chiefly by the rough and strongly-keeled scales, is confined to Round Island near Mauritius. This makes the occurrence of a species of *Corallus* in Madagascar less remarkable, while all the others live in Central and South America.

Family 6. XENOPELTIDAE.—One species, *Xenopeltis unicolor*, in south-eastern Asia and Malay Islands. Boulenger rightly considers this snake in various ways intermediate between the Ilysiidae, *Boidae* and *Colubridae*. The prefrontal bones are still in contact with the nasals as in the previous families, but the coronoid bones of the mandibles are absent as in the remaining families, and this loss also occurs in the Boine *Charina*. The most remarkable feature is the dentary bone, which is movably attached to the much-elongated articular bone (cf. *Polyodontophis* of Colubrinae), the movability being enhanced by the absence of the coronoid. The quadrate is short and thick, and is carried by the broad and short squamosal, which lies flat against the skull, reminding in this respect of *Ilysia*. The smooth, black and brown scales of the back are highly iridescent, hence the generic name of this peculiar snake, which reaches the length of one yard.

Family 7. COLUBRIDAE.—Maxillaries horizontal and forming the greater portion of the upper jaw, which is toothed like the lower jaw; coronoid of mandible absent. Pterygoids connected with the quadrates which are carried by the squamosals, and these are loosely attached to the skull. Prefrontals not in contact with the basals. Ectopterygoids present. No vestiges of limbs or pelvis. This family comprises about nine-tenths of all recent species of snakes and is cosmopolitan, New Zealand being the most notable exception. The 1300 to 1400 species contain terrestrial, arboreal and aquatic forms, many of which are highly specialized.

Boulenger, adopting Duméril's terms, has divided them into three parallel series:—

A. *Aglypha.*—All the teeth are solid, and not grooved. Harmless, non-poisonous.

B. *Opisthoglypha.*—One or more of the posterior maxillary teeth are grooved. Most of these snakes, which number about 300 species, are moderately poisonous.

C. *Proteroglypha.*—The anterior maxillary teeth are grooved or "perforated." About 200 very poisonous species, *e.g.* cobras, coral-snakes and sea-snakes.

The second and third series containing only about 400 species, the Aglypha still present the appalling number of 1000 species, and even the grouping of this mass into three sub-families does not lighten the task of arranging the chaos, since one of these sub-families contains only one, and the other but a very few species. We have therefore still 1000 species, all so closely allied that they together are but of sub-family rank. They possess few reliable characters; their modifications are not weighty, and it is almost certain that some of these characters, and even combinations thereof, have been developed independently and in different countries. Many of the so-called genera, or groups of genera, are consequently not to be used either as witnesses of blood-relationship or of geographical distribution.

Some of the usual characters employed for systematic purposes, for the making of convenient keys, are the following: The number of rows of scales across the body and in a longitudinal direction; shape and structure of scales, whether smooth or with a longitudinal keel; arrangement of the shields on the head; shape of the contracted pupil. Above all, the dentition, which exhibits almost endless modifications, in most cases is difficult to ascertain and to appreciate in its subtle distinctions. Internal, skeletal characters, useless for ordinary practical purposes, are the various apophyses on the ventral side of the vertebrae and the penial armaments fancied by Cope.

It is impossible here to mention any but the more obvious genera and groups of colubrine snakes.

Series A. AGLYPHA.—Sub-family 1. *Acrochordinae.*—The few genera and species of these ugly-looking snakes are mostly aquatic, inhabiting rivers and estuaries of S.E Asia; but one, *Nothopsis*, lives on the Isthmus of Darien, and another, *Stoliczkaia*, is found in the Khasia Hills of N.E. India. *Acrochordus javanicus* has no enlarged ventral shields; the flat, viperish-looking head is covered with small granules, with the eyes and nostrils well on the upper surface. *Chersydrus* ranges from Madras to New Guinea; the body and tail are laterally compressed and form a ventral fold which is covered with tiny scales like the rest of the body. The main anatomical justification of this sub-family is given by the postfrontal bones, which, besides bordering the orbits posteriorly, are extended forwards so as to form the upper border of the orbits, separating the latter from the frontals.

Sub-family 2. *Colubrinae.*—The postfrontal bones are restricted to the posterior border of the orbits. The maxillary and dentary bones carry teeth on their whole length. This sub-family contains about 1000 species; few of them reach a length of more than two yards, some of the largest belonging to the Indian *Zaocys* s. *Coryphodon*, which grow to 10 ft. Most of them are oviparous. Some are more or less aquatic, others are absolutely arboreal, others again prefer dry, sandy or rocky localities according to their food. The sub-family is cosmopolitan, excepting the New Zealand sub-region, and finds its natural N. limit on the permanently frozen underground, where hibernation is of course impossible. Only a few out of the more than 120 genera can be mentioned here.

Coluber in Europe, Asia and North America. *C. longissimus* s. *flavescens* s. *aesculapii* was probably the species held in veneration by the ancient Romans. It grows to a length of 5 ft., climbs extremely well, feeds chiefly on mice, and becomes very tame. Its coloration varies from pale golden brown to black; the scales are smooth and shiny. Its original home is Italy and S.E. Europe, whence it has spread N. into S. Germany. Its occurrence at widely distant and isolated localities was formerly supposed to be due to its introduction by the Romans. *C. corais*, from the S. states of N. America far into S. America, reaches 8 ft. in length. *C. (Pityophis) sayi*, *C. catenifer* and others in N. America.

Coronella, widely distributed excepting Australia and S. America. *C. austriaca* s. *laevis*, the "smooth snake" of Europe, in England, in Hampshire and Dorsetshire, eats chiefly lizards; owing to its coloration, which varies much, it is often mistaken for the viper. *C. getula* is one of the many N. American species. *Zamenis* of Europe, Asia, N. Africa, N. and Central America, with many species, *e.g. Z. mucosus* the Indian "rat-snake," *Z. constrictor* in the United States. Some species of the Central and S. American genus *Urotheca* bear an extraordinary resemblance in coloration to the pretty, black, red and yellow poisonous *Elaps*. *Dendrophis* of India and Australia (*e.g. D. pictus* of India), and *Leptophis* s. *Ahaetulla* (*e.g. L. liocerus*, neotropical) may be taken as examples of long and slender tree-snakes.

Tropidonotus, with near 100 species, is cosmopolitan with the exception of New Zealand. Some of the species, like the Indian *T. quincunciatus* and *T. stolatus* and the N. American *T. ordinatus*, are perhaps more abundant as regards the number of individuals than any other snake. *T. natrix*, the grass or ringed snake, is very common in Europe, including England but not Scotland or Ireland; easily recognized even at a distance by two yellow or white spots which it has behind its head. It grows rarely to a length of 4 ft.; it never bites, and feeds chiefly on frogs, toads and fishes, but mice are never taken. Its eggs, which are of the size and shape of a dove's egg, are from fifteen to thirty in number, are deposited in mould or under damp leaves, and are glued together into one mass.

Polyodontophis of Madagascar, S.E. Asia and Central America is remarkable for having the dentary bones loosely attached to the apex of the elongated articular bone. *Calamaria* of Indo-China is an example of burrowing snakes, with a short tail and small eyes; in *Typhlopophis* of the Philippines the eyes are concealed.

Sub-family 3. *Rhachiodontidae*, represented by *Dasypeltis scabra* of tropical and S. Africa. Characterized by possessing only a few teeth, on the posterior part of the maxillaries, on the palatines and dentaries; some of the vertebrae in the lower region of the neck have strongly developed hypapophyses (not provided with a cap of enamel, as has often been asserted), which are directed forwards and pierce the oesophagus. The principal diet of these peculiar snakes seems to consist of eggs. In Cape Colony they are known as "eyervreter," *i.e.* egg-eater. A snake, scarcely 20 in. in length, and with a body not thicker than a man's little finger, is able to swallow a hen's egg, a feat which seems quite impossible. As the egg passes at last through the alarmingly distended neck, the snake makes some slight contortions and the swelling collapses, the shell having been filed through by the saw-like apparatus. Whilst the contents are thus retained without loss, the crumpled shell is then vomited out. This peculiar arrangement occurs also in an Indian snake, *Elachiston*, which represents, however, a sub-family of the Opisthoglypha. In another, probably also egg-eating snake, the Indian Coronelline *Nymphophidium*, the same effect is reached by two prominences at the base of the skull.

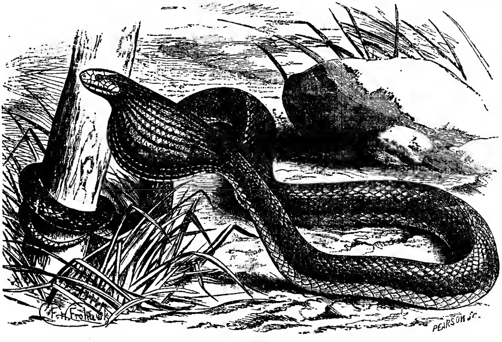

FIG. 7.—*Dasypeltis unicolor*, in the act of swallowing an egg.

Series B. OPISTHOGLYPHA.—One, or a few, of the posterior maxillary teeth have a groove or furrow in front, which conducts the secretion of the enlarged upper labial glands. They are all more or less poisonous, paralysing their prey before, or during the act of swallowing; the poison-fangs standing so far back in the mouth, these snakes cannot easily inflict wounds with them on man; moreover, the poison is not very strong and not available in large quantities. It may well be doubted whether Opisthoglypha form one genuine group instead of a heterogeneous assembly. They comprise about 300 species of terrestrial, arboreal and aquatic forms, and as a group they are almost cosmopolitan, including Madagascar, but excepting new Zealand.

Sub-family 1. *Dipsadomorphinae*.—Nostrils lateral; dentition well developed. Long-tailed, terrestrial and arboreal forms. The tree-snakes are mostly green above with the under parts white or yellow.

Coelopeltis, with concave, or grooved scales; *C. lacertina* s. *monspessulanus*, one of the largest European snakes in Mediterranean countries and south-western Asia.

Dipsadomorphus, *Dipsas*, *Leptognathus*, *Dryophis*, *Dendrophis* and other closely allied genera are typical, very long-bodied and long-tailed tree-snakes, chiefly tropical. The graceful form of their body, the elegance and rapidity of their movements, and the exquisite beauty of their colours have been the admiration of all who have had the good fortune to watch them in their native haunts. The majority lead an exclusively arboreal life; only a few descend to the ground in search of their food. They prey upon every kind of arboreal animal—birds, tree-frogs, tree-lizards, &c. All seem to be diurnal, and the larger kinds attain to a length of about 4 ft. The most beautiful of all snakes are perhaps certain varieties of *Chrysopelea ornata*, a species extremely common in the Indian Archipelago and many parts of the continent of tropical Asia. One of these varieties is black, with a yellow spot in the centre of each scale; these spots are larger on the back, forming a series of tetrapetalous flowers; the head is similarly ornamented. Another variety has a red back, with pairs of black crossbars, the bands of each pair being separated by a narrow yellow space; sides brown, dotted with black; belly dark green, the outer portion of each ventral shield being yellow, with a blackish spot.

The features by which the tree-snakes are distinguished are still more developed in the whip-snakes (*Dryophis*), whose excessively slender body has been compared to the cord of a whip. Although arboreal, like the former, they are nocturnal in their habits, having a horizontal instead of a round pupil of the eye. They are said to be of a fierce disposition, feeding chiefly on birds. In some of the species the elongate form of the head is still more exaggerated by a pointed flexible appendage of the snout (*Passerita*), which may be nearly half an inch in length, or leaf-like, as in the Madagascar *Langaha*. The Mexican *Trimorphodon* much resemble viperine snakes with the flat, triangular head, narrow neck, slit-like pupil and pugnacious disposition. A still more remarkable resemblance exists in the shape and striking, red, black and yellow coloration between *Scolecophis aemulus* of Chihuahua and the poisonous *Elaps fulvius*, the American coral-snake, but Cope has been careful to point out that these two creatures are not known to inhabit the same district.

Sub-family 2. *Elachistodonidae*.—Represented by *Elachistodon westermanni* of Bengal, with the same peculiar dentition and with sharp hypapophyses on the vertebrae of the lower neck, as described of *Dasypeltis* (see above).

Sub-family 3. *Homalopsinae*.—The nostrils of these absolutely aquatic, viviparous snakes are valvular and placed on the upper surface of the snout. The eyes are small, with vertical pupils. About two dozen ugly-looking species inhabit rivers and estuaries from Bengal to Australia. *Cerberus rhynchops*; *Hypsirhina plumbea*, *Homalopsis*; *Hipistes hydrinus* of Siam has a compressed body, and much resembles the Hydrophinae in general appearance and its partly marine life. *Herpeton* of Cambodia has a pair of long tentacles on the snout and is said to have a partly vegetable diet!

Series C. PROTEROGLYPHA.—The anterior maxillary teeth are deeply grooved, or so folded as to appear hollow or perforated. Behind these enlarged poison-fangs follows a series of smaller, solid teeth, hence the term "proteroglypha," which is intended to mean that the anterior teeth are grooved. These snakes are all very poisonous, mostly viviparous and found in all tropical and subtropical countries, with the exception of Madagascar and New Zealand.

Sub-family 1. *Elapinae.*—Terrestrial, with a cylindrical tail, comprising about 150 species which have been grouped into numerous genera, mostly upon very slight differences. The most remarkable are the following. *Naja tripudians* and *N. haje*, the cobra (*q.v.*). The largest species is the *N. bungarus* s. *elaps*, the "hamadryad," "snake-eating cobra," or king-cobra of Indian countries, reaching more than 12 ft. in length, and living mainly upon other snakes. *Sepedon haemachates*, of S. Africa, is named by the Boers "roode

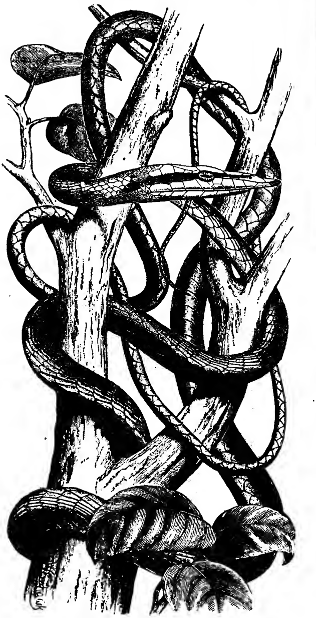

FIG. 8.—Indian Whip-Snake. *Passerita mycterizans.*

koper kapel" or "ring-hals," *i.e.* banded neck, the latter name being, however, often applied also to the cobra. It resembles in colour some varieties of the latter snake, and, like this, it has the power, though in a less degree, of expanding its hood. But its scales are keeled and its form is more robust. It is equally active and courageous, not rarely attacking persons who approach too near to its resting-place. In confinement it evinces great ferocity, opening its mouth and erecting its fangs, from which the poison is seen to flow in drops. During such periods of excitement it is even able, by the pressure of the muscles on the poison-duct, to eject the fluid to some distance; hence it shares with the cobra a third Dutch name, that of "spuw slang" (spitting snake). It grows to a length of 2 or 3 ft. Another kind is the "schapsticker" (sheep stinger), *S. rhombeatus*. It is extremely common in S. Africa, and extends far N. along the E. as well as W. coast. It is of smaller size than the preceding, and causes more injury to animals, such as sheep, dogs, &c. than to man. It varies in colour, but a black mark on the head like an inverted V remains nearly always visible.

The species of *Bungarus*, four in number, are extremely common in India, Burma, and Ceylon, and are distinguished by having only one row of undivided sub-caudal shields. Three of the species have the body ornamented with black rings, but the fourth and most common (*B. coeruleus*), the "krait" of Bengal, possesses a dull and more uniform coloration. The fangs of the bungarums are shorter than those of the cobras, and cannot penetrate so deeply into the wound. Their bite is therefore less dangerous and the effect on the general system slower, so that there is more prospect of recovery by treatment. Nevertheless, the krait is probably the most destructive snake to human life in India, since it is very common and often creeps into the houses. *Doliophis intestinalis* of Indo-China has enormously developed poison glands, which extend down the whole anterior third of the body, in front of the heart.

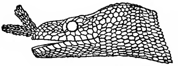

FIG. 9.—Head of *Herpeton tentaculatum.*

No part of the world possesses so many snakes of this sub-family as Australia, where, in fact, they replace the non-venomous colubrine snakes; many of them are extremely common and spread over a considerable area. Fortunately the majority are of small size, and their bites are not followed by more severe effects than those from the sting of a hornet. Only the following are dangerous to man and larger animals: the "death-adder," *Acanthopis antarcticus*, easily recognized by the peculiar end of the tail which is compressed and terminates in a thin horny spine; common throughout Australia to the Moluccas, scarcely one yard in length; the "black snake" (*Pseudechis porphyriacus*), likewise common throughout the Australian continent, especially in low marshy places, and upwards of 6 ft. in length; it is black, with each scale of the outer series red at the base; when irritated it raises the fore part of its body and flattens out its neck like a cobra, the females are sometimes known as "brown adders"; the "tiger-snake," *Notechis scutatus* (s. *Hoplocephalus curtus*), with a similar distribution, and also common in Tasmania, from 5 to 6 ft. long, and considered the most dangerous of the tribe. Good descriptions and figures of all these snakes are given in Krefft's *Snakes of Australia* (Sydney, 1869, 4to).

Several genera of the Elapinae lead a more or less burrowing life; their body is of a uniform cylindrical shape, terminating in a short tail, and covered with short polished scales; their head is short, the mouth rather narrow, and the eye small. They are the tropical American *Elaps*, the Indian *Callophis*, the African *Poecilophis* and the Australian *Vermicella*. The majority are distinguished by the beautiful arrangement of their bright and highly ornamental colours; many species of *Elaps* have the pattern of the so-called coral-snakes, their body being encircled by black, red and yellow rings—a pattern

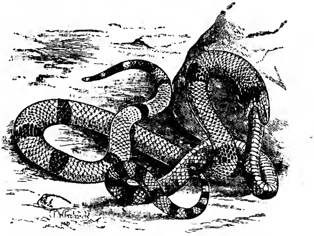

FIG. 10.—A Poisonous Snake (*Elaps fulvius*) swallowing a similarly coloured Opisthoglyphous Snake (*Homalocranium semicinctum*).

which is peculiar to snakes, venomous as well as non-venomous, of the fauna of tropical America. Although the poison of these narrow-mouthed snakes is probably as virulent as that of the preceding, man has much less to fear from them, as they bite only under great provocation. Moreover, their bite must be frequently without serious effect, owing to their narrow mouth and the small size of their poison-fangs. They are also comparatively of small size, only a few species rarely exceeding a length of 3 ft., for instance *Elaps fulvius*, which extends into the S. states of N. America.

Sub-family 2. *Hydrophinae.*—Tail laterally compressed; marine. Of sea-snakes some fifty species are known. All are inhabitants of the tropical Indo-Pacific ocean, and most numerous in and about the Persian Gulf, in the East Indian Archipelago, and in the seas between S. Japan and N. Australia. One species which is extremely common (*Pelamis bicolor*), and which is easily recognized by the black colour of its upper and the yellowish tints of its lower parts (both colours being sharply defined), has extended its range W. to the sea round Madagascar, and E. to the Gulf of Panama. One species, however, *Distira semperi*, is confined to the landlocked freshwater Lake Taal at Luzon in the Philippines. Sea-snakes are viviparous and pass their whole life in the water; they soon die when brought on shore. The scales are very small, often very much reduced, and there are frequently no enlarged ventrals on the compressed belly, but *Platurus* has broad ventrals. Their motions in the water are almost as rapid as they are uncertain and awkward when the animals are removed out of their proper element. Their nostrils are placed quite at the top of the snout. These openings are small and provided with a valve interiorly, which is opened during respiration, and closed when the animal dives. They have very capacious lungs, extending backwards to the anus; by retaining air in these extensive lungs they are able to float on the surface of the water and to remain under water for a considerable length of time. Sea-snakes shed their skin frequently; but it peels off in pieces as in lizards, and not as in the freshwater snakes, in which the integuments come off entire. Several species are remarkable for the extremely slender and prolonged anterior part of the body, and very small head. The eye is small, with round pupil, which is so much contracted by the light when the snake is taken out of the water that the animal becomes blinded and is unable to hit any object it attempts to strike. The tongue is short, and the sheath in which it lies concealed opens near to the front margin of the lower jaw; scarcely more than the two terminating points are exserted from the mouth when the animal is in the water. The mouth shuts in a somewhat different way from that of other snakes: the middle of the rostral shield is produced downwards into a small lobule, which prevents the water from entering the mouth; there is generally a small notch on each side of the lobule for the passage of the two points of the tongue. The food of sea-snakes consists entirely of small fish; among them species with very strong spines. As all these animals are killed by the poison of the snake before they are swallowed, and as their muscles are perfectly relaxed, their armature is harmless to the snake, which begins to swallow its prey from the head, and depresses the spines as deglutition proceeds. Sea-snakes belong to the most poisonous species of the whole order. Accidents are rarely caused by them, because they are extremely shy and swim away on the least alarm; but, when surprised in the submarine cavities forming their natural retreats, they will, like any other poisonous terrestrial snake, dart at the disturbing object; and, when out of the water, they attempt to bite every object near them, even turning round to wound their own bodies. They cannot endure captivity, dying in the course of two or three days, even when kept in capacious tanks. The greatest size to which some species attain, according to positive observation, is about 12 ft., and therefore far short of the statements as to the length of the so-called sea-serpents (*q.v.*). Boulenger has written an interesting account of sea-snakes in *Natural Science*, i. (1892), p. 44 seq.

FIG. 11.—Sea-Snake, *Pelamis bicolor*.

Family 8. *Amblycephalidae.*—The pterygoids are widely separated from the quadrates, not reaching beyond the level of the occipital condyle. This condition can be ascertained without dissection, when the mouth is opened widely. The squamosals are reduced to pad-like vestiges. Otherwise these snakes agree with the aglyphous Colubridae. Externally they are easily distinguished by the absence of a longitudinal groove on the skin. The head is thick, very distinct from the neck and the pupil is vertical, so that these harmless snakes look rather viperish. About 30 species, with several genera, are known from the oriental and neotropical regions. *Amblycephalus*, *e.g. monticola*, with compound body, in S.E. Asia.

Family 9. *Viperidae.*—The maxillaries are very short, movably pivoting upon the prefrontals and also attached to the ectopterygoids, so that they can be erected together with the large poison fangs, which, besides reserve teeth, are the only maxillary teeth. There are also teeth on the palatines, anterior portion of the pterygoids, and on the short dentaries. The short squamosals are very loosely attached to the skull. The prefrontals are not in contact with the nasals. The poison-fangs are "solenoglyphous," perforated, having a wide hole on the anterior side at the base, in connexion with the duct of the large, paired, poison-glands, the presence of which adds considerably to the characteristic broadness of the head. The hole leads into a canal, which opens as a semi-canal towards the end of the tooth. The supply of reserve teeth is indefinite; frequently one or two are lying ready and of equal size to the functional fangs.

All the Viperidae are very poisonous and all, except the African *Atractaspis*, are viviparous. They include terrestrial, semi-aquatic and burrowing types; none of them with any signs of degradation; on the contrary they belong to the most highly organized of snakes. The family is cosmopolitan, excepting Madagascar and the whole of the Australian region.

Sub-family 1. *Viperinae*, vipers (*q.v.*) or adders.—Without an external pit between eye and nose, and the maxillary bone is not hollowed out above. Absolutely restricted to the Old World, with 9 genera comprising about 40 species.

Sub-family 2. *Crotalinae.*—With a deep cavity or pit on either side between the eye and the nose, lodged in the hollowed-out maxillary bone. The lining of these pits is amply supplied with branches from the trigeminal nerves, but the function is still quite unknown. About 60 species of pit-vipers are recognizable. They can easily be divided into 4 genera: *Crotalus* and *Sistrurus* with a rattle at the end of the tail and restricted to America (see RATTLESNAKE); secondly, pit-vipers without a rattle: *Ancistrodon*, with large shields covering the upper surface of the head; with about 10 species, *e.g. A. halys* in the Caspian district, others in the Himalayas, Ceylon and Sunda islands. Notable American species are the following: *A. piscivorus*, the "water-viper" from Carolina and Indiana to Florida and Texas. This creature is semi-aquatic and lives chiefly on fishes; it grows to a length of about 5 ft.; the general colour is reddish to dark brown,

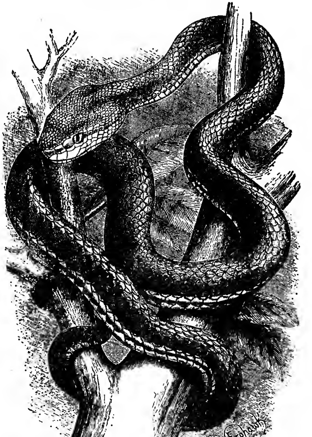

FIG. 12.—*Lachesis viridis* of India.

even blackish, with darker cross-bands or C-shaped markings; a dark, light-edged band extends from the eye to the angle of the mouth. The under parts are yellowish, more or less spotted or quite black. *A. contortrix* the "moccasin-snake" or "copper-head," so called because of its yellow to pink or pale-brown ground colour, with dark crossbars or triangular marks. The under surface is yellow to reddish, with dark specks. Full-grown specimens are about 1 yd. in length. The moccasin-snake ranges from Massachusetts and Kansas to Florida and Texas and into Mexico, preferring swampy localities or meadows with high grass, where it hunts for small mammals and birds. It is easily distinguished from other North

American pit-vipers by the possession of a loreal shield, *i.e.* a shield intercalated between the two preoculars and the posterior nasal; below the loreal lies the pit.

The moccasin and the water-viper have occasionally been mentioned under the name of *Trigonocephalus cenchris*, one of the many synonyms.

Lachesis has the upper surface of the head covered with very small shields, or with scales, and contains about 40 species, in S. and Central America, the Antilles and also in S.E. Asia. The most ill-famed is *L. s. Bothrops* s. *Craspedocephalus lanceolatus*, which inhabits the greater part of S. America, extending into Mexico and the Lower Antilles, notably Martinique, Guadaloupe and Santa Lucia, where it is known as the "Fer de Lance"; Mexicans call it "rabo de hueso" or bone-tail, on account of the curiously coloured and spike-like tip of the tail. It is a very quick and highly irascible beast and even known to turn on its pursuer. It grows to a length of 6 ft., lives in swamps, plantations, forests, on the plains and on the hills, and is very prolific, producing dozens of young, which at birth are 10 in. long and as vicious as their parents.

L. s *Trimeresurus gramineus* s. *viridis* s. *erythurus* is one of the Asiatic species, ranging over the whole of India to Hong-kong, Timor and even to the Andaman and Nicobar Islands. It is arboreal, bright green above; the end of the prehensile tail is usually bright red. (H. F. G.)

SNAPDRAGON, or ANTIRRHINUM (Gr. ῥίς, ῥινός, snout, from the shape of the flower), a plant of the natural order Scrophulariaceae (*q.v.*), native to central and south Europe, occurring as an alien on old walls in Britain. It is an old-fashioned garden perennial of easy cultivation. *Antirrhinum majus*, sown in heat, and forwarded until the general time for planting out, becomes a summer annual, and may be so treated; but under a slower and more hardy regime it may be sown in boxes in August, and pricked off into other boxes and wintered in a frame. So treated, and planted out in well-prepared beds of good friable garden soil, it will become very showy and effective. The "Tom Thumb" or dwarf strain, obtainable in self and mixed colours, is a very valuable plant for bedding. The named sorts are propagated by cuttings, and wintered in a frame. Some of the double-flowered sorts are interesting. There are forms with white, yellow, rose, crimson, magenta, and variously mottled and striped flowers, some of them of great beauty, but the named sorts are too fugitive to make it desirable to record a list.

SNEEK, a town in the province of Friesland, Holland, to the west of Sneek lake, 14 m by rail S.S.W. of Leeuwarden, with which it is also connected by canal. Steam tramways connect it S.E. with Heerenveen and N.W. with Bolsward and Harlingen. Pop. (1900) 12,075. Sneek is one of the great butter and cheese markets of the province. One of the former city gates (1615) remains, and there are a town hall, communal buildings (1863), court-house, weigh-house, synagogue and churches of various denominations, in one of which is the tomb of the naval hero of the 16th century, Lange, or Groote Pier (Long or Great Peter). The horse-fair of Sneek is widely attended, and there is a considerable activity in trade and shipping.

SNEEZING (O. Eng. *fnēosung*, from *fnēosan*, to sneeze, cf. Dutch *fniezen*, allied to the obsolete *neeze*, and ultimately to be referred to root seen in Gr. πνεῖν, to breathe; the initial *s* is due to association with numerous words, such as snort, snuff, snore, &c.), a violent expiration of air from the nose and mouth; it is an involuntary reflex respiratory act; caused by irritation of the nerve-endings of the mucous membrane of the nose or by stimulation of the optic nerve by a bright light. The irritation may be due to the swelling of the nasal mucous membrane, which occurs in catching cold, sneezing being often a premonitory or accompanying symptom, or to foreign bodies in the nose, as by inhalation of snuff or other "errhines" or "sternutatories." A venerable and widespread belief survives in the custom of saying "God bless you" when a person sneezes. The Hindus say "live," to which the answer "with you" is given (E. B. Tylor, *Primitive Culture*, i. 101). A sneeze was considered a sign or omen from the gods by the Greeks and Romans; it was one of the many common everyday occurrences which if coming at an important moment could be interpreted as presaging the future. There are many allusions to it in classical literature, *e.g.* Homer, *Od.* xvii. 561, Plutarch, *Themist.* 13, Xenophon, *Anab.* iii. 2 and Catullus, *Carm.* 45. There are references to it in Rabbinical literature, and it has been found in Otaheite, Florida and the Tonga Islands.

SNELL, HANNAH (1723–1792), the "female soldier," was born at Worcester on the 23rd of April 1723, being the daughter of a hosier. In order to seek her husband, who had ill-treated and abandoned her, in 1745 she donned man's attire and enlisted as a soldier in Guise's regiment of foot, but soon deserted, and shipped on board the sloop "Swallow" under her brother-in-law's name of James Gray. The "Swallow" sailed in Boscawen's fleet to the East Indies, and took part in the siege of Araapong. Hannah served in the assault on Pondicherry and was wounded, but she succeeded in extracting the bullet without calling in a surgeon. When recovered she served before the mast on the "Tartar" and the "Eltham," but when paid off she resumed woman's costume. Her adventures were published as *The Female Soldier, or the Surprising Adventures of Hannah Snell* (1750), and she afterwards gave exhibitions in military uniform in London. She died insane in Bethlehem Hospital on the 8th of February 1792.

SNELL, JOHN (1629–1679), founder of the Snell exhibitions at Oxford, was born in 1629 in Ayrshire, Scotland, the son of a blacksmith. He joined the royalists during the civil war, and fought in several battles, including Worcester. Thereafter he took refuge in Cheshire, where he met Sir Orlando Bridgeman, whose clerk he became, being raised to the offices of court-crier and seal-bearer as his patron was promoted to those of judge and Lord Keeper. Later he was secretary to the Duke of Monmouth and had the management of his Scottish estates. He died at Oxford on the 6th of August 1679, leaving a bequest for sending students from Glasgow University to an Oxford college or hall. The Court of Chancery decided in 1693 that Balliol should receive the beneficiaries.

SNELL, WILLEBRORD (1591–1626), commonly known as SNELLIUS, Dutch astronomer and mathematician, was born at Leiden in 1591. In 1613 he succeeded his father Rudolph Snell (1546–1613) as professor of mathematics in the university of Leiden. In 1615 he planned and carried into practice a new method of finding the dimensions of the earth, by determining the distance of one point on its surface from the parallel of another, by means of a triangulation. His work *Eratosthenes Batavus*, published in 1617, describes the method and gives as the result of his operations between Alkmaar and Bergen-op-Zoom a degree of the meridian equal to 55,100 toises = 117,449 yds. (A later recalculation gave 57,033 toises = 121,569 yds., after the application of some corrections to the measures indicated by himself.) Snell also distinguished himself as a mathematician, and discovered the law of refraction, in 1621 (see LIGHT). He died at Leiden on the 30th of October 1626.

In addition to the *Eratosthenes Batavus* he published *Cyclometria sive de circuli dimensione* (1621), and *Tiphys Batavus s. Histiodromice, de navium cursibus et re navali* (1624). He also edited *Coeli et siderum in eo errantium observationes Hassiacae* (1618), containing the astronomical observations of Landgrave William IV. of Hesse. A trigonometry (*Doctrina triangulorum,*) by him was published a year after his death.

SNIPE (O. Eng. *Snite*, Icel. *Snípa*, Dutch *Snip*, Ger. *Schnepfe*), one of the commonest Limicoline birds, in high repute no less for the table than for the sport it affords. It is the *Scolopax gallinago* of Linnaeus, but by later writers it has been separated from that genus, the type of which is the Woodcock (*q.v.*), and has been named *Gallinago caelestis*. Though considerable numbers are still bred in the British Islands, notwithstanding the diminished area suitable for them, most of those that fall to the gun are undoubtedly of foreign origin, arriving from Scandinavia towards the close of summer or later, and many will outstay the winter if the weather be not too severe, while the home-bred birds emigrate in autumn to return the following spring. Of later years British markets have been chiefly supplied from abroad, mostly from Holland.

The variegated plumage of the Snipe is subject to no inconsiderable variation, especially in the extent of dark markings on the belly, flanks, and axillaries, while examples are occasionally seen in which no trace of white, and hardly any of buff or grey, is visible, the place of these tints being taken by several shades of chocolate-brown. Such examples were long considered to form a distinct species, the *S. sabinii*, but its invalidity is now admitted. Other examples in which buff or rust-colour predominates have also been deemed distinct, and to those has been applied the epithet *russata*. Again, a slight deviation from the ordinary formation of the tail, whose rectrices normally number 14, and present a rounded termination, has led to the belief in a species, *S. brehmi*, now wholly discredited. But, setting aside two European species, there are at least a score, belonging to various parts of the world. Thus N. America produces *G. wilsoni*, so like the English Snipe as not to be easily distinguished except by the possession of 16 rectrices, and Australia has *G. australis*, a larger and somewhat differently coloured bird with 18 rectrices. India, while affording a winter resort to the common species, which besides Europe extends its breeding range over the whole of N. Asia, has also at this season the Pin-tailed Snipe, *E. stenura*, in which the number of rectrices is still greater, varying from 20 to 28, it is said, though 22 seems to be the usual number. This curious variability, deserving more attention than it has yet received, only occurs in the outer feathers of the series, which are narrow in form and extremely stiff, there being always 10 in the middle of ordinary breadth.

Those who only know the Snipe as it shows itself in the shooting-season, when without warning it rises from the boggy ground uttering a sharp note that sounds like *scape, scape*, and, after a few rapid twists, darts away, if it be not brought down by the gun, to disappear in the distance after a desultory flight, have no conception of the bird's behaviour at breeding-time. Then, though flushed quite as suddenly, it will fly round the intruder, at times almost hovering over his head. But, if he have patience, he will see it mount aloft and there execute a series of aerial evolutions of an astounding kind. After wildly circling about, and reaching a height at which it appears a mere speck, where it winnows a random zigzag course, it abruptly shoots downwards and aslant, and then as abruptly stops to regain its former elevation, and this process it repeats many times. A few seconds after each of these headlong descents a mysterious sound strikes his ear—compared by some to drumming, and by others to the bleating of a sheep or goat,[1] which sound evidently comes from the bird as it shoots downwards, and then only. It is now generally accepted that these sounds are produced by the vibration of the webs of the outer tail-feathers, the webs of which are modified. A similar sound may be made by affixing those feathers to the end of a rod and drawing them rapidly downwards in the same position as they occupy in the bird's tail while it is performing the feat.[2] The air will also ring with loud notes that have been syllabled *tinker, tinker, tinker*, while other notes in a different key, something like *djepp, djepp, djepp* rapidly uttered, may be heard as if in response. The nest is always on the ground, and is a rather deep hollow wrought in a tuft of herbage and lined with dry grass-leaves. The eggs are four in number, of a dark olive colour, blotched and spotted with rich brown. The young when freshly hatched are beautifully clothed in down of a dark maroon, variegated with black, white and buff.

The Double or Solitary Snipe of English sportsmen, *S. major*, a larger species, also inhabits N. Europe, and may be readily recognized by the white bars in its wings and by its 16 or occasionally 18 rectrices. It has also a very different behaviour. When flushed it rises without alarm-cry, and flies heavily. In the breeding season much of its love-performance is exhibited on the ground, and the sounds to which it gives rise are of another character; but the exact way in which its "drumming" is effected has not been ascertained. Its gesticulations at this time have been well described by Professor Collett in a communication to H. E. Dresser's *Birds of Europe* (vii. 635–637). It visits Great Britain every year at the close of summer, but in very small numbers, and is almost always seen singly—not uncommonly in places where no one could expect to find a Snipe.

The third species of which any details can here be given is the Jack-[3] or Half-Snipe, *S. gallinula*, the smallest and most beautifully coloured of the group. Without being as numerous as the common or full Snipe, it is of frequent occurrence in Great Britain from September to April (and occasionally both earlier and later); but it breeds only, so far as is known, in N. Scandinavia and Russia; and the first trustworthy information on that subject was obtained by J. Wolley in June 1853, when he found several of its nests near Muonioniska in Lapland.[4] Instead of rising wildly as do most of its allies, it generally lies so close as to let itself be almost trodden upon, and then takes wing silently, to alight at a short distance and to return to the same place on the morrow. In the breeding-season, however, it is as noisy and conspicuous as its larger brethren while executing its aerial evolutions.

As a group the Snipes are in several respects highly specialized. We may mention the sensitiveness of the bill, which, though to some extent noticeable in many Sandpipers (*q.v.*), is in Snipes carried to an extreme by a number of filaments, belonging to the fifth pair of nerves, which run almost to the tip and open immediately under the soft cuticle in a series of cells that give this portion of the surface of the premaxillaries, when exposed, a honeycomb-like appearance. Thus the bill becomes a most delicate organ of sensation, and by its means the bird, while probing for food, is at once able to distinguish the nature of the objects it encounters, though these are wholly out of sight. So far as is known the sternum of all the Snipes, except the Jack-Snipe, departs from the normal Limicoline formation, a fact which tends to justify the removal of that species to a separate genus, *Limnocryptes*.[5] (A. N.)

[1] Hence in many languages the Snipe is known by names signifying "Flying Goat," "Heaven's Ram," as in Scotland by "Heather-bleater."

[2] Cf. Meves, *Oefvers. K. Vet.-Akad. Förh.* (1856), pp. 275-277 (transl. *Naumannia*, 1858, pp. 116, 117), and *Proc. Zool. Society* (1858), p. 202, with Wolley's remarks thereon, *Zool. Garten* (1876), pp. 204–208; P. H. Bahr (*Proc. Zool. Soc. of London*, 1907, p. 12) has given a full account of the subject, with diagrams of the modified feathers.

SNIP SNAP SNOREM, an old game at cards, sometimes called *Earl of Coventry*. There are several methods of playing, but in the commonest a full whist pack is used and any number of players may take part. The pack is dealt, one card at a time, and the eldest hand places upon the table any card he likes. Each player in his turn then tries to match the card played just before his, making use of a prescribed formula if successful. Thus, if a king is played, the second player lays down another king (if he can) calling out "Snip!" The next player lays down the third king, saying "Snap!" and the next the fourth king with the word "Snorem." A player not being able to pair the card played may not discard, and the holder of "Snorem" has the privilege of beginning the next round. The player who gets rid of all his cards first wins a counter from his companions for each card still held by them.

SNOILSKY, CARL JOHAN GUSTAF, Count (1841–1903), Swedish poet, was born at Stockholm on the 8th of September 1841. He was educated at the Clara School, and in 1860 became a student at Upsala. He was trained for diplomacy, which he quitted for work at the Swedish Foreign Office. As early as 1861, under the pseudonym of "Sven Tröst," he began to print poems, and he soon became the centre of the brilliant literary society of the capital. In 1862 he published a collection of lyrics called *Orchideer* ("Orchids"). During 1864 and 1865 he was in Madrid and Paris on diplomatic missions. It was in 1869, when he first collected his *Dikter* under his own name, that Snoilsky took rank among the most eminent contemporary poets. His

[3] Though this word is clearly not intended as a nickname, such as is the prefix which custom has applied to the Daw, Pie, Redbreast, Titmouse or Wren, one can only guess at its origin or meaning. It may be, as in Jackass, an indication of sex, for it is a popular belief that the Jack-Snipe is the male of the common species; or, again, it may refer to the comparatively small size of the bird, as the "jack" in the game of bowls is the smallest of the balls used, and as fishermen call the smaller Pikes Jacks.

[4] His account was published by Hewitson in May 1855 (*Eggs Br. Birds*, 3rd ed., ii. pp. 356-358).

[5] The so-called Painted Snipes, forming the genus *Rhynchaea*, demand a few words. Four species have been described, natives respectively of S. America, Africa, India with China, and Australia. In all of these it appears that the female is larger and more brilliantly coloured than the male, and in the Australian species she is further distinguished by what in most birds is emphatically a masculine property, though its use is here unknown—namely, a complex trachea, while the male has that organ simple. He is also believed to undertake the duty of incubation.

Sonneter in 1871 increased his reputation. Then, for some years, Snoilsky abandoned poetry, and devoted himself to the work of the Foreign Office and to the study of numismatics. In 1876, however, he published a translation of the ballads of Goethe. Snoilsky had in 1876 been appointed keeper of the records, and had succeeded Bishop Genberg as one of the eighteen of the Swedish Academy. But in 1879 he resigned all his posts, and left Sweden abruptly for Florence with the Baroness Ruuth-Piper, whom he married in 1880. Count Snoilsky sent home in 1881 a volume of *Nya Dikter* (New Poems). Two other volumes of *Dikter* appeared in 1883 and 1887, and 1897; *Savonarola*, a poem, in 1883, and *Hvita frun* ("The White Lady") in 1885. In 1886 he collected his poems dealing with national subjects as *Svenska bilder* (2nd ed., 1895), which ranks as a Swedish classic. In 1891 he returned to Stockholm, and was appointed principal librarian of the Royal Library. He died at Stockholm on the 19th ot May 1903. His literary influence in Sweden was very great; he always sang of joy and liberty and beauty, and in his lyrics, more than in most modern verse, the ecstasy of youth finds expression. He is remarkable, also, for the extreme delicacy and melodiousness of his verse-forms.

His *Samlade dikter* were collected (Stockholm, 5 vols.) in 1903–1904.

SNORRI STURLASON (1179–1241), the celebrated Icelandic historian, the youngest son of a chief in the Vestfirðir (western fiords), was brought up by a powerful chief, Jon Loptsson, in Odda, who seems first to have awakened in him an interest for history and poetry. His career begins with his marriage, which made him a wealthy man; in 1206 he settled at Reykjaholt, where he constructed magnificent buildings and a bath of hewn stones, preserved to the present day, to which water was conducted from a neighbouring hot spring. He early made himself known as a poet, especially by glorifying the exploits of the contemporary Norse kings and earls; at the same time he was a learned lawyer, and from 1215 became the *lögsögumaðr*, or president of the legislative assembly and supreme court of Iceland. The prominent features of his character seem to have been cunning, ambition and avarice, combined with want of courage and aversion from effort. By royal invitation he went in 1218 to Norway, where he remained a long time with the young king Haakon and his tutor Earl Skuli. When, owing to disputes between Icelandic and Norwegian merchants, Skuli thought of a military expedition to Iceland, Snorri promised to make the inhabitants submit to Haakon of their own free will. Snorri himself became the *lendrmaðr*, vassal or baron, of the king of Norway, and held his lands as a fief under him. On his return home Snorri sent his son to the king as a hostage, and made peace between Norway and Iceland, but his power and influence were used more for his own enrichment and aggrandizement—he was *lögsögumaðr* again from 1222 to 1232—than for the advantage of the king. Haakon, therefore, stirred up strife between Snorri's kinsman Sturla and Snorri, who had to fly from Reykjaholt in 1236; and in 1237 he left the country and went back to Norway. Here he joined the party of Skuli, who was meditating a revolt. Learning that his cousin Sturla in Iceland had fallen in battle against Gissur, Snorri's son-in-law, Snorri, although expressly forbidden by his liege lord, returned to Iceland in 1239 and once more took possession of his property. Meanwhile Haakon, who had vanquished Skuli in 1240, sent orders to Gissur to punish Snorri for his disobedience either by capturing him and sending him back to Norway or by putting him to death. Gissur took the latter course, attacked Snorri at his residence, Reykjaholt, and slew him on the 22nd of September 1241.

Snorri is the author of the great prose *Edda* (see EDDA), and of the *Heimskringla or Sagas of the Norwegian Kings*, a connected series of biographies of the kings of Norway down to Sverri in 1177. The later work opens with the *Ynglinga Saga*, a brief history of the pretended immigration into Sweden of the Aesir, of their successors in that country, the kings of Upsala, and of the oldest Norwegian kings, their descendants. Next come the biographies of the succeeding Norwegian kings, the most detailed being those of the two missionary kings Olaf Tryggvason and St Olaf. Snorri's sources were partly succinct histories of the realm, as the chronological sketch of Ari; partly more voluminous early collections of traditions, as the *Noregs Konungatal* (*Fagrskinna*) and the *Jarlasaga*; partly legendary biographies of the two Olafs; and, in addition to these, studies and collections which he himself made during his journeys in Norway. His critical principles are explained in the preface, where he dwells on the necessity of starting as much as possible from trustworthy contemporary sources, or at least from those nearest to antiquity—the touchstone by which verbal traditions can be tested being contemporary poems. He inclines to rationalism, rejecting the marvellous and recasting legends containing it in a more historical spirit; but he makes an exception in the accounts of the introduction of Christianity into Norway and of the national saint St Olaf. Snorri strives everywhere to impart life and vigour to his narrative, and he gives the dialogues in the individual character of each person. Especially in this last he shows a tendency to epigram and often uses humorous and pathetic expressions. Besides his principal work, he elaborated in a separate form its better and larger part, the *History of St Olaf* (the great *Olaf's Saga*). In the preface to this he gives a brief extract of the earlier history, and, as an appendix, a short account of St Olaf's miracles after his death; here, too, he employs critical art, as appears from a comparison with his source, the Latin legend. See further ICELAND, *Literature*, and EDDA.

SNOW (in O. Eng. *snáw*; a common Indo-European word; cf. in Teutonic languages, Ger. *Schnee*, Du. *sneeuw*; in Slavonic *snieg'*, Lith. *snēgas*; Gr. *νίφα*, Lat. *nix*, *nivis*, whence the Romanic forms, Ital. *neve*, Fr. *neige*, &c.; Ir. and Gael. *sneachd*; the original sense of the root may be to moisten, cf. Skt. *sneha*, moisture), that form of precipitation of water-vapour condensed from the atmosphere which reaches the ground in a frozen and crystalline condition. Snow thus occurs when the processes of condensation and fall take place at a temperature below 32° F. The crystals, which vary greatly in form, belong to the hexagonal system. They are formed upon a nucleus, in the same way as a raindrop, and sometimes reach the ground singly, but more commonly in small coherent masses or flakes. If in its passage from the upper atmosphere snow passes through a temperature above 32° F. it reaches the ground as sleet or rain (according to the degree of heat encountered), and thus after a fall of rain over lowlands, the higher parts of mountains in the vicinity may be seen to have received the fall as snow.

See further CLIMATE and METEOROLOGY; and for the transformation of snow into ice under pressure, see GLACIER.

SNOWDON (*Wyddfa*, view-place, *Eryri*, eagle-place), the highest elevation in N. Wales. It is formed chiefly of slates, grits and porphyries of the Cambrian and Silurian systems. It consists of five "ribs" converging at the summit, 3560 ft. above sea-level. Between these lie such depressions as Cwm Glas (blue or green vale) to the N., and Cwm y llan (clearing, town or church vale) to the S. Snowdon is demarcated from the surrounding hills by passes famous for their scenery, such as that of Llanberis (*q.v.*) to the N.E. and Aberglaslyn to the S. These two passes are joined by Nant Gwynnant (stream, or valley, of the white or happy valley, or stream), skirting the S.E. flanks of the Snowdon *massif*. Nant Colwyn runs N.W. to Carnarvon. A rack-and-pinion railway (opened in 1897) ascends from Llanberis to the summit of the mountain ($4\frac{3}{4}$ m.). Snowdonia, as the locality is sometimes called, contains several lakes, *e.g.* Peris and Padarn at Llanberis; Glaslyn and Llydaw between Cribgoch (red crest) and Lliwedd; Cwellyn and others W. of the hill itself; and Gwynnant and Dinas (Y Ddinas) in Nantgwynnant.

SNOWDROP, *Galanthus nivalis*, the best known representative of a small genus of the order Amaryllidaceae, all the species of which have bulbs, linear leaves and erect flower-stalks, destitute of leaves but bearing at the top a solitary pendulous bell-shaped flower. The white perianth is six-parted, the outer three segments being larger and more convex than the inner series. The six anthers open by pores or short slits. The ovary is three-celled, ripening into a three-celled capsule. The snowdrop is a doubtful native of Great Britain, but is largely cultivated for market in Lincolnshire. There are numerous varieties, differing in the size of the flower and the period of flowering. Other distinct species of snowdrop are the Crimean snowdrop, *G. plicatus*, with broad leaves folded like a fan, and *G. Elwesii*, a native of the Levant, with large flowers, the three inner segments of which have a much larger and more conspicuous green blotch than the commoner kinds. All the species thrive in almost any soil or position, and when once planted should be left to themselves.

SNOW-LEOPARD, or Ounce (*Felis uncia,*) a large member of the cat family, from the high mountain regions of Central Asia. It resembles the leopard in general conformation, but has longer fur, grey in colour, marked with large dark rosettes. The dimensions of the head and body are about 4 ft. 4 in., tail 3 ft., and the height 2 ft. This animal lives among rocks, and preys upon wild sheep and goats, and probably large rodents or birds. It carries off sheep, goats and dogs from villages, and even kills ponies, but, it is said, has never been known to attack man (Blanford). Examples shown in the Zoological Gardens of London have been fairly tame and playful.

SNOW-LINE. In the higher latitudes, and in the most elevated parts of the surface of the earth, the atmosphere may be normally so cold that precipitation is chiefly in the form of snow, which lies in great part unmelted. The snow-line is the imaginary line, whether in latitude or in altitude, above which these conditions exist. In the extreme polar regions they exist at sea-level, but below lat. 78° the snow-line begins to rise, since at the lower elevations the snow melts in summer. In N. Scandinavia the line is found at about 3000 ft. above the sea, in the Alps at about 8500 ft., and on high mountains in the tropics at about 18,000 to 19,000 ft. These figures, however, can only be approximate, as many considerations render it impossible to employ the term " snow-line " as more than a convenient generalization.

SNOW-SHOES, a form of footgear devised for travelling over snow. Nearly every American Indian tribe has its own particular shape of shoe, the simplest and most primitive being those of the far north. The Eskimos possess two styles, one being triangular in shape and about 18 in. in length, and the other almost circular. Southward the shoe becomes gradually narrower and longer, the largest being the hunting snow-shoe of the Crees, which is nearly 6 ft. long and turned up at the toe. Of snow-shoes worn by people of European race that used by lumbermen is about $3\frac{1}{2}$ ft. long and broad in proportion, while the tracker's shoe is over 5 ft. long and very narrow. This form has been copied by the Canadian snow-shoe clubs, who wear a shoe about $3\frac{1}{2}$ ft. long and 15 to 18 in. broad, slightly turned up at the toe and terminating in a kind of tail behind. This is made very light for racing purposes, but much stouter for touring or hunting.

Snow-shoes are made of a single strip of some tough wood, usually hickory, curved round and fastened together at the ends and supported in the middle by a light cross-bar, the space within the frame thus made being filled with a close webbing of dressed caribou or neat's-hide strips, leaving a small opening just behind the cross-bar for the toe of the moccasined foot. They are fastened to the moccasin by leather thongs, sometimes by buckles. The method of walking is to lift the shoes slightly and slide the overlapping inner edges over each other, thus avoiding the unnatural and fatiguing " straddle-gait " that would otherwise be necessary. Immoderate snow-shoeing leads to serious lameness of the feet and ankles which the Canadian *voyageurs* call *mal de raquette.* Snow-shoe racing is very common in the Canadian snow-shoe clubs, and one of the events is a hurdle-race over hurdles 3 ft. 6 in. high. Owing to the thick forests of America the snow-shoe has been found to be more suitable for use than the Norwegian *ski,* which is, however, much used in the less-wooded districts.

SNUFF (from " to snuff, " *i.e.* to inhale, to draw in through the nose; cf. Dutch *snuf*, scent, Ger. *Schnupfen*, a cold, catarrh, and Eng. " snuffle, " " sniff, " &c.), the name of a powdered preparation of tobacco used for inhalation (for the manufacture see Tobacco). The practice of inhaling snuff became common in England in the 17th century, and throughout the 18th century it was universal. At first each quantity inhaled was fresh grated (Fr. *râper*), whence the coarser kinds were later known as " rappee. " This entailed the snuff-taker carrying with him a grater with a small spoon at one end and a box to hold the grated snuff at the other. Early 18th-century graters made of ivory and other material are in existence. Later the box and the grater were separated. The art and craft of the miniature painter, the enameller, jeweller and gold- and silver-smith was bestowed upon the box. The humbler snuff-takers were content with boxes of silver, brass or other metal, horn, tortoise-shell or wood. The mull (*q.v.*), a silver-mounted ram's head, is a large table snuff-box. Though " snuff-taking " ceased to be fashionable at the beginning of the 19th century, the gold and jewelled snuff-box has continued to be a typical gift of sovereigns to those whom they delight to honour.

This word " snuff " must be distinguished from that meaning the charred inch of a candle or lamp, which is a variant of " snip " or " snop, " to cut off, trim, cf. Dan. *snubbe.* Constant trimming or snuffing of candles was a necessity until obviated by the modern methods of candle manufacture, and the snuffers consisted of a pair of scissors with a closed box forming a receptacle for the charred wick cut off; the snuffers usually had three small feet which allowed them to stand on a tray. Made of silver, silver-gilt or other metal, " snuffers " were formerly a decorative article of plate in the equipment of a household. There is a beautiful example of silver snuffers with enamel decorations in the British Museum. These belonged to Cardinal Bainbridge and date from the reign of Henry VIII.

SNYDERS, FRANZ (1579–1657), Flemish painter of animals and still life, was born and died at Antwerp. In 1593 he was studying under Pieter Breughel the younger, and afterwards received instruction from Hendrick van Balen, the first master of Van Dyck. He devoted himself to painting flowers, fruit and subjects of still life, but afterwards turned to animal-painting, and executed with the greatest skill and spirit hunting pieces and combats of wild animals. His composition is rich and varied, his drawing correct and vigorous, his touch bold and thoroughly expressive of the different textures of furs and skins. His excellence in this department excited the admiration of Rubens, who frequently employed him to paint animals, fruit and still life in his own pictures, and he assisted Jordaens in a similar manner. In the lion and boar hunts which bear the name of Snyders the hand of Rubens sometimes appears. He was appointed principal painter to the archduke Albert, governor of the Low Countries, for whom he executed some of his finest works. One of these, a " Stag-Hunt, " was presented to Philip III., who commissioned the artist to paint several subjects of the chase, which are still preserved in Spain.

SOANE, SIR JOHN (1753–1837), English architect and art collector, was born near Reading of a humble family whose name of Swan he afterwards altered to Soan or Soane. His talent as a boy attracted the attention of George Dance, junior, the architect, who with other friends helped him on. He won the Royal Academy's silver (1772) and gold (1776) medals, and a travelling studentship, and went to Italy to study (1777–1780). Returning to England he got into practice as an architect, and in 1784 married a rich wife. He became architect to the Bank of England, which he practically rebuilt in its present form, and did other important public work. He became an A.R.A in 1795, and R.A. in 1802, and professor of architecture to the Royal Academy in 1806. In 1831 he was knighted. In his house in Lincoln's Inn Fields he brought together a valuable antiquarian museum (now the Soane Museum), which in 1835 he presented to the nation with an endowment; and there he died in 1837. (See Museums.)

SOAP, a chemical compound or mixture of chemical compounds resulting from the interaction of fatty oils and fats with alkalis. In a scientific definition the compounds of fatty acids with basic metallic oxides, lime, magnesia, lead oxide, &c., should also be included under soap; but, as these compounds are insoluble in water, while the very essence of a soap in its industrial relations is solubility, it is better to speak of the insoluble compounds as " plasters, " limiting the name " soap " as the compounds of fatty acids with soda and potash. Soap both as a medicinal and as a cleansing agent was known to Pliny (*H.N.* xxviii. 51), who speaks of two kinds—hard and soft—as used by the Germans. He mentions it as originally a Gallic invention for giving a bright hue to the hair (" rutilandis capillis "). There is reason to believe that soap came to the Romans from Germany, and that the detergents in use in earlier times and mentioned as soap in the Old Testament (Jer. ii. 22; Mal. iii. 2, &c.) refer to the ashes of plants and other such purifying agents (comp. vol. x. p. 697).

Soap appears to have been first made from goat's tallow and beech ash; in the 13th century the manufacture was established at Marseilles from olive oil, and in England during the next century. The processes and extent of the manufacture were revolutionized at about the beginning of the 19th century by Chevreul's classical investigations on the fats and oils, and by Leblanc's process for the manufacture of caustic soda from common salt.

Previous to Chevreul's researches on the fats (1811–1823) it was believed that soap consisted simply of a binary compound of fat and alkali. Claude J. Geoffroy in 1741 pointed out that the fat or oil recovered from a soap solution by neutralization with a mineral acid differs from the original fatty substance by dissolving readily in alcohol, which is not the case with ordinary fats and oils. The significance of this observation was overlooked; and equally unheeded was a not less important discovery by Scheele in 1783. In preparing lead plaster by boiling olive oil with oxide of lead and a little water—a process palpably analogous to that of the soap-boiler—he obtained a sweet substance which, called by himself "Ölsüss" ("principium dulce oleorum"), is now known as "glycerin." These discoveries of Geoffroy and Scheele formed the basis of Chevreul's researches by which he established the constitution of oils and the true nature of soap. In the article OILS it is pointed out that all fatty oils and fats are mixtures of glycerides, that is, of bodies related to the alcohol glycerin $C_3H_5(OH)_3$, and some fatty acid such as palmitic acid $(C_{16}H_{31}O_2)H$. Under suitable conditions

$$\underset{\text{Glycerin.}}{C_3H_5(OH)_3}+\underset{\text{Palmitic Acid.}}{3(C_{16}H_{31}O_2)H}\text{ give }\underset{\text{Palmitin.}}{C_3H_5(C_{16}H_{31}O_2)_3}+\underset{\text{Water.}}{3H_2O}$$

The corresponding decomposition of a glyceride into an acid and glycerin takes place when the glyceride is distilled in superheated steam, or by boiling in water mixed with a suitable proportion of caustic potash or soda. But in this case the fatty acid unites with the alkali into its potash or soda salt, forming a soap—

$$\underset{\text{Palmitin.}}{C_3H_5(C_{16}H_{31}O_2)_3}+\underset{\text{Caustic Soda.}}{3NaOH}=\underset{\text{Soap.}}{3NaC_{16}H_{31}O_2}+\underset{\text{Glycerin.}}{C_3H_5(OH)_3}$$

Of the natural fats or glycerides contained in oils the most important in addition to palmitin are stearin and olein, and these it may be sufficient to regard as the principal fatty bodies concerned in soap-making.

The general characters of a soap are a certain greasiness to the touch, ready solubility in water, with formation of viscid solutions which on agitation yield a tenacious froth or "lather," an indisposition to crystallize, readiness to amalgamate with small proportions of hot water into homogeneous slimes, which on cooling set into jellies or more or less consistent pastes. Soaps give an alkaline reaction and have a decided acrid taste; in a pure condition—a state never reached in practice—they have neither smell nor colour. Almost without exception potash soaps, even if made from the solid fatty acids, are "soft," and soda soaps, although made with fluid olein, are "hard"; but there are considerable variations according to the prevailing fatty acid in the compound. Almost all soda soaps are precipitated from their watery solutions by the addition of a sufficiency of common salt. Potash soap with the same reagent undergoes double decomposition—a proportion being changed into a soda soap with the formation of potassium chloride. Ammonia soaps have also been made, but with little commercial success; in 1906 H. Jackson patented the preparation of ammonium oleate directly in the washing water, and it is claimed that for cleansing articles it is only necessary to immerse them in the water containing the preparation and then rinse.

Soap when dissolved in a large amount of water suffers hydrolysis, with formation of a precipitate of acid salt and a solution containing free alkali. The reaction, however, is very complicated. Chevreul found that a neutral salt soap hydrolysed to an acid salt, free alkali, and a small amount of fatty acid. Rotondi in 1885, however, regarded a neutral soap as hydrolysing to a basic salt, soluble in both hot and cold water, and an acid salt, insoluble in cold and sparingly soluble in hot. Chevreul's views were confirmed in 1894 by Krafft and Stern. The extent to which a soap is hydrolysed depends upon the acid and on the concentration of the solution; it is also affected by the presence of metallic salts, *e.g.* of calcium and magnesium. As to the detergent action of a soap, Berzelius held that it was due to the free alkali liberated with water; but it is difficult to see why a solution which has just thrown off most of its fatty acids should be disposed to take up even a glyceride, and, moreover, on this theory, weak cold solutions, in which the hydrolysis is considerable, should be the best cleansers, whilst experience points to the use of hot concentrated solutions. It is more likely that the cleansing power of soap is due to the inherent property of its solution to emulsionize fats. This view is supported by Hillyer (*Jour. Amer. Chem. Soc.*, 1903, p. 524), who concluded that the cleansing power depended upon several factors, viz. the emulsionizing power, the property of penetrating oily fabrics, and lubricating impurities so that they can be readily washed away.

Resin soaps are compounds of soda or potash with the complex acids (chiefly abietic) of which coniferous resins consist. Their formation is not due to a true process of saponification; but they occupy an important place in compound soaps.

Manufacture.—Numerous varieties of soaps are made; the purposes to which they are applied are varied; the materials employed embrace a considerable range of oils, fats and other bodies; and the processes adopted undergo many modifications. As regards processes of manufacture soaps may be made by the direct combination of fatty acids, separated from oils, with alkaline solutions. In the manufacture of stearin for candles, &c., the fatty matter is decomposed, and the liquid olein, separated from the solid fatty acids, is employed as an ingredient in soap-making. A soap so made is not the result of saponification but of a simple combination, as is the case also with resin soaps. All other soaps result from the combination of fatty oils and fat with potash or soda solutions under conditions which favour saponification. The soap solution which results from the combination forms soap-size and is a mixture of soap with water, the excess alkali, and the glycerin liberated from the oil. In such condition ordinary soft soaps and certain kinds of hard soap are brought to the market. In curd soaps, however, which form the basis of most household soap, the uncombined alkali and the glycerin are separated by "salting out," and the soap in this condition contains about 30% of water. Soap may be framed and finished in this state, but almost invariably it receives a further treatment called "refining" or "fitting," in which by remelting with water, with or without the subsequent addition of other agents to harden the finished product, the soap may be made to contain from 60 to 70% of water and kept present a firm hard texture.

Almost any fatty substance can be employed in soap-making; but the choice is naturally restricted by the price of the fat and also the quality of the soap desired. The most important of the animal fats are those of the ox and hog, and of the vegetable oils cotton-seed and coco-nut; it is also to be remembered that resin, although not a fat, is also important in soap-making. Ox and sheep tallow, with the addition of resin, are the primary materials for making the hard yellow or primrose soaps; these tallows are often adulterated. The cheaper mottled and brown soaps have for their basis bone fat, obtained by treating bones with superheated steam or other methods. Lard yields lard oil, which is mainly applied in making hard toilet soaps. Curd soap and London grey mottled are prepared from kitchen or ship fat, whilst fuller's fat is employed in the manufacture of soft soaps. Of the vegetable oils, in addition to cotton-seed and coco-nut, olive oil is the basis of soaps for calico printers and silk dyers; castor oil yields transparent soaps (under suitable treatment), whilst crude palm oil, with bone fat, is employed for making brown soap, and after bleaching it yields ordinary pale or mottled. The alkalis are used almost exclusively in the condition of caustic lyes—solutions of their respective hydrates in water. Caustic soda is now obtained direct from the soda manufacturer, and one operation, causticizing the soda, is thus spared the soap-boiler. Potash lyes also may be bought direct, but in some cases they are sharpened or causticized by the soap-boiler himself from the carbonate.

The processes of soap manufacture may be classified (*a*) according to the temperatures employed into (1) cold processes and (2) boiling processes, or (*b*) according to the nature of the starting material—acid or oil and fat—and the relative amount of alkali, into (1) direct saturation of the fatty acid with alkali, (2) treating the fat with a definite amount of alkali with no removal of unused lye, (3) treating the fat with an indefinite amount of alkali, also with no separation of unused lye, (4) treating the fat with an indefinite amount of alkali with separation of waste lye. In the second classification (2) is typical of the "cold" process, whilst (1), (3), (4) are effected by the "boiling" process.

The cold process, which is only applicable to the manufacture of soaps from readily saponifiable oils, such as those of the coco-nut oil group and also from castor oil, is but little used. In it the oils at 35° C. are stirred with concentrated alkali in an iron or wooden tub, whereupon saponification ensues with a development of some heat; the mixture being well agitated. After a few hours the mixture becomes solid, and finally transparent; at this point the perfume is added, and the product framed and crutched (see under *Marine Soap*). By blending the coco-nut oil with other less saponifiable substances such as tallow, lard, cotton-seed oil, &c., and effecting the mixing and saponification at a slightly higher temperature, soaps are obtained which resemble milled toilet soaps. Soaps made by this process contain the glycerin originally present in the oil, but, in view of their liability to contain free alkali and unsaponified oil, the process has been largely given up.

The process of soap-boiling is carried out in large iron boilers called "soap pans" or "coppers," some of which have capacity for a charge of 30 tons or more. The pan proper is surmounted by a great cone or hopper called a curb, to provide for the foaming up of the boiling mass and to prevent loss from overflowing. Formerly the pans were heated by open firing from below; but now the almost universal practice is to boil by steam injected from perforated pipes coiled within the pan, such injection favouring the uniform heating of the mass and causing an agitation favourable to the ultimate mixture and saponification of the materials. Direct firing is used for the second boiling of the soap mixture; but for this superheated steam may with advantage be substituted, either applied by a steam jacket round the pan or by a closed coil of pipe within it. In large pans a mechanical stirring apparatus is provided, which in some cases, as in Morfit's steam "twirl," is formed of the steam-heating tubes geared to rotate. Autoclaves, in which the materials are boiled under pressure, are also employed for certain soaps.

The process of manufacturing soaps by boiling fatty acids with caustic alkalis or sodium carbonate came into practice with the development of the manufacture of candles by saponifying fats, for it provided a means whereby the oleic acid, which is valueless for candle making, could be worked up. The combination is effected in open vats heated by a steam coil and provided with a stirring appliance; if soda ash be used it is necessary to guard against boiling over. (See under *Curd Soap.*)

Curd Soap.—This variety is manufactured by boiling the fat with alkali and removing the unused lye, which is afterwards worked up for glycerin. The oil mixture used differs in the several manufacturing countries, and the commercial name of the product is correspondingly varied. In Germany tallow is the principal fat; in France olive oil occupies the chief place and the product is known as Marseilles or Castile soap; and in England tallow and palm oil are largely used. But in all countries a mixture of several oils enters into the composition of curd soaps and the proportions used have no fixity. For each ton of soap to be made from 12 to 16 cwt. of oil is required. The soap pan is charged with the tallow or other fat, and open steam is turned on. So soon as the tallow is melted a quantity of weak lye is added, and the agitation of the injected steam causes the fat and lye to become intimately mixed and produces a milky emulsion. As the lye becomes absorbed, a condition indicated by the taste of the goods, additional quantities of lye of increasing strength are added. After some time the contents of the pan begin to clear and become in the end very transparent. Lye still continues to be poured in till a sample tastes distinctly alkaline—a test which indicates that the whole of the fatty acids have been taken up by and combined with the alkali. Then without further addition of alkali the boiling is continued for a few minutes, when the soap is ready for salting out or "graining." Either common salt or strong brine in measured quantity is added to the charge, and, the soap being insoluble in such salt solution, a separation of constituents takes place: the soap collects on the surface in an open granular condition, and the spent lye sinks to the bottom after it has been left for a short time to settle. Suppose that a pure soap without resin is to be made—a product little seen in the market—the spent lye is run off, steam is again turned on, pure water or very weak lye run in, and the contents boiled up till the whole is thin, close and clear. The soap is from this again grained off or salted out, and the underlye so thrown down carries with it coloured impurities which may have been in the materials or which arise from contact with the boiler. Such washing process may have to be repeated several times when impure materials have been used. The spent lye of the washing being drained off, the soap is now "boiled for strength." Steam is turned on, and, the mass being brought to a clear condition with weak lye or water, strong lye is added and the boiling continued with close steam till the lye attains such a state of concentration that the soap is no longer soluble in it, and it will separate from the caustic lye as from a common salt solution. The contents of the pan are once more allowed to cool and settle, and the soap as now formed constitutes a pure curd coap, carrying with it some proportion of uncombined alkali, but containing the minimum amount of water. It may be skimmed off the underlye and placed direct in the frames for solidification; but that is a practice scarcely at all followed, the addition of resin soap in the pan and the subsequent "crutching in" of silicate of soda and adulterant mixings being features common to the manufacture. The lye from the strengthening boil contains much alkali and is used in connexion with other boilings.

Mottled Soap.—A curd soap prepared from kitchen fat or bone grease always carries with it into the cooling frame a considerable amount of coloured impurity, such as iron sulphate, &c. When it is permitted to cool rapidly the colouring matter remains uniformly disseminated throughout the mass; but when means are taken to cause the soap to cool and solidify slowly a segregation takes place: the stearate and palmitate form a semi-crystalline solid, while the oleate, solidifying more slowly, comes by itself into translucent veins, in which the greater part of the coloured matter is drawn. In this way curd, mottled or marbled soap is formed, and such mottled appearance was formerly highly valued as an indication of freedom from excess of water or other adulteration, because in fitted soaps the impurities are either washed out or fall to the bottom of the mass in cooling. Now, however, the mottled soaps, blue and grey, are produced by working colouring matter, ultramarine for blue, and manganese dioxide for grey, into the soap in the frame, and mottling is very far from being a certificate of excellence of quality.

Yellow Soap consists of a mixture of any hard fatty soap with a variable proportion—up to 40% or more—of resin soap. That substance by itself has a tenacious gluey consistence, and its intermixture in excess renders the resulting compound soft and greasy. The ordinary method of adding resin consists in stirring it in small fragments into the fatty soap in the stage of clear-boiling; but a better result is obtained by separately preparing a fatty soap and the resin soap, and combining the two in the pan after the underlye has been salted out and removed from the fatty soap. The compound then receives its strengthening boil, after which it is fitted by boiling with added water or weak lye, continuing the boil till by examination of a sample the proper consistency has been reached. On settling the product forms three layers: the uppermost is a thin crust of soap which is worked up again in the pan; the second is the desired soap; next there is a dark-coloured weak soap termed nigre, which, because it contains some soap and alkali is saved for future use; underneath these is a solution of alkaline salts with a little free alkali.

Treatment of Settled Soap.—The upper layer having been removed, the desired soap is ladled out or ran off to a crutcher, which is an iron pan provided with hand or mechanical stirring appliances. It is here stirred till it becomes ropy, and the perfume, colour or any other substance desired in the soap is added. The soap is now ready for framing. The frames into which hard soaps are ladled for cooling and solidification consist of rectangular boxes made of iron plates and bound and clamped together in a way that allows the sides to be removed when required; wooden frames are used in the case of mottled soaps. The solidification is a very gradual process, depending, of course, for its completion on the size of the block; but before cutting into bars it is essential that the whole should be set and hardened through and through, else the cut bars would not hold together. Many ingenious devices for forming bars have been produced; but generally a strong frame is used, across which steel wires are stretched at distances equal to the size of the bars to be made, the blocks being first cut into slabs and then into bars.

Marine Soap.—These soaps are so named because they are not insoluble in a strong solution of salt; hence they form a lather and can be used for washing with sea-water. Being thus soluble in salt water it cannot, of course, be salted out like common soaps; but if a very concentrated salt solution is used precipitation is effected, and a curd soap is separated so hard and refractory as to be practically useless. Coco-nut soap (see above) is typical of this class. Its property of absorbing large proportions of water, up to 80%, and yet present the appearance of a hard solid body, makes the material a basis for the hydrated soaps, smooth and marbled, in which water, sulphate of soda, and other alkaline solutions, soluble silicates, fuller's earth, starch, &c. play an important and bulky part. Coconut soap also forms a principal ingredient in compound soaps meant to imitate curd and yellow soaps. Two principal methods of preparing such compound soaps are employed. In the first way the ordinary oil and the coco nut oil are mixed and saponified together as described above. According to the second plan, the ordinary oil is treated as for the preparation of a curd soap, and to this the coconut soap separately saponified is added in the pan and both are boiled together till they form a homogeneous soap.

Silicate Soaps.—A further means of enabling a soap to contain large proportions of water and yet present a firm consistence is found in the use of silicate of soda. The silicate in the form of a concentrated solution is crutched or stirred into the soap in a mechanical mixing machine after the completion of the saponification, and it appears to enter into a distinct chemical combination with the soap. While silicate soaps bear heavy watering, the soluble silicate itself is a powerful detergent, and it possesses certain advantages when used with hard waters.

Soft Soap.—Soft soaps are made with potash lyes, although in practice a small quantity of soda is also used to give the soap some consistence. There is no separation of underlyes in potash soap, consequently the product contains the whole constituents of the oils used, as the operation of salting out is quite impracticable owing to the double decomposition which results from the action of salt, producing thereby a hard principally soda soap with formation of potassium chloride. Owing to this circumstance it is impossible to "fit" or in any way purify soft soap, and all impurities which go into the pan of necessity enter into the finished product. The making of soft soap, although thus a much less complex process than hard soap making, is one that demands much skill and experience for its success. From the conditions of the manufacture care must be taken to regulate the amount and strength of the alkali in proportion to the oil used, and the degree of concentration to which the boiling ought to be continued has to be determined with close observation.

Toilet Soaps, &c.—Soaps used in personal ablution in no way differ from the soaps previously alluded to, and may consist of any of the varieties. It is of consequence that they should, as far as possible, be free from excess of alkali and all other salts and foreign ingredients which may have an injurious effect on the skin. The manufacturer of toilet soap generally takes care to present his wares in convenient form and of agreeable appearance and smell; the more weighty duty of having them free from uncombined alkali is in many cases entirely overlooked. Transparent soaps are prepared by dissolving ordinary soap in strong alcohol and distilling off the greater portion of the alcohol till the residue comes to the condition of a thick transparent jelly. This, when cast into forms and allowed to harden and dry slowly, comes out as transparent soap. A class of transparent soap may also be made by the cold process, with the use of coco-nut oil, castor oil and sugar. It generally contains a large amount of uncombined alkali, and that, with its unpleasant odour of coco-nut oil, makes it a most undesirable soap for personal use. Toilet soaps of common quality are perfumed by simple melting and stirring into the mass some cheap odorous body that is not affected by alkalis under the influence of heat. The finer soaps are perfumed by the cold method; the soap is shaved down to thin slices, and the essential oil kneaded into and mixed with it by special machinery, after which it is formed into cakes by pressure in suitable moulds. The greater quantity of high-class toilet soaps are now made by a milling process. A high class soap, which after framing contains about 30% of water, is brought down to a water content of 11-14% by drying in chambers through which warm air is circulated. The soap is now milled in the form of ribbons with the perfume and colouring matter, and the resulting strips are welded into bars by forcing through a heated nozzle. The bars are then cut or moulded into tablets, according to the practice of the manufacturer.

Glycerin soap ordinarily consists of about equal parts of pure hard soap and glycerin (the latter valuable for its emollient properties). The soap is melted by heat, the glycerin is stirred in, and the mixture strained and poured into forms, in which it hardens but slowly into a transparent mass. With excess of glycerin a fluid soap is formed, soap being soluble in that body, and such fluid soap has only feeble lathering properties. Soap containing small proportions of glycerin, on the other hand, forms a very tenacious lather, and when soap bubbles of an enduring character are desired glycerin is added to the solution. Soaps are also prepared in which large proportions of fine sharp sand, or of powdered pumice, are incorporated, and these substances, by their abrading action, powerfully assist the detergent influence of the soap on hands much begrimed by manufacturing operations.[1]

Medicated soaps, first investigated scientifically by Unna of Hamburg in 1886, contain certain substances which exercise a specific influence on the skin. A few medicated soaps are prepared for internal use, among which are croton soap and jalap soap, both gentler cathartics than the uncompounded medicinal principles. Medicated soaps for external use are only employed in cases of skin ailments, as prophylactic washes and as disinfectant soaps. Among the principal varieties are those which contain carbolic acid and other ingredients of coal tar, salicylic acid, petroleum, borax, camphor, iodine, mercurial salts, sulphur and tannin. Arsenical soap is very much employed by taxidermists for the preservation of the skins of birds and mammals.

Miscellaneous Soaps.—The so-called "floating soaps" are soaps made lighter than water either by inserting cork or a metallic plate so as to form an air space within the tablet. The more usual method is to take milling soap, neutralize it with sodium bicarbonate or a mixture of fatty acids, and, after perfuming, it is aerated by mixing the hot soap with air in a specially designed crutcher. Shaving soaps, which must obviously be free from alkali or any substance which irritates the skin, are characterized by readily forming a permanent lather. This property is usually obtained by mixing soft and hard soaps, or, more rarely, by adding gum tragacanth to a hard soap. In the textile trades the wool scourer employs a neutral olive-oil soap, or, on account of its cheapness, a neutral curd or curd mottled hrand; the cotton cleanser, on the other hand, uses an alkaline soap, but for cleaning printed cottons a neutral olive-oil curd soap is used, for, in this case, free alkali and resin are objectionable; olive-oil soap, free from caustic alkali, but often with sodium carbonate, is also used in cleansing silk fibres, although hard soaps free from resin are frequently employed for their cheapness. Soaps of smaller moment are the pearl ash soaps used for removing tarry stains; ox-gall soaps for cleaning carpets; magnesia, rouge and chalk soaps for cleaning plate, &c.

Soap Analysis.—The most important points in soap analysis are (1) determination of the fatty matter, (2) of the total alkali, (3) of the substances insoluble in water, (4) of the water. The first is carried out by saponifying the soap with acid in the heat when the fatty acids come to the surface. If it fails to form a hard cake on cooling, a known weight of wax may be added and the product re-heated. The cake on weighing gives the free acid. The total alkali is determined by incinerating a weighed sample in a platinum dish, dissolving the residue in water, filtering and titrating the filtrate with standard acid. The residue on the filter paper gives (3) the substances insoluble in water. The water in a soap is rarely directly determined; when it is, the soap, in the form of shavings, is heated to 105° C. until the weight is constant, the loss giving the amount of water. With genuine soaps, however, it suffices to calculate the fatty acids as anhydrides and add to this the amount of alkalis, and estimate the water by difference. The complete analysis involves an examination of the fatty matter, of the various forms in which the alkalis are present—free and combined glycerin, &c.

Commerce.—Marseilles has long been recognized as the most important centre of the soap trade, a position that city originally achieved through its ready command of the supplies of olive oil. The city is still very favourably situated for obtaining supplies of oils both local and foreign, including sesame, ground nut, castor oil, &c. In England, during the reign of Charles I., a monopoly of soap-making was farmed to a corporation of soap-boilers in London—a proceeding which led to serious complications. From 1712 to 1853 an excise duty ranging from 1d. to 3d. was levied on soap made in the United Kingdom, and that heavy impost (equal when 3d. to more than cost) greatly impeded the development of the industry. In 1793, when the excise duty was 2¼d. on hard and 1¾d. on soft soap, the revenue yielded was a little over £400,000; in 1815 it was almost £750,000; in 1835, when the duty was levied at 1½d. and 1d. respectively (and when a drawback was allowed for soap used in manufactures), the revenue was almost £1,000,000; and in 1852, the last year in which the duty was levied, it amounted to £1,126,046, with a drawback on exportation amounting to £271,000.

Medicine.—Two preparations of hard soap (sodium oleate), made by acting on olive oil with caustic soda, are used in medicine: (1) *Emplastrum saponis*, made with lead plaster; (2) *Pilula saponis composita*, which contains one in five parts of opium. Soft or green soap (potassium oleate), made by acting on olive oil with caustic potash, is also used; its preparation (*Linamentum saponis*) is known as opodeldoc. Curd soap is also used, and is chiefly a stearate of sodium. The chief use of hard soap is in enemata, and as a suppository in children suffering from constipation; it also forms the basis of many pills; given in warm water it forms a ready emetic in cases of poisoning. Soft soap is used by dermatologists in the treatment of chronic eczema, and opodeldoc is a domestic remedy for stiffness and sprains. Medicated soaps are made by adding the drug to either hard soap or curd soap in the desired proportions. Useful combinations are: borax 10%, carbolic acid 5%, ichthyol 5%, sublimed sulphur 10%, thymol 2½%, &c.

See L. L. Lamborn, *Modern Soaps, Candles and Glycerin* (1906); W. H. Simmons and H. A. Appleton, *The Handbook of Soap Manufacture* (1908); also J. Lewkowitsch, *Oils, Fats and Waxes*.

SOAP-BARK, the inner bark of *Quillaja saponaria*, a large tree which grows in Chile. Reduced to powder, it is employed as a substitute for soap, since it forms a lather with water, owing to the presence of a glucoside saponin, sometimes distinguished as *Quillai saponin*. The same, or a closely similar substance, is found in soapwort (*Saponaria officinalis*), in senega root (*Polygala senega*) and in sarsaparilla; it appears to be chemically related to digitonin, which occurs in digitalis. The saponins (with few exceptions) have the general formula $(C_nH_{2n-8}O_{10}$, and by the action of dilute acids they are hydrolysed into sugars and sapogenins, which are usually inert pharmacologically. An alternative name for them, and especially for those which are pharmacologically active, is *sapotoxins*; on this nomenclature the hydrolytic products are termed saponins. Applied as a snuff to the mucous membrane of the nose, saponin (either in soap-bark or in senega root) promotes a violent sneezing. Solutions injected under the skin are violent local irritants and general depressants.

SOBAT, a river of N.E. Africa, the most southerly of the great eastern affluents of the Nile. It is formed by the junction of various streams which rise in the S.W. of the Abyssinian highlands and N.W. of Lake Rudolf. The length of the Sobat, reckoning from the source of the Baro, the chief upper stream, to the confluence with the Nile is about 460 m. The Baro rises in about 36° 10′ E., 7° 50′ N. at an altitude of some 7000 ft. It has a general W. direction with a slight N. tendency. It is joined by numerous other streams which also rise on the Abyssinian plateau. These mountain torrents descend the escarpment of the plateau between great walls of rock, the Baro dropping 3000 ft. in 45 m. It then flows through a narrow gorge at an altitude of about 2000 ft., the mountains on either side towering 3000 to 4000 ft. above the river bed. Just east of 35′ E. the Birbir, descending from the plateau, joins the Baro and brings with it a large volume of water. Some 40 m. lower down the hills are left behind, the rocks and rapids in the bed of the Baro cease, and the river flows W. across a vast plain with many windings and several divergent channels. From Gambela, a town on its N. bank 20 m. below the Birbir junction, the river is

[1] "Soap powders" and "soap extracts" are powdered mixtures of soaps, soda ash or ordinary sodium carbonate.

navigable by steamers during flood time (June-December) to the point of confluence with the White Nile. From the N. the Baro is joined by two considerable rivers which also rise in the rampart of hills that separates Abyssinia from the Sudan, but its chief tributaries are from the S. In about 33° 20′ E., 8° 30′ N., it is joined by the Pibor. This river issues from the swamp region east of Bor on the Bahr-el-Jebel stretch of the Nile and flows N.E. and N. It is joined from the E. and S. by various streams having their sources on the W. slopes of the Kaffa plateau. Of these the chief are the Gelo—which breaks through a gap in the mountains in a series of magnificent cascades—and the Akobo. The Akobo rises in about 6° 30′ N., 35° 30′ E., and after leaving the mountains flows N.W. through flat swampy tracts. The whole region of the lower Pibor and Baro is one of swamps, caused by the rivers overflowing their banks in the rainy season. At its junction with the Baro the Pibor is over 100 yds. wide, with a depth of 8 ft. and a speed of 2·3 ft. per second.

Below the confluence of the Pibor and Baro the united stream, now known as the Sobat, takes a decided N.W. trend, passing for some distance through a region of swamps. Just beyond the swamps and some 40 m. below the confluence, is the fortified post of Nasser. From this point the ground on either side of the river gradually rises, though on the S. it is liable to inundation during flood time. From Nasser to the junction of the Sobat with the Nile the river has a course of about 180 m. As it approaches the Nile the Sobat flows in a well-defined channel cut in the alluvial plains through which it passes. The banks become steep, the slope rapid and the current strong. Several *khors* join it from N. and S., some being simply spill channels. These channels or "loops" are a characteristic feature of the river. The Sobat enters the Nile almost at right angles in 9° 22′ N., 31° 31′ E. It is 400 ft. wide at its mouth and has a depth of 18 to 20 ft. at low water and of 30 ft. when in flood. The colour of the water when in moderate flood is that of milk, and it is from this circumstance that the Nile gets its name of Bahr-el-Abiad, *i.e.* White River. In full flood the colour of the Sobat is a pale brick red. The amount of alluvium brought down is considerable. For the part played by the Sobat in the annual rise of the Nile see NILE.

The Sobat was ascended for some distance in 1841 by the Egyptian expedition despatched in the previous year to explore the upper Nile. The post of Nasser (see above) was founded in 1874 by General C. G. Gordon when governor of the equatorial provinces of Egypt, and it was visited in 1876 by Dr W. Junker, the German explorer. The exploration of the river system above Nasser was carried out in the last decade of the 19th century by the Italian explorer V. Bottego, by Colonel (then Captain) Marchand, of the French army, who, on his way from Fashoda to France, navigated the Baro up to the foot of the mountains; and by Captain M. S. Wellby, Majors H. H. Austin and R. G. T. Bright, of the British army, and others. By the agreement of the 15th of May 1902 between Great Britain and Abyssinia the lower courses of the Pibor and Baro rivers to their point of confluence form the frontier between the Anglo-Egyptian Sudan and Abyssinia.

See NILE, SUDAN and ABYSSINIA. (W. E. G.; F. R. C.)

SOBRAON, a decisive battle in the first Sikh War (see SIKH WARS). It was fought on the 16th of February 1846, between the British (15,000) under Sir Hugh Gough and the Sikhs (20,000) under Tej Singh and Lal Singh. The Sikhs had fortified themselves in a bend on the left bank of the Sutlej, with the river in their rear. The battle began with a two hours' artillery duel, in which the Sikh guns were the more powerful, and the British heavy guns expended their ammunition. Then the infantry advanced with the bayonet, and after a fierce struggle took the Sikh entrenchments. The Sikh losses were estimated at from 5000 to 8000. This battle ended the first Sikh War.

SOBRIQUET, a nickname or a fancy name, usually a familiar name given by others as distinct from a "pseudonym" assumed as a disguise. Two early variants are found, *sotbriquet* and *soubriquet*; the latter form is still often used, though it is not the correct modern French spelling. The first form suggests a derivation from *sot*, foolish, and *briquet*, a French adaptation of Ital. *brichetto*, diminutive of *bricco*, ass, knave, possibly connected with *briccone*, rogue, which is supposed to be a derivative of Ger. *brechen*, to break; but Skeat considers this spelling to be due to popular etymology, and the real origin is to be sought in the form *soubriquet*. Littré gives an early 14th century *soubsbriquet* as meaning a "chuck under the chin," and this would be derived from *soubs*, mod. *sous* (Lat. *sub*), under, and *briquet* or *bruchel*, the brisket, or lower part of the throat.

SOCAGE, a free tenement held in fee simple by services of an economic kind, such as the payment of rent or the performance of some agricultural work, was termed in medieval English law a socage tenement. In a borough a similar holding was called a burgage tenement. Medieval law books derived the term from *socus*, ploughshare, and took it to denote primarily agricultural work. This is clearly a misconception. The term is derived from O. Eng. *soc*, which means primarily suit, but can also signify jurisdiction and a franchise district. Historically two principal periods may be distinguished in the evolution of the tenure. At the close of the Anglo-Saxon epoch we find a group of freemen differentiated from the ordinary ceorls because of their greater independence and better personal standing. They are classified as *sokemen* in opposition to the *villani* in Domesday Book, and are chiefly to be found in the Danelaw and in East Anglia. There can hardly be a doubt that previously most of the Saxon ceorls in other parts of England enjoyed a similar condition. In consequence of the Norman Conquest and of the formation of the common law the tenure was developed into the lowest form of freehold. Legal protection in the public courts for the tenure and services deemed certain, appear as its characteristic feature in contrast to villainage. Certainty and legal protection were so essential that even villain holdings were treated as *villain socage* when legal protection was obtainable for it, as was actually the case with the peasants on Ancient demesne who could sue their lords by the little writ of right and the *Monstraverunt*. The Old English origins of the tenure are still apparent even at this time in the shape of some of its incidents, especially in the absence of feudal wardship and marriage. Minors inheriting socage come under the guardianship not of the lord but of the nearest male relative not entitled to succession. An heiress in socage was free to contract marriage without the interference of the lord. Customs of succession were also peculiar in many cases of socage tenure, and the feudal rule of primogeniture was not generally enforced. Commutation, the enfranchisement of copyholds, and the abolition of military tenures in the reign of Charles II. led to a gradual absorption of socage in the general class of freehold tenures.

See Pollock and Maitland, *History of English Law*, i. 271 ff.; F. W. Maitland, *Domesday Book and Beyond*, 66 ff.; P. Vinogradoff, *Villainage in England*, 113 ff., 196 ff.; *English Society in the 11th Century*, 431 ff. (P. Vi.)

SOCIAL CONTRACT, in political philosophy, a term applied to the theory of the origin of society associated chiefly with the names of Hobbes, Locke and Rousseau, though it can be traced back to the Greek Sophists. According to Hobbes (*Leviathan*), men lived originally in a state of nature in which there were no recognized criteria of right and wrong, no distinction of *meum* and *tuum*. Each person took for himself all that he could; man's life was "solitary, poor, nasty, brutish and short." The state of nature was therefore a state of war, which was ended by men agreeing to give their liberty into the hands of a sovereign, who thenceforward was absolute. Locke (*Treatise on Government*) differed from Hobbes in so far as he described the pre-social state as one of freedom, and held that private property must have been recognized, though there was no security. Rousseau (*Contrat social*) held that in the pre-social state man was unwarlike and even timid. Laws resulted from the combination of men who agreed for mutual protection to surrender individual freedom of action. Government must therefore rest on the consent of the governed, the *volonté générale*. Though it is quite obvious that the theory of a social contract (or compact, as it is also called) contains a considerable element of truth—that loose associations for mutual protection preceded any elaborate idea or structure of law, and that government cannot be based exclusively on force—yet it is open to the equally obvious objection that the very idea of contract belongs to a more advanced stage in human development than the hypothesis itself demands. Thus the doctrine, yielding as a definite theory of the origin of society to the evidence of history and anthropology, becomes interesting primarily as revolt against medieval and theocratic theories of the state.

SOCIALISM, a term loosely formed from the Latin adjective *socialis* (*socius*, a comrade), and first used of certain doctrines of Robert Owen (*q.v.*). "Socialist" occurs in a discussion between Robert Owen and the Rev. J. H. Roebuck at Manchester (publ. Heywood, Manchester, 1837), pp. 27, 133. From the context it seems a nickname. But the title "Owenist" was disliked by many supporters (see *Co-operative Magazine*, 1826, p. 28) and "Co-operator" was acquiring a different sense. The new term was used in 1838 in France (by Pierre Leroux), and figures in 1840 in Reybaud's *Socialistes modernes*.

Definition.—Socialism is that policy or theory which aims at securing by the action of the central democratic authority a better distribution, and in due subordination thereunto a better production, of wealth than now prevails.

This definition may not entirely cover the ancient and medieval theories to which the name has been given by modern writers (see also ANARCHISM, COMMUNISM, CO-OPERATION). It hardly covers the schemes of Robert Owen himself. But just as chemistry is not alchemy, or astronomy astrology, modern socialism is not to be identified with Utopian fancies, and need not be so defined as to embrace them. For a like reason it need not be so defined as to include every tenet of leading socialistic writers. We must disentangle their socialism from what is superadded to it and not involved in the socialistic idea.

The word began in the days of Owen; but, as there were utilitarians before Mill made the name current, so there were socialists before Owen. Socialism, as a policy, begins with the beginnings of politics. As a theory, it begins whenever the state is perceived to have a distinct office from other factors in the order of society, and that office is so magnified that the whole or main charge of the economic resources of the people is assigned to the state, whether for production or for distribution. There was anarchism among the Cyrenaics and Cynics. Phaleas of Chalcedon was a communist. There is state socialism in the *Republic* of Plato, and much remains in the Laws. It is true that in those days society and state are not clearly distinguished. When Aristotle tells us that "man is by nature a political animal" (*Politics*, i. 1), the adjective is ambiguous. But the individual and the state are not confused; they are even, by the Cynics, too far separated.

State and individual were also well apart in Rome, under the Roman system of legal rights—public, private, real, and personal. There were socialistic measures in Rome, *panis et circenses*; and there were agrarian, to say nothing of usury laws. But trade and industry were not usually regarded as worthy subjects for the state and the statesman to touch at all. There are instances of municipal socialism in Italy and the provinces under the Roman Empire (S. Dill, *Roman Society from Nero to Marcus Aurelius*, 1905, pp. 218, 220, 222). In the middle ages feudalism was more akin to paternal government than to individualism; but it was, politically, too undemocratic to approach a true socialism. On its decadence something like a *de facto* municipal socialism made its appearance. The gilds of the great cities, *imperium in imperio*, regulated production and incidentally distribution. They did not prevent the existence of millionaires like the Fuggers, but they brought even these rich men under their rules. The equality was greater than the liberty, though neither was complete, to modern notions.

With the breaking up of the gilds came what is commonly called individualism. Thenceforward over against the controlling government of the monarch or the commonwealth was to stand the commercial competition of free individuals. It is one of our modern problems to determine whether this individualism is doomed or not. It has never existed pure and unmixed. Between the time of the gilds and the time of the trade unions lies the time, say in England in the 16th and 17th centuries, when there were enterprising trade and busy industry, with enough of power surviving in the old organizations to prevent absolute anarchy. As invention followed invention in the 18th century, industry changed its form and became great instead of small. That is to say, it tended to become more and more an affair of large capital and large workshops, and, instead of the industrial individualism of small masters and independent "manufacturers," who were still "hand"-workers, there was appearing the industrial collectivism of the factory system, where manufacture was nothing without its machinery, its colossal division of labour and its strict technical discipline and drill. There was a short period in England when employers were allowed to draw advantage from the change without any hindrance from the state. But in no greater time than one generation the regulation of factories began, the period of anarchy ended, and the commercial competition of free individuals began to be surrounded with safeguards, more or less effective.

Modern socialism, as defined above, is (*a*) opposed to the policy of *laissez-faire*, which aims at the least possible interference with industrial competition between private persons or groups of persons, and (*b*) suspicious of a policy of mere regulation, which aims at close surveillance and control of the proceedings of industrial competitors, but would avoid direct initiative in production and direct attempts to level the inequalities of wealth. The leading idea of the socialist is to convert into general benefit what is now the gain of a few. He shares this idea with the anarchist, the positivist, the co-operator and other reformers; but, unlike them, to secure his end he would employ the compulsory powers of the sovereign state, or the powers of the municipality delegated by the sovereign. In the former case we have state socialism, in the latter municipal. Where there is direction or diversion of industry by the public force mainly for the benefit of a few, this is hardly socialism. It employs the same machinery, the public force; and it secures a revenue which may possibly be used for the general benefit, as in the case of protective duties. But in such cases the general benefit is only a possible incident. So far (for example) as protection succeeds in keeping out the foreign competitors, the main result is the assured gain or prevented loss of a few among the citizens. Socialism by intention and definition would secure benefits not for a few, a minority, or even a majority, but for all citizens. Communism has the same end in view; and socialism and communism (*q.v.*) are often confused in popular thought. But the communist need not be a socialist; he may be an anarchist, an opponent of all government; while the socialist need not be a communist. The socialists of the 20th century rarely, if ever, demand that all wealth be held *in common*, but only that the land, and the large workshops, and the materials and means of production on a large scale shall be owned *by the state*, or its delegate the municipality. The despotism of gilds would not now be tolerated. The strictest public regulation of trade and industry will probably continue to be that of the state, rather than of the municipality, for local rules can be evaded by migration, the state's only by emigration. But the smaller bodies are likely to display more adventurous initiative; and it is significant that they appear in the imagination nearer to the individual than the state even of a small people can ever appear to its own citizens. Yet it is not the smallest unit, the parish, that has shown most activity in England, but the county, a unit arithmetically nearer to the state than to the individual.

It might be plausibly argued that the movement of modern events has been rather towards a kind of anarchism (*q.v.*) than a kind of socialism, if it were not for the element of compulsion (quite contrary to anarchism). Even the English poor law, universally called socialistic, is administered locally and the degree of socialism varies with the parishes. When the state's regulation went further and further in a succession of Irish Land Acts (1870, 1881, 1903), it assumed a socialistic character; the face of agricultural industry was transformed for the benefit of the majority, if hardly of the whole, by the action of the state. But the result has been a state-aided individualism. The attempt to transform all industries by protection has not been made by the English state in these days. It remains broadly true that, since the English state became more democratic (Reform Acts of 1832, 1867, 1884), its socialism has become more and more of the municipal character. The end in view having more to do with economics than with politics, it mattered little theoretically whether the power exercised was that of the central authority acting directly or the delegated power in the hands of the smaller public bodies.

This has been the course of events in England with little conscious theory or principle on the part of the people or even of its leaders. It is certainly a partial fulfilment of the aspirations of those whose theory or principle is socialism. The most important form of modern socialism, which may be called for convenience "social democratic" socialism, is founded on economic theory more or less clearly understood; it is therefore often described as economic or scientific socialism. Many men have become socialists less from logic than from sympathy with suffering. But modern socialism without disowning sentiment knows the need of facts and sound reasoning better than its predecessors, whom it calls Utopian. While among civilized peoples the suffering has on the whole grown less, the influence of socialism has grown greater; and this is largely owing to the efforts made by the best socialists to reason faithfully and collect facts honestly. The remarkable extension of socialism in Germany may be traced in great part to the special circumstances which have made social democracy the chief effective organizer of working men in that country. But modern socialism is not a purely German product. To scientific socialism England, France and Germany have all made contribution.

Its theoretical basis came, in two curiously different ways, from practical England. The idea that the underpaid labour of the poor is the main source of the wealth of the rich is to be found not only in Godwin and Owen but in the minor English land-reformers and revolutionary writers of the 18th and early 19th centuries, such as T. Spence, W. Ogilvie, T. Hodgskin, S. Read, W. Thompson. The positions of Ricardo that value is due to labour and that profits vary inversely as wages were taken by Marx (without Ricardo's modifications) as established doctrines of orthodox political economy. It was declared to be a scientific truth that under modern industrial conditions the "exploitation" of the labourer is inevitable. In the theory of rent the exploitation of the tenant by the landlord was already admitted by most economists. It was for the socialists to show that the salvation both of tenant and labourer lay in the hands of the central authority, acting as the socialists would have it act.

France had been prepared for socialism by St Simon and Fourier. The revolutions of 1830 and 1848, though on the whole unsuccessful in directly organizing labour, made socialistic ideas circulate widely in Europe. Men began to conceive of a political revolution which should be also a social revolution, or of a social and industrial revolution which should be also political. We may say broadly that the socialism of 1910 was either inspired by the ideas of that time or is coloured by them. Modern scientific socialism was thus about fifty years old towards the end of the first decade of the 20th century. It would have little claim to be scientific if it had undergone no change in that time; but the change was not greater than the change in orthodox economic doctrine, which indeed it had followed.

Its adherents may be classified (1) according to theory and (2) according to policy, though, as scientific socialism is really both theory and policy, being a political claim founded on an economic argument, the distinction is sometimes a matter of emphasis.

There are theorists who find the exploitation of the tenant by the landlord to be the main evil whether it involves the degradation of the labourer or not. As some theologians confine their criticism to the Old Testament, so Henry George and Professor A. Loria, shunning the name of socialist, would not directly attack the system of modern large capitals but the appropriation of land. The social-democrat attacks both. He either takes Marx as guide, or, allowing Marx to be vulnerable, he stands on received economic doctrines with the addition of a political theory. He may himself rest content with the nationalizing of the means of production or he may tend towards communism.

In policy there is a difference between those scientific socialists who admit of no compromise with the existing order and the other scientific socialists who are willing to work with the existing order. The straitest sect would keep quite aloof from ordinary politics. The first step towards compromise is to allow the formation of a socialistic party in the legislature, bearing a protest against all other existing parties. This is the rule on the continent of Europe. The next step is to allow members of the party to be also members of other existing political parties; this is common in England and her colonies. The political history of scientific socialism is to a large extent the history of its attempts to avoid, to effect and to utilize the compromise.

There is, of course, a large body of socialists outside any organization. Partly from the teachings of socialists and partly from literary descriptions of the aims and reasons of socialism, there are multitudes who think socialistically without defining their own position with the exactness of the scientific socialist. It is often these amateurs who fall readily into Utopias and who confound the boundaries between socialism and communism. This is done for example by such writers as H. G. Wells and Upton Sinclair. The temptation is evident. The borderland between large production and small may be sometimes debateable; and, as soon as the socialistic nationalizing of large production is extended to small, the way is open to the Utopias of communism. Communism is an idea far more utopian than socialism. Like the idea of a kingdom of heaven or a millennium, it springs often from a spiritual enthusiasm that feels sure of its end and, at first at least, recks little of the means.

The enthusiasm may spring from a real conversion of the sort described in the *Republic* of Plato (vii. 516). Even scientific socialism, depending theoretically on close adherence to economic principles, depends practically on this conversion. It is as with Christianity, which depends on its theology but also on its change of heart; till we have refuted both we have not refuted Christianity. So a change of heart, which is also a change of view, is to socialism, as a religion, what economic and political theory is to it as a creed. All that is best in anarchism shares this spiritual feature with socialism. It is of a higher type than the human sympathy which went with utopian socialism; it includes that sympathy and more. It requires a mental somersault of the kind taken by Hegel's metaphysician and (analogically) by Dante at the earth's centre. The observer begins to see the world of men all over again, throwing from him all the prejudice of his class and abstracting from all classes. This abstraction may be less hard for those who belong to a class that has little, than for those of a class that has much, as religious conversion is held to be easier for the poor. But it is not really easy for any. The observer tries to conceive what is at bottom the difference between rich and poor. Casuists can show that the line is a vanishing one, and that there are large groups of cases where the distinction is unsubstantial. Such borderlands are still the sporting ground of economists and philosophers and biologists. We could hardly contend, however, that no distinctions are true which break down at the border. It seems unsafe to say there is no war of classes, because at their nearest extremities the classes pass into each other. At the utmost we might infer that the best way to bring the war to an end was to crowd the nearest extremities. At present, taking the contrast not at its least or greatest but at its mean, we find it no fancy. The features that make the lower as distinguished from the higher are of different quality and kind, not merely of amount. They are described perhaps most fully by Tolstoy in *Que faire?*, but they are brought to the ken of every one of the rich who can overhear the daily talk of the poor, enter into their daily cares and put himself in their place. If he makes the somersault and is "converted," all the little and great privileges of the rich seem now to have as many presumptions against them as were before in their favour. Why should he have so much comfort and they so little? why should he be secure when they live from hand to mouth? why should art and science and refinement be thrown in his own way and be hardly within their reach at all? Such and similar ponderings are not far from a revolt against inequality, whether the revolt takes the shape of anarchism or of socialism. It carries us beyond the paternal socialism of Carlyle and Ruskin or even of the author of *Sybil*, relying as Disraeli did on the "proud control" of the old English state, which was occasionally and spasmodically constructive as well as controlling, but was always actuated by a feeling like that of a chief to his clansmen. The exponents of paternal socialism have no clear consciousness of the change in the state itself. They think they can still use the old tools. They see that the people have changed, but they do not see that if the past cannot be revived for a people neither can it be revived for a state. The idea of lordship (as distinguished from leadership) is becoming intolerable; and this restiveness may contain a safeguard against one of the worst risks of socialism, bureaucracy. Before the governing bureaucracy had destroyed all originality and eccentricity, the sovereign people would have discovered for itself that "tyranny is a poor provider."

Great Britain.—In England a certain academic interest in socialism was created by Mill's discussions on the subject in his *Political Economy* (1848) and a more practical interest by the appearance of the Christian Socialists. "The red fool-fury of the Seine" caused prejudice even against such harmless enthusiasts. The People's Charter (in the 'thirties) had no socialistic element in it. Socialism first showed signs of becoming a popular movement in England after the lecturing tour of Henry George (1881–1882) in advocacy of the nationalizing of the land. About that very time (1880) the Democratic (afterwards in 1883 the Social Democratic) Federation was formed by advocates of the whole socialistic programme. A secession took place in 1884 when William Morris, H. M. Hyndman and Belfort Bax founded the Socialist League. William Morris parted company with the league in 1890, and seems to have become more anarchist than socialist. Edward Bellamy's *Looking Backward* (1887) made some impression among intellectual people in England; but Robert Blatchford's *Merrie England* (1894) made much more way amongst the multitude, followed up as it was by his newspaper the *Clarion*. There were still few signs of a strong party. The first members of the Fabian Society (1888) were by definition opportunists, and though the *Fabian Essays* (1889) were socialistic they were the declarations of men willing to use the ordinary political machinery and accept reforms in the present that might point to a socialistic solution in the very far distance. Most of the Fabians became hard-working radicals of the old type, with general approval. England does not love even the appearance of a revolution. Nevertheless a change has come over the spirit of English politics in the direction desired by socialists, though hardly through any efforts of theirs. The change was predicted by Herbert Spencer in 1860 (*Westm. Rev.* April) some years before household suffrage (1867). In *The Man versus the State* (1885) he demonstrates that liberal legislation which once meant the removal of obstacles now meant the coercion of the individual. Though a large part of the coercive measures enumerated by Spencer are rather regulation than socialism, undoubtedly there is here and there a socialistic provision. Thomas Hill Green's dictum, "It is the business of the State to maintain the conditions without which a free exercise of the human faculties is impossible" (*Liberal Legislation and Freedom of Contract*, 1881), did not in appearance go much further than Herbert Spencer's that "it is a vital requirement for society and for the individual to recognize and enforce the conditions to a normal social life" (*The Man versus the State*, p. 102); but the former saw clearly that the policy of the future must go beyond mere regulation. Too much importance has been attached to a saying of Sir William Harcourt in 1888, "We are all Socialists now." He meant no more than that we are all social reformers who will use the aid of the state without scruple if it seems necessary. He did not mean that the English people had adopted a general principle of socialism. Except in the case of free trade, it is hard to discover a general principle in English politics. The English people judge each case on the merits, and as if no general principle ever affected the merits. Regulation and not initiative is the prevailing feature of the action of government even now. The railways are still in private hands. The state railways, canals and forests of India, though John Morley (afterwards Viscount Morley) "made a present of them to the Socialists" (House of Commons, 20th July 1906), are the public works of a modern benevolent despotism, and do not go very far beyond those of its ancient prototype. They are the works not of the Indian but of an alien democracy. Contrariwise, in England itself, possessed of a fair measure of self-government, crown lands, government dockyards, army, fleet, post office were in existence when there was no thought of state socialism; they are not modern innovations but time-honoured institutions.

The same is true of a great part of municipal socialism. It existed in the middle of the 19th century, and no local community would have been deterred from having its own water-supply or gas works by any fear of socialism. The fear is still less deterrent now; and we have seen electric lighting, tramways, parks, markets, ferries, light railways, baths and wash-houses, house property, river steamers, libraries, docks, oyster beds, held by towns like Glasgow, Birmingham, Manchester, Liverpool, Leeds, Bradford, Huddersfield, Colchester. Sometimes the management is economical, sometimes wasteful; but in all cases the undertakings have been supported by a majority who care little for general theory and everything for local interests. The "unity of administration" successfully advocated by Edwin Chadwick in the later Victorian period, and requiring "competition for the field but not in the field," is not inconsistent with municipal socialism. This last has been provided with new machinery by the establishment of county and district councils (1888), parish councils (1894) and even the perhaps-otherwise-intended metropolitan borough councils (1899). Till 1907, when the progressive party in the London County Council were heavily defeated, that council was certainly moving in the path of municipal socialism. But, in its achievements as distinguished from its claims, it had not overtaken, still less surpassed, Birmingham or Glasgow. Municipal socialism in Britain finds many critics; it has the drawbacks of all democratic self-government. It is sometimes wasteful; but it is seldom corrupt; and there is no general desire for a return to a less adventurous policy. In the country districts democracy is still imperfectly conscious of its own power. There are acts on the statute book that would well equip a parochial socialism; but socialists seem to be able to do little more than accelerate slightly what seems to be the inevitably slow pace of political reform in England. Whether the extension of the franchise to women will quicken the rate of reform is uncertain.

With every allowance, the change in English politics has been real, and it has been due in a great measure to the growth of organization among working men. The old trade unionism passed out of its dark ages by the aid of legislation (in 1871), which was for thirty years (till the Taff Vale decision in 1901, the older view being restored by the Trades Disputes Act 1906) considered to give to the trade unions the advantages of a corporation without the drawbacks. At the same time, through a better law of small partnerships (Industrial and Provident Societies Acts 1852, 1862, 1876), the co-operative societies were making rapid progress. Compulsory education (1870) increased the intelligence of the labouring classes and therewith their power to use their opportunities. Labour legislation, removing truck, making inspection and regulation of factories more stringent (see the consolidating Act of 1878 and the Factory and Workshop Act 1901) and providing compensation for accidents (1906), was forwarded by both political parties. This was not socialism but regulation. The old unionists were radicals of the old type. Not so the unionists who came first into prominence with the Dock Strike in London in 1889. The way had been prepared by demonstrations of the unemployed in 1887 and 1888. When unionism embraced unskilled labourers, and at the same time pressed on the federation of all trades societies and their joint action, when, too, in the trade union congresses the intervention of the state was repeatedly claimed as essential to the success not only of an eight hours' day but of such socialistic measures as nationalization of the land, it was manifest that there was a new leaven working. The larger the numbers included in the trades societies the more their organization was bound to depart from that of the mass meeting, and to become indirect instead of direct self-government, government by representatives, and more and more by specially trained representatives. This was a tendency towards bureaucracy, or government by officials, not the highest type of popular government. A better preparation for democratic government has been given by the co-operative societies. If it be true that under a coming socialism the working class must dominate, then every phase of organization must be welcomed which widens their experience of self-government, more especially in the handling of industrial and commercial affairs. This last kind of education has been well given by co-operation, though chiefly through capital and hired labour on the old pattern of the ordinary employers. Co-partnership societies, best exemplified in the midland districts of England, are more democratic; but their numbers are few. The claims of the workman are somewhat in advance of his education. On the other hand it seems impossible in England to secure moderate concessions without extravagant claims.

Germany.—In Germany it was long an axiom that socialists must leave ordinary politics and political machinery severely alone as an evil thing. The short and futile struggle for constitutional liberty in 1848–1849 had driven most of those who were "thinking socialistically" into abandonment of political reform and into plans of fundamental change amounting to revolution. Karl Marlo (1810–1865) and K. J. Rodbertus (*q.v.*) contented themselves with laborious and profound studies not intended to bear immediate fruit in practice. Marx and Lassalle were not so pacific. The former was from the first (see his Manifesto of 1847) inclined to give socialism an international character, taking also no pains to distinguish it from communism. Lassalle desired it for his own nation first. Both of them were in a sense Hegelians. From Hegel they had learned that the world of men, like the world of things, was in constant process of development; but unlike Hegel they regarded human evolution as purely materialistic, effected always by a struggle between classes in society for the outward means of well-being. Feudalism, itself the result of such a struggle, had given place to the rule of the middle classes. The struggle to-day is between the middle classes and the working classes. At present those who do not possess capital are obliged to work for such wages as will keep them alive, and the gains from inventions and economics are secured by the employers and capitalists. The labourer works at his cost price, which is "the socially necessary wages of subsistence" (the bare necessaries of a civilized life); but he produces much more than his cost, and the surplus due to his "unpaid labour" goes to the employer and capitalist. This is what Lassalle called the "brazen law of wages," founded on Ricardo's supposed doctrine that (*a*) the value of an article that is not a monopoly is determined by its cost in labour, and (*b*) the wages of labour tend to be simply the necessaries of life. The tendency of the labouring population to increase beyond the means of steady employment is a frequent benefit to the capitalists in the periodic expansions of investment and enterprise, arising in response to new inventions and discoveries. Large business in modern economy swallows up small. Not only the independent artisans and workers in domestic industries, but the small capitalists and employers who cannot afford to introduce the economies and sell at the low prices of their large rivals are disappearing. But the growth of the proletariat, together with the concentration of business into fewer hands and larger companies, will cause the downfall of the present system of industry. The proletariat will realize its own strength; and the means and materials of production will be concentrated finally into the hands of the commonwealth for the good of all. This revolution, like that which overturned feudalism, is simply the next stage of an evolution happening without human will, fatally and necessarily, by virtue of the conditions under which wealth is produced and shared in our times.

Such was in substance the view of all the German socialists of the last half of the 19th century. Even Rodbertus had advanced a claim of right on behalf of working men to the full produce of their labour, but thought the times not ripe for socialism. The others made no such reservations. Lassalle planned a centralized organization of workmen led by a dictator, and called on the government of Prussia to establish from the public funds co-operative associations such as his opponent Schulze-Delitzsch had hoped to plant by self help. His socialism was rather national than universal. Marx looked beyond his own nation. He founded the International Union of Working Men in 1864, the year of Lassalle's tragic death. Before the common danger of police prosecutions and persecution the followers of Lassalle and Marx were united at the congress of Gotha in 1875. The name social democrats had crept into use about 1869 when the followers of Marx founded at a congress in Eisenach the social democratic working men's party. The party began to be a power at the congress of Gotha. It is a power now, but its doctrines and policy have undergone some change.

The last quarter of the 19th century witnessed (1) the repressive laws of 1878, (2) their repeal in 1890, (3) the three Insurance Laws and (4) a quickened progress of German industry and wealth during thirty years of peace and consolidation.

Bismarck's government, alarmed by attempts on the life of the emperor and by the increased number of votes given to socialistic candidates for the reichstag, procured the passing of the Exceptional Powers Act (*Ausnahme Gesetz*) in 1878. The legislation at this time resembled the Six Acts of 1819 in England. Combined action and open utterance in Germany became almost impossible; and for organs of the press the social democrats had recourse to Zürich. Liebknecht and Bebel could still raise their voices for them in parliament, for Bismarck failed in his attempt to deprive members of their immunities (March 1879). But the agitation as a whole was driven underground; and it speaks well for the patience and self-control of the people that no widespread excesses followed. The declaration of the Social Democratic congress at Wyden, Switzerland, in 1880, that their aims should be furthered "by every means" instead of the old phrase "by every lawful means," was a natural rejoinder to the law that deprived them of the lawful means; and it seems to have had no evil consequences. In 1881 repression was so far relaxed that trade unions were allowed to recover legal standing. In 1890 the reichstag refused to renew the law of 1878 for a fifth period; and finally in 1899 it repealed the law forbidding the amalgamation of workmen's unions, and specially aimed at the new socialistic unions, the natural allies of the social democrats. The vexatious prosecutions and condemnations for Majestätsbeleidigung (*lèse majesté*) following 1890 did the cause more good than harm. The socialistic voters increased from 437,438 in 1878 to 1,800,000 in 1894 and 2,120,000 in 1898, while the elected members increased from 12 in 1877 to 46 in 1894 and 56 in 1898. By 1903 the voters had increased to three millions and in the elections of February 1907 they were 3,240,000. The socialists, however, in 1907 found themselves represented by 43 members as against 79 in 1903. The reduced representation was due to a combination of the other parties against them, the matters at issue not being industrial policy, but colonial government and naval expenditure. The increase in the number of voters remains a proof that the power of the party in Germany has rather increased than diminished. In 1908 they gained seven seats in the Prussian Diet, where they had hitherto been unrepresented. Yet "remedial measures" had been passed which were intended to make socialism unnecessary. Bismarck, who admired Lassalle and had no scruples about the intervention of the state, had planned a series of measures for the insurance of workmen against sickness, accidents and old age, measures duly carried out in 1883, 1884 and 1891, respectively. The socialists not unreasonably regarded the government as their convert. They could point to two other "unwilling witnesses," the Christian Socialists and the "Socialists of the Chair."

In the Protestant parts of Germany the socialists as a rule were social democrats, in the Catholic as a rule they were Christian Socialists. As early as 1863 and 1864 Dr Döllinger and Bishop Ketteler, followed by Canon Moufang, had represented socialistic sentiment and doctrine. Ketteler, who had been under the influence of Lassalle, had hopes that the church would make productive associations her special care. Moufang would have depended more on the state than on the church. All were awake to the evils of the workmen's position as described by the social democrats, and they were anxious that the Catholic church should not leave the cure of the evils to be effected without her assistance. Ketteler died in 1877; and the pope's encyclical of the 28th of December 1878 bore no trace of his influence, mixing up as it did socialists, nihilists and communists in one common condemnation. The encyclical *De conditione opificum* of 1891 might show that the views of the Christian Socialists had penetrated to headquarters; but the encyclical on Christian Democracy of 1901 (January) betrays no sympathy with them. The Protestant church in Germany has been hampered by fear of offending the government; but it contains a vigorous if tiny body of Christian Socialists. Rudolf Todt, a country pastor, was their prophet. His book on *Radical German Socialism and Christian Society* (1878) led Dr Stöcker, the court chaplain, to found an association for "Social Reform on Christian Principles." This was denounced rather unfairly by politicians of all ranks as an organized hypocrisy. Its influence was shortlived, and its successor, the "Social Monarchical Union" (1890), shared the unpopularity of Stöcker, its founder. Even the Socialists of the Chair, middle class Protestants as they were, would have nothing to say to it, but preferred to go a way of their own.

From the year 1858 there had existed a league of economists and statesmen called the "economic congress" (*Volkswirtschaftlicher Kongress*), a kind of English Cobden Club, though it aimed chiefly at free trade among all sections of the German people in particular. After the Empire its work seemed finished; and a new society was formed, the "Union for a Policy of Social Reform" (*Verein für Socialpolitik*). Professors G. Schmoller, W. Roscher, B. Hildebrand, A. Wagner, L. J. Brentano, the statistician E. Engel and others met at Halle in June 1872, and a meeting of their supporters followed at Eisenach in October of that year. These *Katheder-Socialisten* or Socialists of the Chair (academic socialists) agreed with the social democrats in recognizing the existence of a "social question," the problem how to make the labourers' condition better. To the old-fashioned economist this was no problem for the legislature; competition solved its own problems. But, while the social democrats looked for social revolution, the academic socialists were content to work for social reform, to be furthered by the state. The state was, to them, "a great moral institution for the education of the race." They were a company of moderate state socialists, relying on the state and the state as it then was. They did much gratuitous service to the government in the preliminary investigations preceding the great insurance laws.

The German people were made a little more inclined to state socialism than before by the efficiency displayed by the bureaucracy in the wars of 1866 and 1870. If the Insurance Laws are found to work well, this inclination may be confirmed, and the idea of a revolution may fall into the background. The attitude of the social democratic party became less uncompromising than in earlier days. Since they regained their liberty in 1890, their leaders have kept them well in hand. Their principal journal *Vorwärts* was conducted with great ability. Their agitation became as peaceful as that of trade unionists or co-operators in England. They ceased to denounce the churches. They tried to gain sympathy, quite fairly, by taking up the cause of any distressed workers, or even ill-used natives in colonies, and urging redress from the state. The present state had become to them almost unconsciously their own state, a means of removing evils and not a mere evil to be removed. The anarchists had been disowned as early as 1880. The extreme socialists who demanded return to the old tactics were cast out at Erfurt in 1891, and became "Independent Socialists."

The controversy between friends and critics of socialism still rages in learned circles, producing a prodigious quantity of literature year by year; but the old strictures of Treitschke and Schäffle seem now to have lost a little of their point. Though the programme adopted at Gotha in 1875 was not entirely or even seriously altered, the parts of it due to Lassalle fell into the background. For many years Marx and not Lassalle was the great authority of the party. Marx died in 1883, but remained an oracle till 1894, when (just before his own death in 1895) Engels published the last volume of his friend's book on capital. The volume was expected to solve certain logical difficulties in the system. Instead of this, it caused a feeling of disappointment, even among true believers. Many, like Bebel and Kautsky, kept up the old adoration of Marx; but many, like Eduard Bernstein, rightly felt that to give up Marx is not to give up socialism, any more than to give up Genesis is to give up theology. Bernstein openly proposed in congress that the old doctrines and policy of the party, involving as they do the despair of reform and insistence on the need of revolution, should be dropped. He had not carried his point in 1908, but his influence seemed to be increasing. The death of Liebknecht (August 1900) removed from the ranks of the social democrats one of their most heroic figures, but also one of the strongest opponents of such a change of front. Yet Liebknecht himself had made concessions. It was impossible for a man of his shrewdness to close his eyes to what the state had done for the German workman. It was impossible, too, to ignore the progress that Germany had made in wealth and industry since the creation of the Empire in 1871. Germany has been fast becoming a manufacturing country; and, though the growth of large manufacturing towns in the Rhine valley and elsewhere has multiplied socialists, it has added to the income of the German workman. He is further from poverty and distress; and his socialism means an endeavour after a larger life, not, as formerly, a mere struggle against starvation. It is likely, therefore, to have less and less of mere blindness and violence in it.

The German socialists were chiefly interested in securing such an extension of the franchise in Prussia as would make their representation in the Prussian parliament correspond as near to the number of their adherents as in the Reichstag itself. They had only gained seven seats in the former in June 1908, though they had perhaps half a million of adherents in Prussia. They seemed for good or for evil to be taking the place of the old radical party. The position in Austria was somewhat different. The first general elections held under a really democratic suffrage (May 1907) resulted in the return of eighty social democrats and sixty Christian socialists to the Reichsrath, as compared with eleven and twenty-six in the unreformed parliament. They were opposed (as anti-clerical and clerical) on many questions, but they made it certain that economic and industrial policy affecting the whole nation would rival and perhaps out-rival the questions of racial supremacy and *haute politique* that absorbed the attention of the old Reichsrath.

France.—In France the socialists have found it harder to work in the parliamentary harness. Marx had said long ago that for the success of socialism besides English help there must be "the crowing of the Gallic cock." French enthusiasm for social revolution is feeble in the country districts but very strongly pronounced in the large towns. The *Communards* of 1871 might be called municipal socialists of a sort, but their light went out in that *année terrible*. Something like a movement towards organized socialism began in 1880 on the return of some prominent members of the old commune from exile. A congress was held at Havre under the leadership of J. Guesde and J. A. Ferroul; it adopted a "*Collectivist*" programme, *Collectivisme* meaning state socialism. A minority under J. F. E. Brousse and J. F. A.

Joffrin broke away (in 1881) from the main body and stood out for municipal socialism, decentralization and, later (1887), self-governing workshops aided by public money. Co-operative workshops are already subsidized in France from the public funds, and favoured by preferences in public works and other privileges, without striking results. The *Broussistes* are also called *Possibilistes*, as content with such socialism as is immediately practicable. They supported, for example, agrarian reform on the present basis of private property (Marseilles, 1892). After several unsuccessful negotiations, the amalgamation of the Collectivists, Possibilists and *Blanquistes* (extreme revolutionaries)) was accomplished in 1899. But the body had not the cohesion of the German party. Though the socialists in the Chamber acted more or less loyally together, they were not closely controlled by the organization outside. In consequence (like Mr John Burns in England in 1905–1906) those who accepted office usually came under a cloud. This happened to M. Millerand when he became minister of commerce in the Waldeck Rousseau government of 1899, and in a less degree to M. Jaurès when he became vice-president of the Chamber. M. Millerand was, indeed, expelled from the party, and at the socialist congress of Amsterdam (August 1904) a strongly worded resolution condemned any participation by socialists in *bourgeois* (middle-class) government. The vote was not unanimous, and the resolution itself was attributed to the German Bebel. An attempt was made in Paris (April 1905) to bind the various parties of French socialists more closely together by forming a new "Socialist party, the French Section of the International Labour Union." It laid down stringent rules for the guidance of socialist deputies. In comparison with the steady united action of the Germans, the proceedings of the French socialists, perhaps from their greater political liberty, seems a wayward guerilla warfare. The French state is not on principle averse from intervention. It has been always more ready than in England to interfere with competitive trade and to take the initiative on itself. It controls the Bank of France, owns most of the railways, and directs secondary as well as primary education. After the disputes at Carmaux (in 1892) it proposed to take over the mines. There is no general poor law; but old-age pensions have been voted, and workmen's compensation is as old as 1888. State socialism might have gone farther if French bureaucracy had not proved less efficient than German.

Though there are socialistic French professors there can hardly be said to be a body of academic socialists in France. The strongest economic writing is still that of the orthodox economists, P. E. Levasseur, P. P. Leroy-Beaulieu, Yves Guyot. Even Professor Charles Gide, though reformer, is not socialist. Of the two party periodicals *La Revue socialiste* is moderate, *Le Mouvement socialiste* hardly so. The latter is in many ways more akin to anarchism than state socialism. Socialism has its allies in the sporadic Christian socialism of the Churches, both Catholic and Protestant, and in the solidarists who would transform the existing system of employment without abolishing private property. The school of Le Play, though devoted to social reform, can hardly be called an ally of socialism.

Netherlands.—Socialism has found a kindlier soil in Belgium and Holland, and these countries have been the favourite meeting-place in recent years of congresses of all denominations of socialists. In Belgium the Flemish social democratic party led by de Paepe united in 1879 with the Brabantine or Walloon. They organized trade unions. They helped the liberals in 1893 to procure the extension of the suffrage. In 1907 they had thirty representatives in parliament. The flourishing co-operative societies, *Vooruit* (Forwards) in Ghent and *Maison du people* of the Brussels bakers, were the work of their members. Its success in co-operation is almost the distinctive feature of Belgian socialism. Socialists helped to procure the adoption by Belgium of a system of old-age pensions for the poor in 1900, and of the cheap trains which do so much for the workmen in town and country. In Holland, which is not a crowded manufacturing country but even now largely agricultural and pastoral, the socialists are less formidable, if that be the right word. They came into line with the German socialists in 1889. Social reform proceeds with or without their aid. There has been a factory act since 1889 and an act for workmen's insurance against accidents since 1900. Municipal socialism has made progress. The great railway strike of 1903 aroused public interest in the condition of the workman, but the legislation that followed was rather regulative than socialistic.

Switzerland.—Switzerland, for generations a refuge to exiles, shows them hospitality without sharing their views. There is little legislation of a socialistic nature; socialists are to be found here and there, especially in the German cantons.

Scandinavia.—Scandinavia stands less apart from European movements than formerly, but industrial legislation is rather regulative than socialistic. Hjalmar Branting, one of the most prominent socialists, was in 1908 a member of the Swedish parliament. The trade unions of Denmark are largely socialistic, but Denmark is no nearer complete conversion than England.

Italy, Spain.—Socialism might be thought to find a better soil in Italy and Spain. Italy has been described as "all proletariat." But a great depth of poverty fits a people rather for the anarchism of violence than for socialism. The social democrats have made way, notwithstanding, and in 1895 returned fifteen members to parliament. Milan is still the capital of the movement. Laveleye had the idea that revolution was hopeless in Italy because Rome was uninhabitable every summer. But social democracy in Germany, its own country, is not bound up with Berlin. Italy as a whole must make progress in social and political development before it can receive the new ideas and still more before it can grow beyond them. The burden of taxes leads to revolts of sheer despair, followed by repression which has extended to socialistic clubs (*fasci dei lavoratori*) and even workmen's unions. State socialism in the form of state railways has not been very efficient. Factory legislation is behind that of other civilized countries, and is of very recent origin (1902). Old-age pensions were introduced in 1898, and accidents insurance on the German model in the same year. Municipal socialism, finding some trammels removed, had in the first decade of the 20th century begun to show itself in the large towns. In Spain there is a Socialist Federation; there are socialist newspapers; and there seems to be no doubt that the cause has gained ground, even as against anarchism. It may perhaps yet be a power in the legislature. It is mainly in Russia that anarchism has the field to itself.

Russia.—In spite of the hopes excited by the Duma, reformers in Russia have been strongly tempted to be anarchists, even of a violent type. Democracy had special difficulties in reaching legislative power. Partly for this reason, "social democracy" has had a subordinate place. The Russian socialists have, some of them, rebelled against the view once essential to socialistic orthodoxy: that Russia must pass through the stage of "capitalism" before reaching the stage of "collectivism." Marx himself (in 1877) conceded that the progress might be direct from the system of village communities to the ideal of social democracy. Capitalism is already extending itself, and the consistency of the theory need not have been broken. Even so, in the absence of democratic government, the prospects of socialism are doubtful. In Finland there were in 1908 eighty socialist members in a parliament of two hundred. The party might console itself by the thought that over the whole Russian empire many more were socialists than could declare themselves so.

Australia.—In contrast to nearly all the countries of "Old Europe," the self-governing colonies of Greater Britain stand out as nothing if not democratic. Nowhere is democracy sturdier than in Australia, the separate states of which have since 1900 been federated as one commonwealth. But while it has a protective tariff and makes no pretence of a *laissez-faire* policy, the central government is less socialistic than the separate confederated states. The progress even of these has been, as in England, rather in municipal than in state socialism. It is true that crown lands, mines and railways figure more largely. But to find state socialism in its vigour we must pass to New Zealand.

New Zealand.—Removed 1200 m. from Australia, its nearest civilized neighbour, secured by English naval power and "compassed by the inviolate sea," New Zealand is better suited for the experiment of a closed socialistic state than perhaps any other country in the known world. It began its new career in 1880–1890, too late for perfect success but not too late to secure a large measure of public ownership of what elsewhere becomes private property. It owns not only the railways but two-thirds of the whole land, letting it on long leases. It sets a limit to large estates. It levies a progressive income tax and land tax. It has a labour department, strict factory acts and a law of compulsory arbitration in labour disputes (1895). There are old-age pensions (1898), government insurance of life (1871) and against fire (1905). Women have the suffrage, and partly in consequence the restriction of the liquor traffic is severe. There is a protective tariff, and oriental labour is excluded. The success of the experiment is not yet beyond doubt; compulsory arbitration, for example, did not work with perfect smoothness, and was amended in 1908. But there has been no disaster. The decline of the birth-rate has been greater than in Britain. It is fair to add that the experiment is probably on too small a scale to show what might happen in larger countries. New Zealand has only 100,000 sq. m. of territory and about one million of inhabitants, mainly rural and of picked quality. The conditions of combined isolation and security are not easily obtained elsewhere. The action of the state has been in the great majority of instances rather regulative than constructive.

Canada.—This last feature is still more marked on the great North American continent. The Dominion of Canada, from its foundation by confederation in 1867, has given its land away too freely. The Dominion, indeed, has only had the land of new territories to dispose of; the original states are the owners of their own unsettled lands. The Dominion government owns the Intercolonial railway but contents itself with subsidies to the rest, over which it has a very imperfect control (by its Railway Commission). It levies royalties on Yukon gold, carries out public works, especially affecting the means of transport between province and province; and in theory whatever functions are not specially reserved to the provinces fall to the Dominion government. The provincial governments, however, show the greater activity. Ontario owns mines and railroads, Nova Scotia coal and iron fields. "The operation of public utilities" by the municipalities is encouraged. Over Canada with the rise of large towns there has been an advance of municipal socialism, not only in the largest, like Toronto, but in the newer and smaller, such as Port Arthur on Lake Superior, where half the local expenditure is paid by public works. Municipal socialism is still in advance of state socialism. Yet the Dominion has a democratic franchise, paid members, a labour department and free education. The democratic basis is not lacking; but the nature of the country is not such as to make it likely that Canada will lead the way in socialistic experiments. The protective tariff, by developing groups of manufacturing industries before their time, introduced into Canada some of the troublesome features of urban civilization in older countries. Accordingly trade unions became better organized. Trusts (like that of the grocers, 1908) began to show themselves. But socialistic propaganda was mainly confined to the mining districts, especially in the far west.

United States.—The great American republic would seem a better field for socialistic experiment, having more men, more states and ample political liberty. But state socialism, in the strict sense of the action of the central supreme authority, is limited by the Federal constitution, and any functions unassigned to the central authority by the constitution fall to the separate states. The separate states have rarely gone farther in a socialistic direction than England itself. In the way of restriction and regulation they have often done more (see Bryce, *Amer. Commonwealth*, part. v., chap. 95). From 1876 the separate states have had an admitted right to control undertakings having the nature of monopolies. The railways are in private hands; and it was not until 1887 by the Interstate and Commerce Act (followed in 1888 by the Railway and Canals Act) that the Federal power secured control over the means of transport running beyond one state into another. In the same way the Anti-Trust Law of 1890 gave control over the great combinations for "forestalling and engrossing" the supply of articles of necessity or wide use. Socialists have regarded trusts as the stepping-stones to state socialism; but the American people would seem to prefer to see government controlling the trusts rather than itself displacing them.

Trade unionism has made better progress under the Federation of Labor than in the more ambitious Knights of Labor (1878). Like their English counterparts, the societies in the United States include numbers of socialists, and perhaps even more followers of Henry George in advocacy of the nationalization of the land and the "single tax." The death of Henry George (1897) has not ended his influence. On the other hand the socialists without compromise have had a "Socialistic Labor Party" since 1877. Bellamy's socialistic Utopia, *Looking Backward* (1888), caused nearly as great a sensation as Henry George's *Progress and Poverty* (1879). It led to the movement called "Nationalism," the scope of which was the nationalizing of the means of production generally. Of a less literary sort was the influence of "Populism" and the People's party (formed in 1889). Mixed up with the politics of W. J. Bryan in 1896, it lost a little of its uncompromising socialistic flavour.

General Criticisms.—If the ideal of state socialism be viewed in an equally critical spirit, many of the objections brought by the moderate anarchists are seen to have their weight. A strong central government to which all power was given over all the chief industries in the country would, they say, be contrary to liberty. Our leaders would be too likely to become again our masters. Supervision would become irksome. Great powers would be a temptation to abuse of power. A democracy with a strong central government would need to leave much to its chosen guardians, and to retain the same men in the position of guardians till they fully learned the difficult business of their office; but this in the end means either what we have now, a government by elected leaders, who, once elected, consult our wishes only on rare occasions,—or a government by permanent officials, which means liberty to go on in the old ways but great fear and jealousy of new ways, in fact, order without progress, no liberty of change.

This criticism becomes rather stronger than weaker if we press the doctrine of the supremacy of the working-classes, a doctrine that figures largely with some socialists. We are told that having been nothing, the working-classes will be everything; having so long been the ruled, they will be the rulers; they have produced for all the rest, the product will now be theirs instead of another's. This doctrine is not essential to socialism; it is indeed hardly consistent therewith. It would not be fair to press it, for no men know better than the scientific socialists that under modern conditions it is in most cases quite impossible to say what is the product of one man's labour. Articles are not made at one stretch by one individual. The contributions of the various hands and minds concerned from first to last in the production of a pocket-knife or a pair of trousers would travel over our stage like Banquo's ghostly descendants in a line that seemed to have no ending. What the socialists demand, when they are not declaiming to uncritical sympathizers, is not that a man should have what he makes but that what is made by great capitals or on great estates should be so distributed that it is not engrossed by individuals, but satisfies the wants of as many as possible. There is no superior enlightenment in the ordinary unskilled or even skilled manual labourer to fit him above others for supreme power. According to socialists and anarchists and indeed all of us who are not incurable optimists, the hungry generations have trodden the working man down too much to make him instantly or even speedily fit to do the work of government himself. He is of like passions with ourselves. He will be perfectly qualified in process of time to share in such responsible work. But at present he needs training.

The anarchists for their part do not desire the concentration of industry and the rule of it from the centre by anybody, working man or not—and they think the social democrats quite wrong in believing the concentration inevitable. They point to the fact that at the present moment there is a partial revival of domestic industries, assisted by gas and electricity. These are the small industries of people with small means; they make a less imposing figure before the public than the great trusts, such as the Steel Trust, and the Shipping Trust. The sums involved are so immense that it might seem impossible for competitors to cope with the trusts; therefore, it is thought, the trusts will soon rule alone, and, lest they should rule ill, the state should take their place. A great combination approaches monopoly, and a far-reaching, wide-stretching monopoly (say of the carrying trade) might mean a public danger. Should we listen to our friends the socialists and avert the danger by making the state the monopolist?

There seems no proof of the necessity of this extreme step. Where there is political danger the old-fashioned method of regulation and control by the state seems quite equal to the occasion. As yet the trusts are on their trial and their success is not certain, still less their abuse of the success when it comes. Their monopoly is not an absolute monopoly; and they have a wholesome consciousness of the possibility of competitors. A government trust would have none such. In some instances there would be the further difficulty that to prevent political friction it would need to be a trust of several nations—an idea difficult to realize on such a scale and in such matters.

The English mind does not turn readily to state trusts; but it finds no difficulty in municipal and local trusts. Private local monopolies, like those of the water companies in London, were as troublesome to the locality as any universal monopoly of the article could be; and the remedy which even London must find for the troubles will be the municipal trust. There are few instances in England of successful appropriation by the state of a business formerly competitive; railways are still only regulated. But there are so many examples of successful appropriation by the local authorities that the future absorption by them or the central authority of habitually unruly companies which have contrived in any way to abuse their monopoly may be deemed almost certain. The great demand of the scientific socialists is thus likely in England at least to break up into smaller separate demands that will obtain their answer separately by patient political action.

Socialism is making progress, but not to any great extent state socialism. New Zealand itself, where it has perhaps done most and best, is not a proof to the contrary, the province of Ontario in Canada having twice the area and population. Rather is it true that the state is more decidedly regulative. The ultimate result, to judge by the old countries, may be that each nation will include a community of groups more or less socialistic in organization, but will not itself be a socialistic state. The socialistic experiment is more likely to be tried by provinces than by states, by districts than by provinces, by towns than by districts. They all get their compulsory powers, as delegated to them, from the central authority; but the central authority itself has shown little power of originative action, and it lacks the minute knowledge of the people on the spot. The one or two great industries and businesses (railways, post office, telegraphs, forests, census, coinage, in some countries) that have formed the chief public works that are everybody's business and nobody's business, will probably remain a state concern; but the limits to the state's activity *except in regulation* soon arrive. On the other hand, there is no visible assignable limit to municipal or local socialism, as long as the state's parliament leaves it a free course. If the localities choose to make social experiments there seems no rule of general policy to prevent them, if we put aside experiences of financial failure or of the tendency to corruption. The great fear conjured up by the vision of socialism has been the fear of a new despotism. The despotisms of some hundreds of local bodies are likely to checkmate one another, or at least always likely by their varieties of pattern to provide a means of escape for individuals unhappy under the rule of any one of them.

Anarchism, when at all rational, resolves the state into its component municipalities and small groups. The question which carries us beyond anarchism is how such groups can last and be secure without a central state. They could only be so on the assumption of a change in human nature of which there is no sign. It seems not improbable that in the far future the strong central government will be so democratic and at the same time so wise with the wisdom of a great representative council that all that is sound in the contentions and aspirations of anarchists and socialists will be secured by it. Before such a future arrives, we can best prepare for it by seeing to it whether in a new country or an old that our representative system represents us *at our best*. Our small councils and our great councils will not of themselves become cleaner for having larger powers. If they are not clean they are a public danger. If they are clean, the coming socialism, whatever be its precise complexion, need have no terrors. It too will represent the people at their best.

Bibliography.—For the writings of Owen, Marx, &c., see under their names. For the general history see John Rae's *Contemporary Socialism*. For German socialism more particularly W. H. Dawson's *German Socialism and Ferdinand Lassalle*. See also *Karl Marx and the Close of his System*, by Böhm Bawerk (translated by Mrs J. M. Macdonald, 1898), *Der Verein für Socialpolitik und seine Wirksamkeit auf dem Gebiete der gewerblichen Arbeiterfrage*, by Dr E. Conrad (1906). For English recent developments, J. Ramsay Macdonald's *Socialism and Society*, as well as Sidney Webb's *Socialism in England*; also articles in *The Times* (London) during January 1909. For Australia and New Zealand, W. P. Reeves's *State Experiments in Australia and New Zealand* (1902). For the United States J. G. Brooks's *Social Unrest* (1903). For municipal socialism see Major Darwin's *Municipal Trade* (1903), and Dr F. C. Howe's *Municipal Ownership in Great Britain* (Bulletin of U.S. Bureau of Labor); also *Municipal and Private Operation of Public Utilities* (Report of National Civic Federation, New York, 1907) and *Municipal Corporations (Reproductive Undertakings)* (Return to House of Commons, 1902), 141 pages of statistics. On the nationalizing of railways see debate in House of Commons 11th February 1908; also the article Railways: *Economics*. For Italy, Bolton King's "Recent Social Legislation in Italy," *Economic Journal* (1903); and for France, J. L. Jaurès' *Histoire du socialisme*, and Ch. Gide's "Economic Literature in France," *Economic Journal* (1907). (J. B.)

SOCIAL SETTLEMENTS, associations of men and women of the educated classes who take up residence in the poorer quarters of great cities for the purpose of bringing culture, knowledge, harmless recreation, and especially personal influence to bear upon the poor in order to better and brighten their lives. Practically, the watchword of such settlements is personal service. To Arnold Toynbee (*q.v.*) may be given the credit of leading the way in this direction, and the Hall which Canon Barnett established (in 1885) to his memory in the east end of London was the first material embodiment of the movement. Since then many settlements of the same or similar nature have sprung up in Great Britain and America, some too on the continent of Europe and some in India and Japan. The sympathies of young men at the universities have been enlisted towards the movement, and an Oxford house, a Cambridge house, and other university missions have been founded in London. There are also many in connexion with various religious bodies. The practical spirit is shown in the formation of gilds, camps and institutes. Lads and girls, and even children, are gathered together; efforts being made to organize for them not only educational and religious opportunities, but harmless recreation, while the dwellers in the settlements share in the games and identify themselves most sympathetically with all the recreations. Many of the residents take also a considerable share in the work of local administration. Women's settlements probably are more general in the United States than in Great Britain; but in both countries they carry out a great variety of useful work, providing medical mission dispensaries, district nurses, workrooms for needle-women, hospitals for women and children, &c.

See W. Reason, *University and Social Settlements* (1898); S. Coit, *Neighbourhood Guilds* (1892); G. Montgomery, *Bibliography of College, Social, University and Church Settlements* (Boston, 1900).

SOCIETIES, LEARNED. Under ACADEMIES will be found a general account of the principal bodies of which that word forms part of the titles, usually denoting some kind of state support or patronage. But that account excludes a number of important scientific, archaeological, and literary societies, chiefly founded and carried on by private collective effort. Most of the institutions hereinafter mentioned are still flourishing. Fine art societies are not included.

In their modern form learned and literary societies have their origin in the Italian academies of the Renaissance: private scientific societies arose chiefly during the 19th century, being due to the necessity of increased organization of knowledge and the desire among scholars for a common ground to meet, compare results, and collect facts for future generalization. These bodies rapidly tend to increase in number and to become more and more specialized, and it has been necessary to systematize and co-ordinate their scattered work. Many efforts have been made from time to time to tabulate and analyse the literature published in their proceedings, as, for instance, in the *Repertorium* of Reuss (1801–1821) and the *Catalogue of Scientific Papers* of the Royal Society (1867–1902) for physics and natural science, with its subject indexes and the indexes of Walther (1845) and Koner (1852–1856) for German historical societies. A more recent example may be found in G. L. Gomme's *Index of Archaeological Papers* (1907). A further development of the work done by societies was made in 1822, when, chiefly owing to Humboldt, the *Gesellschaft deutscher Naturforscher und Ärzte* first met at Leipzig. This inauguration of the system of national congresses was followed in 1831 by the *British Association for the Advancement of Science*, which has served as the model for similar societies in France, America, Italy, Australia and South Africa. The merit of introducing the idea of migratory congresses into France is due to the distinguished archaeologist, M. Arcisse de Caumont (1802–1873), who established the *Association Normande*, which from 1845 held a reunion in one or other of the towns of the province for the discussion of matters relating to history, archaeology, science and agriculture, with local exhibitions. From the same initiation came the *Congrès Archéologique de France* (1834), which was organized by the *Société Française pour la Conservation des Monuments Historiques*, the *Congrès Scientifique*, which held its first meeting at Caen in 1833 (directed by the *Institut des Provinces*), and the *Congrès des Sociétés Savantes des Départements*, which for many years after 1850 held its annual sittings at Paris. The idea received the sanction of the French government in 1861, when a *Congrès des Sociétés Savantes* was first convoked at the Sorbonne by the minister of public instruction, who had in 1846 produced an *Annuaire des Sociétés Savantes*. In Italy Charles Bonaparte, prince of Canino, started an association with like objects, which held its first meeting at Pisa in 1839. Russia has had an itinerant gathering of naturalists since 1867. International meetings are a natural growth from national congresses. Two remarkable examples of these cosmopolitan societies are the *Congrès International d'Archéologie et d'Anthropologie Préhistoriques*, founded at Spezzia in 1865, and the *Congrès International des Orientalistes* (1873).

I. SCIENCE GENERALLY

UNITED KINGDOM.—First in antiquity and dignity among English societies comes the ROYAL SOCIETY (*q.v.*) of London, which dates from 1660. In 1683 William Molyneux, the author of *The Case of Ireland Stated*, exerted himself to form a society in Dublin after the pattern of that of London. In consequence of his efforts and labours the *Dublin Philosophical Society* was established in January 1684, with Sir William Petty as first president. The members subsequently acquired a botanic garden, a laboratory and a museum, and placed themselves in communication with the Royal Society of London. Their meetings after 1686 were few and irregular, and came to an end at the commencement of hostilities between James II. and William III. The society was reorganized in 1693 at Trinity College, Dublin, where meetings took place during several years. On 25th June 1731, chiefly owing to the exertions of Dr S. M. Madden, the *Dublin Society for Improving Husbandry, Manufactures, and other Useful Arts* came into existence. In January 1737 they commenced to publish the *Dublin Society's Weekly Observations*, and in 1746 the society was placed on the civil establishment, with an allowance of £500 a year from the government. A charter of incorporation was granted in 1750, and seven years later the *Royal Dublin Society* for the first time owned a house of its own, and in the following year began the drawing school, which subsequently did so much for Irish art. Between 1761 and 1767 government grants to the amount of £42,000 for promoting national agriculture and manufactures were distributed by the society, which claims to be the oldest scientific body in the United Kingdom after the Royal Society of London. It has published *Transactions* (1799, &c.); and its *Proceedings* (1764–1775; 1848, &c.) and *Journal* (1856–1876, &c.) are still issued. The *Dublin Univ. Phil. Soc.* issues *Proceedings*. For the *Royal Irish Academy*, see ACADEMIES.

The *Royal Physical Society of Edinburgh* was instituted in 1771, and incorporated in 1788; it is exclusively devoted to natural history and the physical sciences. With it have been merged many other societies, such as the *Chirurgo-Medical* in 1796, the *American Physical* in 1796, the *Hibernian Medical* in 1799, the *Chemical* in 1803, the *Natural History* in 1812 (which brought in Brougham and Mackintosh) and the *Didactic* in 1813. It issues *Transactions* and *Proceedings* (1858, &c.). From the *Philosophical Society of Edinburgh* (1731) was developed the *Royal Society of Edinburgh*, whose charter is dated 29th March 1783. It was to comprise a physical and a literary class; among the members of the latter were Robertson, Hume, Burke and Reid, and among those of the former Hutton, Black, Playfair, Dugald Stewart and Watt. The literary division has been much less productive than the other. A second charter was obtained in 1811. The society has published *Transactions* (4to, 1788, &c.) and *Proceedings* (8vo, 1832, &c.). The *Royal Scottish Soc. of Arts* (1821) publishes *Transactions*.

The *Linnean Society* for the promotion of zoology and botany was founded in 1788 by Dr (afterwards Sir) J. E. Smith, in order to supplement the work of the Royal Society, and obtained a royal charter in 1802. The herbarium and collections of Linnaeus, with the founder's additions, were purchased after his death. It removed from Sir Joseph Banks's old house in Soho Square to Burlington House (London) in 1857, and assumed the apartments it now occupies in 1873. It has published *Proceedings* (1849, &c.). The *Journal* (8vo, 1856, &c.) and the *Transactions* (4to, 1791, &c.) are divided into zoological and botanical sections. The *Society for the Encouragement of Arts, Commerce, and Manufactures* took its origin in 1753 from an academy established in the Strand by the landscape painter William Shipley. Attention was paid to the application of science to practical purposes, a subject passed over by the Royal Society. Exhibitions of pictures by native artists were held, and the first exhibitions of the Royal Academy took place in its rooms. A fresh start in a new career was made by the *Society of Arts* (since 1909 known as the *Royal Society of Arts*) in 1847, when it obtained a charter and the presidency of the Prince Consort. The International Exhibition of 1851 sprang from the smaller exhibitions previously held in its rooms. The East Indian section dates from 1869, the foreign and colonial and the chemical sections from 1874. Its organs have been *Transactions* (1783–1849) and the *Journal* (1853, &c.). Sir Joseph Banks, Count Rumford and other fellows of the Royal Society started the *Royal Institution* in 1799, when a site was purchased in Albemarle Street for "an establishment in London for diffusing the knowledge of useful mechanical improvements," to "teach the application of science to the useful purposes of life." The institution was incorporated in the following year. One of the most important epochs in the history of chemistry must be dated from the establishment of the laboratory where Davy and Faraday pursued their investigations. Belonging to the institution are foundations for professorships in natural philosophy, chemistry and physiology. Courses of lectures on special subjects are given as well as discourses (once a week) of a more general and literary character. Its *Journal* has been issued since 1802. The *London Institution* was established on a similar basis in 1805 and incorporated in 1807. The building in Finsbury Circus was erected in 1819. The *British Association for the Advancement of Science* was instituted at York on 27th September 1831, an imitation of the itinerant scientific parliament held in Germany since 1822 (already referred to), and arose from a proposal by Sir D. Brewster. A meeting is held annually at some place in the British empire chosen at a previous meeting. The object of the association is to promote science, to direct general attention to scientific matters, and to facilitate intercourse between scientific workers. Abstracts of the proceedings and reports of committees are published in the annual *Report* (1833, &c.). The *Historical Society of Science* (1841) printed a couple of volumes; and the *Ray Society* (1844), instituted for the printing of original and scarce old works in zoology and botany, still flourishes. The *Royal Colonial Institute* was founded in 1868 and incorporated in 1882. It provides a place of meeting for gentlemen connected with the colonies and British India, undertakes investigations into subjects relating to the British empire, has established a museum and library, and gives lectures in its new building in Northumberland Avenue (London). It has published *Proceedings* since 1870. The *Victoria Institute*, or *Philosophical Society of Great Britain*, was founded in 1865 to form a connecting bond between men of science and others engaged in investigating important questions of philosophy and science, more especially those bearing upon the truths revealed in Holy Scripture. Its organ is the *Journal* (1867, &c.). The *Royal Asiatic Society* and the *East India Association* (1866) publish *Journals*. The *African Society* meets at the Imperial Institute and publishes a

Journal. The *Selborne Soc*. (1885) promotes nature study and issues a *Mag*. The foundation in 1821 of the *Society for the Encouragement of the Useful Arts in Scotland*, now usually known as the *Royal Scottish Society of Arts*, for the promotion of the useful arts and such branches of science as bear upon them, was due to Sir D. Brewster, Sir J. Mackintosh and others; it was incorporated in 1841, and has published *Transactions* since that year.

The leading provincial societies of Great Britain of a general character are as follows:—Aberdeen, *Nat. Hist. Soc*. (1863), *Trans.*; *Phil. Soc*. (1840). Alloa, *Soc. of Nat. Hist. and Arch*. (1863), *Proc*. (1865, &c.). Banff, *Banffshire Field Club and Sc. Soc*. (1880), *Proc*. Bath, *Nat. Hist. and Antiq. Field Club* (1866), *Proc*. (1867, &c.); *Roy. Lit. and Sc. Inst*. (1825), *Proc.*; *Bath Lit. and Phil. Assn*. Bedford, *Bedfordshire Nat. Hist. Soc*. (1875), *Trans*. Belfast, *Nat. Hist. and Phil. Soc*. (1821), *Proc*. (1852, &c.), museum; *Naturalists' Field Club* (1863), *Proc*. (1875, &c.). *Berwickshire Naturalists' Club* (1831), *Proc*. (1834, &c.). Birkenhead, *Lit. and Sc. Soc*. (1857). Birmingham, *Nat. Hist. and Phil. Soc*. (1858), *Trans.*; *Birmingham and Midland Institute Sc. Soc*. (1870), *Trans*. of archaeological section (1871, &c.); *Phil. Soc*. (1876) has a fund for promotion of original research, *Proc.*; *Midland Union of Nat. Hist. Societies* (1877), *Midland Naturalist*. Bolton, *Lit. and Phil. Soc*. (1871). Bradford, *Phil. Soc*. (1865); *Bradford Scientific Assn*. (1875), *Journal*. Brighton, *Brighton and Hove Nat. Hist. and Phil. Soc*. (1855), *Proc*. Bristol, *Naturalists' Soc*. (1862), *Proc*. (1866, &c.). Burnley, *Lit. and Sc. Club* (1873), *Trans*. Burton-on-Trent, *Nat. Hist. and Arch. Soc*. (1876), *Trans*. Cambridge, *Phil. Soc*. (1819; incorporated 1832), for the promotion of philosophy and natural science, owns museum and library, *Proc*. (1843, &c.), *Trans*. (1821, &c.). Cardiff, *Naturalists' Soc*. (1867), *Trans*. Chester, *Soc. of Nat. Sc., Lit. and Arts* (1871). Cork, *Royal Inst*. (1807), library; *Cuvierian and Arch. Soc*. (1836). *Cornwall Royal Inst.*, at Truro (1818), devoted to natural philosophy, natural history, and antiquities, *Journal* (1864, &c.); *Royal Cornwall Polytechnic Soc*., at Falmouth (1833; founded by the daughters of R. W. Fox and others), for the encouragement of science and the fine and industrial arts, *Trans*. (1835, &c.). *Cumberland Assoc. for the Advancement of Lit. and Sc*. (1876), provided a means of union for the local societies of Cumberland and Westmoreland, *Trans*. *Derbyshire Arch. and Nat. Hist. Soc*. (1878), *Journal*. *Derry Nat. Hist. and Phil. Soc*. (1870). *Devonshire Assoc. for the Advancement of Sc*. (1862). *Dorset Nat. Hist. and Antiq. Field Club* (1875), *Proc*. *Dumfriesshire and Galloway Sc., Nat. Hist. and Antiq. Soc*. (1876), *Trans*. Dundee, *Naturalists' Soc*. (1873). Eastbourne, *Nat. Hist. Soc*. (1867), *Proc*. (1869, &c.). *East of Scotland Union of Naturalists' Societies* (1884), *Trans*. Ebbw Vale, *Lit. and Sc. Inst*. (1850). Elgin, *Elgin and Morayshire Lit. and Sc. Assoc*. (1836). *Essex Field Club* (1880), museums at Stratford and Chingford. Exeter, *Naturalists' Club and Arch. Assoc*. (1862). Glasgow, *Roy. Phil. Soc*. (1802), *Proc*. (1844, &c.); *Nat. Hist. Soc*. (1851), *Proc*. (1868, &c.); *Soc. of Field Naturalists* (1872), *Trans*. (1872, &c.); *Andersonian Naturalists' Soc*. Gloucester, *Lit. and Sc. Assoc*. (1838). Greenock, *Phil. Soc*. (1861). Halifax, *Phil. and Lit. Soc*. (1830), museum and library. Hereford, *Woolhope Naturalists' Field Club*, *Hereford Pomona and Trans*. (1866, &c.). *Hertfordshire Nat. Hist. Soc. and Field Club*, formed in 1879 from the *Watford Nat. Hist. Soc*. (1875), *Trans*. High Wycombe, *Nat. Hist. Soc*. (1865), *Magazine* (1866, &c.). Hull, *Lit. and Phil. Soc*. (1822), *Trans*. (1824, &c.). Inverness, *Sc. Soc. and Field Club* (1875). *Isle of Wight Phil. and Sc. Soc*. (1850). *Kent (East) Nat. Hist. Soc*. at Canterbury (1858), *Trans*. Leeds, *Phil. and Lit. Soc*. (1820); *Naturalists' Club* (1870), *Trans*. Leicester, *Lit. and Phil. Soc*. (1835), *Trans*. Lewes, *Lewes and East Sussex Nat. Hist. Soc*. (1864). Liverpool, *Lit. and Phil. Soc*. (1812; united with *Nat. Hist. Soc*. in 1844), *Proc*. (1845, &c.); *Philomathic Soc*. (1825), *Trans.*; *Polytechnic Soc*. (1838), *Journal* (1838, &c.); *Naturalists' Field Club* (1860). Manchester, *Lit. and Phil. Soc*. (1781), two sections, one physical and mathematical, the other for microscopy and natural history—the original statements respecting the atomic theory were given by Dalton in the *Memoirs* (1789, &c.), also *Proc.*; *Field Naturalists' and Arch. Soc*. (1860), *Proc.*; *Scientific Students' Assoc*. (1861). Montrose, *Nat. Hist. and Antiq. Soc*. (1836), museum. Newbury, *District Field Club* (1870), *Trans*. (1871, &c.). Newcastle-on-Tyne, *Lit. and Phil. Soc*. (1793), library; *Northumberland, Durham and Newcastle Nat. Hist. Soc*. (1829), a museum (opened in 1884), *Trans*. Norfolk, *Norfolk and Norwich Naturalists' Soc*. (1869), *Trans*. (1870, &c.). Nottingham, *Lit. and Phil. Soc*. (1864); *Naturalists' Soc*. (1852), *Trans*. *Orkney Antiq. and Nat. Hist. Soc*. (1837), museum. Oxford, *Ashmolean Nat. Hist. Soc*. (1828), *Proc*. Paisley, *Phil. Institution* (1808), free library and museum; Mr Coats presented his observatory in 1882. Penzance, *Nat. Hist. and Antiq. Soc*. (1839), museum, *Proc*. (1845, &c.). Perth, *Lit. and Antiq. Soc*. (1784); *Perthshire Soc. of Nat. Sc*. (1867), *Proc*. (1869, &c.), the *Scottish Naturalist* (1870, &c.). Peterhead, *Buchan Field Club* (1887), *Trans*. Plymouth, *Plymouth Inst. and Devon and Cornwall Nat. Hist. Soc*. (1812), museum, art gallery and library. *Preston Sc. Soc*., affiliated with *British Assn*. Richmond, *Richmond and North Riding Naturalists' Field Club* (1863), *Trans*. Ripon, *Naturalists' Club and Sc. Assoc*. (1882). *Rochdale Lit. and Sc. Soc*., *Trans*. Scarborough, *Phil. and Arch. Soc*. (1831), museum and library. *Severn Valley Naturalists' Field Club*, at Bridgenorth (1863). Sheffield, *Lit. and Phil. Soc*. (1822); *Museums Assoc*. (1889), *Proc. and Journ*. *Shetland Lit. and Sc. Soc*. at Lerwick (1861). *Shropshire and North Wales Nat. Hist. and Antiq. Soc*. (1835), at Shrewsbury. *Somersetshire Arch. and Nat. Hist. Soc*., at Taunton (1849), *Proc*. (1851, &c.). Southampton, *Hartley Institution* (founded under bequest of H. R. Hartley in 1859, incorporated 1862), for the promotion of scientific, antiquarian and Oriental studies and the fine arts, owns a museum and library. *Staffordshire (North) Field Club and Arch. Soc*. (founded as a natural history society in 1865; enlarged 1877), meets at Stone, *Trans*. Stirling, *Nat. Hist. and Arch. Soc*. (1878), *Trans*. Stockport, *Soc. of Naturalists* (1884), *Trans*. *Suffolk Inst. of Arch. and Nat. Hist*., at Bury St Edmunds (1848), *Proc*. (1848, &c.), *The East Anglian* (1859, &c.). Swansea, *Royal Institution of South Wales* (founded 1835; incorporated 1883), with a museum and library, promotes natural history and applied science, literature and fine arts, local history and antiquities. Tamworth, *Nat. Hist., Geolog. and Antiq. Soc*. (1871). *Teign Naturalists' Field Club* (1858). Torquay, *Nat. Hist. Soc*. (1844), museum and library. *Tweedside and Kelso Physical and Antiq. Soc*. (1834). Warrington, *Lit. and Phil. Soc*. (founded in 1870 upon the *Micr. Soc*.). *Warwickshire Nat. Hist. and Arch. Soc*. (1836); *Warwickshire Field Club* (1854). Whitby, *Lit. and Phil. Soc*. (1822). *Whitehaven Sc. Assn., Journal*. *Wiltshire Arch. and Nat. Hist. Soc*., at Devizes (1853), *Wiltshire Magazine* (1853, &c.). Windsor, *Windsor and Eton Sc. Soc*., *Trans*. Witney, *Nat. Hist. and Lit. Soc*. (1858). *Yorkshire Phil. Soc*. (1822), the museum in the grounds of St Mary's Abbey, York, contains a remarkable collection of Roman remains; *Naturalists' Union* of the natural history and scientific societies of the county (founded in 1861 as the *West Riding Consolidated Naturalists' Soc*., reorganized in 1876), publishes the *Naturalist* (1876, &c.), *Trans*.

Australia and New Zealand: Adelaide, *Phil. Soc., Trans*. (1865, &c.); *South Australian Inst*. (1836), library; *Roy. Soc. of S. Australia* (1853), *Trans., Proc., Reports*. Auckland, *Auckland Inst*. Brisbane, *Queensland Phil. Soc*. (1860), now the *Roy. Soc. of Queensland* (1884), *Proc*. Christchurch, *Phil. Inst*. Hobart Town, *Roy. Soc. of Tasmania, Papers and Proc*. (1843, &c.). Melbourne, *Roy. Soc. of Victoria, Trans*. and *Proc*. (1854, &c.); *Nat. Hist. Soc.*; *Zool. and Acclim. Soc., Proc*. (1872, &c.). Sydney, *Roy. Soc. of N.S. Wales* (1821), *Proc*. (1867, &c.); *Linnean Soc. of N.S. Wales* (1874), *Proc*. (1875, &c.); *Phil. Soc., Trans*. (1862, &c.); *Australasian Assoc. for Advancement of Sc., Reports of Annual Meetings* (held at different place each year) (1888, &c.). Wellington, *New Zealand Inst., Trans. and Proc*. (1868, &c.).

Canada: Halifax, *Nova Scotia Inst. of Sc., Proc*. and *Trans*. (1862, &c.). Montreal, *Nat. Hist. Soc. of Montreal* (1827), *Canadian Rec. of Sc*. Ottawa, *Roy. Soc. of Canada, Trans*. (3 ser.) (1882, &c.); *Lit. and Sc. Soc*. (1870), *Trans*. (1897, &c.). St John, *Nat. Hist. Soc. of N. Bruns*. (1862), *Bulletins* (26 vols.). Toronto, *Canadian Inst*. (1849), *Trans*. and *Proc*. (1852, &c.); *Roy. Canadian Acad. of Arts* (1880). Winnipeg, *Hist. and Sc. Soc*.

South Africa: Cape Town, *South Afr. Phil. Soc., Trans*. (1878, &c.).

West Indies: Kingston, *Roy. Soc. of Arts of Jamaica, Trans*. (1854, &c.); Port of Spain, *Sc. Assoc. of Trinidad, Proc*. (1866, &c.).

India, &c.: Calcutta, *Asiatic Soc. of Bengal* (1784), *Journal* (1832, &c.; 1865, &c.), *Bibl. Indica* (1848, &c.), *Mem*. (1905, &c.). Singapore, *Roy. Asiatic Soc*. (*Straits Br.*), *Journal* (1880, &c.). Shanghai, *Roy. Asiatic Soc*. (*N. China Br.*), *Journal* (1857, &c.). Cairo, *Inst. Egyptien* (1859). Mauritius, *Roy. Soc. of Arts and Sc., Proc*. (1846, &c.) and *Trans*. (1848, &c.).

United States.—The Smithsonian Institution (*q.v.*), the most important scientific body in America, is dealt with in a separate article. The first scientific society in the United States originated from a *Proposal for Promoting Useful Knowledge among the British Plantations*, issued by Dr Franklin in 1743. In the following year the *American Philosophical Society* was founded at Philadelphia, with Thomas Hopkinson as president and Franklin as secretary. With it was united on 2nd January 1769 another Philadelphia society, *The Junto* (1758), the records of which have been preserved. The *American Philosophical Society* is still in vigorous life, and is an exclusively scientific body and the oldest organized society in the United States for the pursuit of philosophical investigation in its broadest sense. It publishes *Transactions* (4to, 1771, &c.) and *Proceedings* (8vo, 1838, &c.). Second in point of date comes the *American Academy of Arts and Sciences* of Boston, incorporated in 1780 with the object of furthering the study of the antiquities and natural history of the country. Its *Memoirs* (4to, 1785, &c.) and *Proceedings* (8vo, 1846, &c.) are still published. The *Connecticut Academy of Arts and Sciences* was incorporated at New Haven in 1799. At first only devoted to matters connected with the state of Connecticut, it now embraces the whole field of the sciences and useful arts. It has issued *Memoirs* (1810–1816), and now publishes *Transactions* (1866, &c.). One of the leading societies in the United States, the *Academy of Natural Sciences* of Philadelphia, founded in 1812 and incorporated in 1817, possesses an excellent library; the natural history museum is especially rich in conchology. It issues a *Journal* (1817, &c.) and *Proceedings* (1843, &c.). The *American Entomological Society* is merged with it. The *Franklin Institute* of the same city, incorporated in 1825, possesses a library, gives lectures and issues a *Journal* (1826, &c.). The *Boston Society of Natural History* was founded upon the *Linnean Society* (1814) in 1830 and incorporated in 1831. It possesses a library and a cabinet of specimens. It has published the *Boston Journal of Natural History* (8vo, 1837–1863), *Memoirs* (4to, 1866, &c.) and *Proceedings* (1841, &c.). The *Lyceum of Natural History*, New York, was incorporated in 1818 and has published *Annals* from 1823 (1824, &c.) and *Proceedings* (1870, &c.). In 1875 the name was changed to *New York Academy of Sciences*. A number of American naturalists and geologists, having held meetings in various cities between 1840 and 1847, resolved themselves at their Boston congress in the latter year into the *American Association for the Advancement of Science*, which was incorporated in 1874. Its object is "by periodical and migratory meetings to promote intercourse between American scientists." It has published *Proceedings* (1849, &c.). The *National Academy of Sciences* was incorporated at Washington in 1863 with a view to making the knowledge of specialists available for the service of government. There are two classes of members, those in mathematics and physics and those in natural history. It has issued *Annuals* (Cambridge, 1865, &c.) and *Reports*, as well as *Memoirs* (1866, &c.). The *Academies of Sciences* at San Francisco (1853), St Louis (1856, incorporated 1857), and Chicago (1857, incorporated 1865) deserve special mention.

Among the remaining societies of a general scientific character are—*Albany Inst.* (1829), *Trans.* (1830–1893), *Proc.* (1873–1882). Ann Arbor, *Mich. Ac. of Sc.* (1894). Baltimore, *Maryland Acad. of Sc., Trans.* (1901). Boston, *Col. Soc. of Mass.* (1892), *Trans. Brooklyn Inst. of Arts and Sc.* Buffalo, *Soc. of Nat. Sc.* (1861), *Bull. Cincinnati, Soc. of Nat. Hist.* (1870), *Journal* (1878, &c.); *Cin. Museum Assoc.* (1881). Cleveland, *Acad. of Nat. Sc.* (1852), *Annals and Proc.*; *The Cleveland Society* [Archaeol. Inst. of America] (1895). Columbus, *Ohio State Acad. of Sc.* (1891), *Publ.* Des Moines, *Iowa Acad. of Sc.* (1887), *Proc.*; Hartford, *Sc. Soc.* (1896); formerly *Hartford Soc. of Nat. Sc.* (1885), *Bull.* (1902, &c.). Indianapolis, *Indiana Acad. of Sc.* (1885), *Proc.* (1891, &c.). Ithaca, *Amer. Phil. Assoc.* (1902). Lincoln, *Nebraska Acad. of Sc.* (1891), *Publ.* Los Angeles, *South California Acad. of Sc.* (1891), *Bull.* Madison, *Wisconsin Acad. of Sc. Arts and Letters, Trans.* (1870, &c.). Milwaukee, *Wisconsin Nat. Hist. Soc.* (1857), *Bull.* [Minneapolis, *Minnesota Acad. of Sc., Bull.* (1873, &c.). *Minneapolis Acad. of Fine Arts* (1883), *Bull.* (1905). New Orleans, *Athenée Louicianais* (1876), *Comptes Rendus*. New York, *Amer. Inst. of the City of New York* (1829), *Journal* (1834), *Trans.* (1841, &c.); *Amer. Inst. for Sc. Research* (1904), *Proc.* and *Journal*. Portland (Maine), *Soc. of Nat. Hist.* (1850), *Proc.* (1862, &c.). Poughkeepsie, *Vassar, Brothers' Inst.* (1874), *Proc.* (1874, &c., 1876, &c.). *Rochester Acad. of Nat. Sc.* (1881) *Trans.* Salem (Mass.), *Essex County Nat. Hist. Soc.* (1833; now merged in the *Essex Institute*) published the *American Naturalist* (1867–1868), afterwards issued by the *Peabody Acad. of Science*, as well as *Proc.* (1856, &c.) and *Bulletin* (1869, &c.). San Francisco, *Tech. Soc. of the Pacific Coast* (1884), *Trans.* in *Journal of the Assoc. of Engineering Societies. Santa Barbara Society of Natural History* (1876), *Bull.* (1887). Sioux City, *Acad. of Sc. and Letters* (1887), *Proc.* (1903, &c.). Topeka, *Kansas Acad. of Science* (1868), *Trans.* Washington, *Phil. Soc. of Washington* (1871), *Bull.* (1874, &c.). Wilkes-Barré, *Wyoming Hist. and Geol. Soc.* (1858), *Proc.* and *Coll.* (1858, &c.).

FRANCE.—The *Institut de France* (see ACADEMIES), which includes five separate academies, stands at the head of all French societies. The *Société Philotechnique*, founded in 1795 and recognized as of public usefulness by a decree of 11th May 1861, had for its object the encouragement and study of literature, science and the fine arts; literary organ was an *Annuaire* (1840, &c.). The *Société d'Encouragement pour l'Industrie Nationale* was founded in 1801 for the amelioration of all branches of French industry, and was recognized by the state in 1824; *Bulletin*. The *Académie Nationale, Agricole, Manufacturière, Commerciale* was founded by the duc de Montmorency in 1830, and offers prizes and medals, and brings out a *Bulletin* (1830, &c.). The *Association Française pour l'Avancement des Sciences* (1872), founded on the model of the British Association, holds migratory meetings and publishes *Comptes rendus*. With it has been amalgamated the *Association Scientifique de France*, founded by Le Verrier in 1864.

The departmental societies are very numerous and active. The chief are the following: Abbeville, *Soc. d'Émulation* (1797), *Mém.* (1833, &c.). Agen, *Soc. d'Agr., Sc. et Arts* (1784), *Recueil* (1800, &c.). Aix, *Acad. des Sc., &c.* (1829), based on *Soc. des Amis de la Sc.* (1765), *Mém.* (1819, &c.). Alais, *Soc. Sc. et Litt.* (1868), *Bull.* (1868, &c.). Amiens, *Acad.*, based on *Soc. Litt.* (1750), *Mém.* (1835, &c.); *Soc. Linnéenne* (1838), *Mém.* (1866, &c.). Angers, *Soc. Acad. de Maine-et-Loire* (1857), *Mém.* (1857, &c.); *Soc. d'Agr., &c.* (1799), *Mém.* (1831, &c.); *Soc. Linn. de M.-et-L.* (1852), *Annales* (1853, &c.). Angoulême, *Soc. d'Agr., &c., de la Charente* (1803), *Annales* (1819, &c.). Annecy, *Soc. Florimontane* (1851), *Annales* (1851, &c.) and *Rev. Savoisienne* (1851). Apt, *Soc. Litt., Sc. et Art.* (1863), *Annales* (1865, &c.). Arras, *Acad.* (1737), *Mém.* (1818, &c.) and other publications. Autun, *Soc. Éduenne* (1836), *Mém.* (1872, &c.) and other publications. Auxerre, *Soc. des Sc.* (1847), *Bull.* (1847, &c.). Avignon, *Acad. de Vaucluse* (formerly the *Lycée d'Agr., &c.*, 1801), *Mém.* (1804), *Documents* and *Cartulaires*. Bar-le-Duc, *Soc. des Lettres, &c.* (1870), *Mém.* (1871, &c.). Bayeux, *Soc. des Sc., Arts et B.-Lett.* (1841), *Mém.* (1842, &c.). Beauvais, *Soc. Acad.* (1847), *Mém.* (1847, &c.), *Comptes Rendus* (1882, &c.). Belfort, *Soc. d'Émulation* (1872), *Bull.* (1872). Besançon, *Acad. des Sc., &c.* (1752; suppressed in 1793; re-established 1805), *Proc.-verb.* (1754, &c.), *Mém.* (1838, &c.); *Soc. d'Émulation* (1840), *Mém.* (1841, &c.). Béziers, *Soc. Arch., Sc.*, &c. (1834), *Bull.* (1836, &c.). Blois, *Soc. des Sc. et Lettres de Loir-et-Cher* (1832), *Mém.* (1833, &c.). Bordeaux, *Acad.* (1712; suppressed 1793; re-established 1816), *Actes* (1839, &c.); *Soc. Linn.* (1818), *Bull.* (1826–1829) and *Actes* (1830, &c.); *Soc. des Sc.* (1850), *Mém.* (1855, &c.). Boulogne, *Soc. Acad.* (1864), *Mém.* (1864, &c.). Bourg, *Soc. d'Émulation* (1755), *Journal* (1817–1868) and *Annales* (1868, &c.). Bourges, *Soc. Hist., &c., du Cher* (1849), *Mém.* (1857, &c.). Brive la Gaillarde, *Soc. Sc., Hist. et Archéol.* (1878), *Bull.* (1879, &c.). Caen, *Acad.* (1652), *Rec.* (1731–1816), *Mém.* (1825); *Soc. Linn.* (1823), *Mém.* (1824, &c.), and *Bull.* (1855, &c.); *Assoc. Normande* (1831), *Annuaire* (1835, &c.). Cahors, *Soc. des Études Litt., Sc. et Artistiques* (1872), *Bull.* (1873, &c.). Cambrai, *Soc. d'Émulation* (1804), *Mém.* (1808, &c.). Cannes, *Soc. des Sc.* (1868), *Mém.* (1869, &c.). Carcassonne, *Soc. d'Études, &c.* (1889), *Bull.* (1890, &c.). Chambéry, *Acad.* (1819), *Mém.* (1825, &c.). Châteaudun, *Soc. Dunoise* (1864), *Bull.* (1864, &c.). Cherbourg, *Soc. Acad.* (1755), *Mém.* (1833, &c.); *Soc. Nat.* (1851), *Mém.* (1852, &c.). Naturwiss. Kentnisse, Schriften* (1862, &c.). Wiesbaden, *Nassauischer Ver. f. Naturk.* (1829), *Jahrbücher* (1844, &c.). Zweibrücken, *Naturhist. Ver.* (1863), *Jahresber.* (1864, &c.).

SWITZERLAND.—Basel, *Naturforsch. Ges.* (1817), *Ber.* (1835, &c.) and *Verhandl.* (1835, &c.). Bern, *Soc. Helvétique des Sciences Nat.* (1815), *Actes* (1816, &c.), *Comptes rendus* (1879), *Mémoires* (1829, &c.). Chur, *Naturforsch. Ges., Jahresber.* (1856, &c.). Geneva, *Soc. de Phys. et d'Hist. Nat., Mém.* (1821, &c.); *Société des Arts* (Athénée), founded by H. B. de Saussure in 1776; *Institut National genevois* (1853), *Mém.* and *Bull.* Lausanne, *Soc. Vaudoise des Sc. Nat., Bull.* (1842, &c.). Neuchâtel, *Soc. des Sc. Nat., Mém.* (1835, &c.) and *Bull.* (1844, &c.). St Gall, *Naturwiss. Ges., Ber.* (1860, &c.). Solothurn, *Naturhist. Kantonal-Ges., Jahresber.* (1825, &c.). Zurich, *Naturforsch. Ges* (1746), *Abhandl.* (1761–1856), *Mittheil.* (1846, &c.), and *Vierteljahrsschr.* (1856, &c.); *Allg. Schweizer Ges. f. d. Naturwiss., Verhandl., Anzeiger*, and *Denkschr.* (1829, &c.).

ITALY.—*Congresso degli Scienziati Italiani, Atti* (1844–1845); *Riunione degli Sc. Ital., Atti* (1839–1847; 1873, &c.). Bologna, *Accad. delle Sc. dell' Istit. di Bologna* (1714), *Rendic.* (1833, &c.), and *Mem.* (1850, &c.). Brescia, *Accad.*, afterwards *Ateneo, Comment.* (1808, &c.). Catania, *Accad. Gioenia di Sc. Nat., Atti* (1825, &c.). Florence, *R. Museo di Fis. e Stor. Nat., Annali* (1808, &c.); *Soc. Asiatica Italiana* (1886), *Giornale.* Lucca, *R. Accad. Lucchese* (1584), *Atti* (1821, &c.). Messina, *R. Accad. Peloritana.* Milan, *Accad. Fis. Med. Statist., Diario ed Atti* (1846, &c.); *R. Istit. Lombardo, Mem.* (1819, &c.), *Giornale* (1840, &c.), *Atti* (1860, &c.), and *Rendic.* (1864, &c.); *Soc. Ital. delle Sc. Nat., Atti* (1860, &c.) and *Mem.* (1865, &c.). Modena, *R. Accad. di Sc., &c., Mem.* (1833, &c.); *Soc. Ital. delle Sc., Mem.* (1782, &c.). Naples, *R. Istit. d'Incoragg. alle Sc. Nat.* (1806), *Atti* (1811, &c.); *Soc. Reale di Napoli* (1808), consists of three sectional academies. Padua, *R. Accad. di Sc., Lett., ed Arti* (1779), *Saggi* (1786, &c.) and *Revista* (1851, &c.). Palermo, *R. Accad. di Scienze* (1722). Rome, *Soc. Ital. per il progresso delle Scienze* (1907). Venice, *R. Istit. Veneto di Sc.* (1838), *Atti* (1841, &c.) and *Mem.* (1843, &c.); *Ateneo Veneto*, two sections, literature and science. Verona, *Accad. d'Agricoltura, Scienze, Lettere, Arti e Commercio* (1768), *Atti* and *Memorie.*

BELGIUM.—Brussels, *Soc. Roy. des Sc. Nat. et Méd.* (1822), *Journ. de Méd.* (1842–1895) and *Annales* (1892, &c.); *Soc. Roy. Linn.* (1835), *Bull.* (1872, &c.); *Soc. scientifique de Bruxelles* (1875), *Revue* (1877, &c.), *Annales* (1877, &c.). Ghent, *K. Vlaamische Acad.* (1886). Liége, *Soc. Roy. des Sc.* (1835), *Mém.* (1843, &c.). Mons, *Soc. Prov. des Sc., &c., du Hainaut* (1833), *Mém.* (1839, &c.).

HOLLAND.—Amsterdam, *K. Nederlandsch Instituut, Proc.-verb.* (1808, &c.), *Verhandel.* (1812, &c.), *Tijdschrift* (1847); *Genootschap ter Beford. der Natuur-, &c., Kunde, Maanblad* (1807, &c.) and *Werken* (1870, &c.); *Hollandsche Maatschappij, Werken* (1810, &c.); *Maatschappij ter Befordering van het Natuurkundig onderzoek der Nederl. Kolonien* (1890), branches in Batavia and Paramaribo, *Notulen, Bulletins*, &c. Arnheim, *Natuurkundig Genootschap, Tijdschrift* (1844, &c.). Bois-le-Duc, *Provinc. Genootschap, Handelingen* (1837, &c.). Groningen, *Natuurk. Genootschap, Versl.* (1862, &c.). Haarlem, *Hollandsche Maatschappij der Wetensch.* (1752), *Verhandel.* (1754, &c.). The Hague, *K. Zoolog.-Botanisch Genootschap, Versl.* (1864, &c.). Luxembourg, *Soc. des Sc. Nat., Publ.* (1853, &c.). Middelburg, *Zeeuwsch Genootschap der Wetensch., Verhandel.* (1769, &c.) and *Archief* (1856, &c.). Utrecht, *Provinc. Genootschap van Kunsten en Wetensch.* (1773), *Verhandel.* (1781, &c.) and *Aanteekeningen* (1845, &c.) promotes the study of medicine, natural history, law and literature. Batavia, *Bataviaasch Genootschap van Kunsten en Wetensch.* (1778), *Verhandel.* (1781, &c.), *Tijdschrift* (1853, &c.), and *Notulen* (1862, &c.); *Natuurk. Vereeniging in Nederl. Indië* (1850), *Tijdschrift* (1851–1865) and *Verhandel.* (1856, &c.).

DENMARK.—Copenhagen, *K. Danske Videnskabernes Selskab*, based on *Kjöbenhavnske Selskab* (1743–1813), *Skrifter* (1781, &c.) and *Afhandlinger* (1824, &c.); *Naturhist. Forening, Meddelelser* (1849, &c.). Reykjavik, *Islenzka Náttúrufraedisfélag* (1889), *annual reports.*

SWEDEN.—Gottenburg, *K. Vetenskaps och Vitterhets Samhälle, Handlingar* (1778, &c.). Stockholm, *K. Svenska Vetenskaps Akademi, Handlingar* (1740, &c.) and *Årberättelser* (1820, &c.). Upsala, *K. Vetenskaps Societeten* (1710), *Acta* (1720, &c.).

NORWAY.—Christiania, *Physiographiske Forening, Mag. for Natur-Vidensk.* (1832, &c.); *Videnskabs-Selskabet* (1857), *Forhandl.* (1859, &c.), *Skrifter* (1894, &c.). Throndhjem, *K. Norske Vidensk.-Selskab, Skrifter* (1817, &c.).

SPAIN.—Barcelona, *R. Acad. de Buenas Letras*, the oldest Spanish society, *Mem.* and *Boletin*; *R. Acad. de Ciencias y Artes* (1763). Madrid, *R. Acad. de Cien. Exactas, Fis., y Nat.* (1847), *Mem.* (1850, &c.); *Soc. Expañ. de Hist. Nat., Anales* (1872, &c.). San Fernando, *R. Acad., Mem.*

PORTUGAL.—Coimbra, *Instituto de Coimbra* (1852). Lisbon, *Soc. Portugueza de Sciencias Naturais* (1907), *Bulletin* (1907, &c.).

RUSSIA.—*Siezd Russkikh Yestestvoispytately* (*Meeting of Russ. Naturalists*), first meeting at St Petersburg 1867–1868, *Trudy* or

Trans. (4to, 1868, &c.). Dorpat, *Naturforsch. Ges.* (1853), *Sitzungsber.* (1853, &c.) *Archiv* (1854, &c.) and *Trudy* (1884, &c.); *Gelehrte Estnische Ges., Verhandl.* (1840, &c.), *Schriften* (1863–1869) and *Sitzungsber.* (1861, &c.). Ekaterinburg, *Soc. of Naturalists* (1870), *Zapiski.* Helsingfors, *Societas pro Fauna et Flora Fennica* (1821), *Acta* (1875, &c.); *Finska Vetenskaps-Soc.* (1838), three sections. Kaminietz, *Naturforsch. Ges.* Kazan, *Soc. of Naturalists at University, Protokoly* (1870, &c.) and *Trudy* (1872, &c.). Kharkoff, *Soc. of Scientists at Univ., Trudy* (1870, &c.) and *Protokoly* (1870, &c.). Kieff, *Soc. of Naturalists, Zapiski.* Lemberg, *Polish Soc. for the Advancement of Science* (1901). Moscow, *Imp. Soc. of the Friends of Nat. Hist., Anthrop.*, &c. (1863), *Izviestiya* or *Bull.* (1865, &c.); *Soc. Imp. des Naturalistes* (1805), *Mém.* (4to, 1806) and *Bull.* (8vo, 1829, &c.). Odessa, *Soc. of Naturalists of New Russia, Zapiski* (1872, &c.) and *Protokoly* (1874, &c.). Riga, *Naturforsch.-Ver.* (1845), *Corr.-Blatt* (1846, &c.) and *Arbeiten* (1865, &c.). St Petersburg, *Imp. Soc. of Naturalists* (1868), *Trudy* (1870, &c.). Saratov, *Soc. of Naturalists* (1895), *Trudy* (1899, &c.). Warsaw, *Soc. of Friends of Sc., Roczniki* (1802–1828); *Warsaw Naturalists' Soc.* (1889).

Rumania.—Bucharest, *Acad. Română* (1866), *Annalile* (1867, &c.); *Soc. de Ştiinte* (1891); *Soc. Politechnică* (1881). Jassy, *Soc. Ştiinţifica şi Literară* (1889).

Greece.—Athens, Φιλολογικὸς σύλλογος Παρνασσός (1865), Παρνασσός and other publications; Ἡ ἐν Ἀθήναις Ἐπιστημονικὴ Ἑταιρεία (1888), sincc 1899 styled Σιναία Ἀκαδήμεια.

Central and South America.—Bogotá, *Soc. de Naturalistas Colombianos, Contribuciones* (1860, &c.). Bucnos Aires, *Soc. Cientifica Argentina* (1872), *Anales* (1876, &c.). Caracas, *Soc. de Ciencias, Boletin* (1868, &c.). Cordova, *Acad. Nacion., Bol.* (1874, &c.). Guatcmala, *Instit. Nac.*; *Academia* (1888); *Ateneo* (1903), 7 sections. Havana, *Acad. de Cien.* (1861), *Anales* (1864, &c.). La Paz (Bolivia), *Academia Aymara* (1901). Mexico, *Soc. Mex. de Hist. Nat.* (1868), *La Naturaleza* (1869, &c.); *Academia Mejicana* (1875), *Memorias* (1876–1896); *Acad. Mex. de Sciencias* (1894), *Anales.* Rio de Janeiro, *Palestra Cient., Archivos* (1858, &c.). Santiago, *Soc. de Hist. Nat.*

Japan.—Tokyo, *Asiatic Soc. of Japan* (1872), *Trans.* (1874, &c.); *Deutsche Ges. f. Natur- u. Völkerskunde Ostasiens* (1873), *Mitteil.* (1873, &c.).

II. Mathematics

Many of the general scientific societies (see class i.) have mathematical and other special sections. Among defunct English societies may be mentioned the *Mathematical Society*, which used to meet in Spitalfields (1717–1845) and possessed a library, and the *Cambridge Analytical Society*, which published *Memoirs* (4to, 1813). The *London Mathematical Society* (1865, incorporated 1894), *Proc.* (1865, &c.), the *Mathematical Assn.* (1871), *Gazette*, and the *Edinburgh Mathematical Society* (1883), *Proc.* (1883, &c.), are still flourishing.

United States: *American Mathem. Soc.* (reorganized 1894), meets at Columbia University, *Bull.* and *Trans.* France: Paris, *Soc. Mathém. de France* (1872), *Bull.* (1873, &c.). Germany and Austria-Hungary: Berlin, *Mathem. Ver. der Univ.* (1861), *Ber.* (1876, &c.); *Berliner Mathem. Ges.* (1901), *Sitzungsber.* Budapest, *Mathematikai és Phys. Társulat* (1891). Cassel, *Geometer-Ver.* (1878). Dresden, *Ver. praktisch. Geometer* (1854), *Jahresber.* (1861, &c.). Essen, *Feldmesser-Ver.* (1869). Göttingen, *Mathemat. Ver.* (1868). Hamburg, *Mathemat. Ges.* (1690), *Mittheil.* Königsberg, *Geometer-Ver.* (1872). Leipzig, *Deutsche Mathem. Vereinigung* (1891), founded at Halle, *Jahresb.* Strassburg, *Geometer-Ver.* (1881). Stuttgart, *Deutscher Geometer-Ver., Zeitschrift* (1872, &c.). Holland: Amsterdam, *Genootschap der Mathemat. Wetensch. Kunstoeffinengen* (1782–1788), *Mengelwerken* (1793–1816), and *Archief* (1856, &c.). Spain: Valladolid, *R. Acad. de Matematicas* (1803, &c.), now dissolved. Russia: Kazan, *Phys. and Math. Soc.* (1880). Moscow, *Mathemat. Soc.* (1867). Japan: *Mathemat. Soc. of Tokyo, Journal* (1878, &c.).

III. Astronomy

The first *International Astronomical Congress* met at Heidelberg in 1863, and the first international conference for photographing the heavens at Paris in 1887. The *Royal Astronomical Society* was founded in 1820 under the title of *Astronomical Society of London*, and was incorporated on the 7th of March 1831. It occupies rooms in Burlington House, and has published *Memoirs* (1882, &c.) and *Monthly Notices* (1831, &c.). There are also the *British Astronom. Soc.* in London, and societies at Bristol (1869), *Reports*; Leeds (1859), Manchester and Liverpool (1881); Toronto, *Roy. Astr. Soc. of Canada* (1890), *Trans.* (1890), *Proc.* (1902), *Journal* (1907, &c.); Madison, *Astronomical and Astrophysical Soc. of America* (1899); San Francisco, *Astr. Soc. of the Pacific* (1889), *Publ.*; Paris, *Soc. Astr.* (1887), *Bull.*; Berlin, *Kgl. Astr. Recheninstitut* (1897); Leipzig, *Astronomische Ges.* (1863), *Publ.* (1865, &c.) and *Vierteljahrsschrift* (1866, &c.); Turin, *Soc. Astr. Ital.* (1906), *Revista*; Brussels, *Soc. Belge d'Astr., de Météorol. et de Physique du Globe* (1893), *Bull. mens.*; Antwerp, *Soc. d'Astr.* (1905), *Gazette*; St Petersburg, *Russ. Astr. Soc.* (1890), *Investija* (1896, &c.); and Mexico, *Soc. Astr.* (1902), *Boletin* (1902, &c.).

IV. Physics

The first *International Electrical Congress* was held at Paris in 1881. The *Physical Society of London* was founded in 1874 and registered under the Companies Act; it publishes *Proceedings* (1874, &c.). The *London Electrical Society* (1836) did useful work in its *Transactions* (1837–1840, vol. i.) and *Proceedings* (1841–1843). Sir W. Siemens was one of the originators of the *Institution of Electrical Engineers* (founded in 1871 and registered in 1883). It owns the Ronalds library of electricity and magnetism and publishes a *Journal.* In London there are also the *Faraday Soc.* (1903), *Trans.* and *Proc.*, and the *Optical Soc.*

United States: Philadelphia, *Amer. Electrochem. Soc., Trans.* (1902). New York, *Nat. Elec. Light Assn.* (1885), *Proc.* (1885); *Amer. Phys. Soc.* (1899), *Bull.* (1899) included since 1903 in the *Physical Review*; *Am. Inst. of Electr. Eng.* (1884), *Trans.* and *Proc.* France: Cambrai, *Soc. Magnétique, Archives* (1845). Paris, *Soc. Franç. de Phys.* (recognized as of public utility on the 15th of January 1881), *Bull.*; *Soc. Int. des Électriciens* (1883), *Bull.* Germany: Berlin, *Physikalische Ges.* (1843), *Fortschritte der Physik* (1847, &c.); *Elektrotechnisch. Ver.* (1879), *Ztschr.* (1880, &c.). Breslau, *Physikalischer Ver.* Frankfort, *Physikalischer Ver.* (1824), *Jahresber.* (1841, &c.), and *Wetterkarten* daily. Königsberg, *Phys.-ökon. Ges.* (1790), *Schr.* (1859, &c.). Italy: Naples, *R. Accad. delle Sc. Fis. e Matem., Rendic.* (1856, &c.) and *Atti* (1863). Rome, *Soc. degli Spettroscopisti Ital.*; *Soc. Ital. di Fisica* (1897), *Il nuovo cimento.* Holland: Rotterdam, *Bataafsch. Genootschap van Proefondervindelijke wijsbegeerte, Verhandel.* (1774, &c.). Russia: St Petersburg, *Russ. Physico-Chemical Soc., Journal* (1869, &c.).

V. Chemistry

Pharmaceutical societies are placed in class xiii. (Medicine, &c.). The *Chemical Society of London* for the promotion of chemistry and the sciences immediately connected with it was instituted on the 23rd of February 1841; a charter of incorporation was obtained in 1848. It publishes *Memoirs* (1843, &c.), and *Quarterly Journal* (1849, &c.). Chemistry and its connexion with the arts, and agricultural and technical matters, form the subjects of the *Institute of Chemistry*, founded on the 2nd of September 1877 and incorporated in 1885. It publishes *Proc.* The *Society of Chemical Industry* (1881) was incorporated in 1907, and publishes a *Journal.* The *Society of Public Analysts* publishes the *Analyst* (1876, &c.). The oldest of the numerous photographic societies is the *Royal Photographic Society of Great Britain* (1853), which issues a *Journal.* The *Royal College of Chemistry* was founded in July 1845, and had a brief career; it published *Reports* (1849). The *Cavendish Society* was instituted in 1846 for the publication and translation of works and papers on chemistry. It came to an end in 1872 after having issued 30 vols.

United States: New York, *American Chemical Soc.* (1876), *Proc.* (1876), *Journ.* (1879) and *Abstracts* (1907). Washington, *Chem. Soc.* (1884), *Bull.* now the *Journal of the Amer. Chem. Soc.* France: Paris, *Soc. Chimique* (1857), *Bull.* (1861, &c.). Germany: Berlin, *Deutsche Chemische Ges.* (1867), *Ber.* (1868, &c.); *Deutsche Bunsen-Ges.* (1894), *Ztschr. für Elektrochemie*; *Verein Chem. Reichsanstalt.* Frankfort, *Chem. Ges.* Jena, *Chem. Laborat.* Leipzig, *Ver. Deutscher Chem.* (1888), based on the *Ver. Analyt. Chemiker, Ztschr.* (1900, &c.). Würzburg, *Chemische Ges.* (1872). Bohemia: Prague, *Spolek Chemiku Ceskych* or *Soc. of Bohemian Chemists, Zpravy* or *Trans.* (1872, &c.). Belgium: Brussels, *Soc. Chim. de Belgique*, formerly *Assoc. Belge des Chimistes* (1887), *Bull.*

VI. Geology, Mineralogy and Palaeontology

The first *International Congress of Geology* took place at Bologna in 1878. The *Geological Society of London*, founded in 1807 and incorporated in 1826, is the largest and most important in Great Britain; it has published *Proceedings* (1834–1846), *Transactions* (1811, &c.), and a *Quarterly Journal* (1845, &c.). The *Geologists' Association* was instituted in 1858, and issues *Proceedings* (1859, &c.). The *Mineralogical Society* (1876) has united with it the *Crystallogical Society*; it issues the *Mineralogical Magazine* (1876, &c.). The *Palaeontographical Society* was founded in 1847 for the delineation and description of British fossils; it issues *Publications* (4to, 1847, &c.). The *Royal Geological Society of Cornwall* (1814) devotes special attention to the mining interests of the county, and publishes *Transactions* (1818, &c.). It holds its meetings at Penzance. The *Geological Society of Edinburgh* (1834) issues *Transactions* (1870, &c.). The *Royal Geological Society of Ireland* (1832) principally studied the geology of the country. It published a *Journal* (1837, &c.). There are also the *Geological Associations* of Leeds (1874) and Liverpool (1880), *Trans.*, and the *Societies* of Liverpool (1859), *Proc.*, and Manchester (1838), *Trans.*

South Africa: Johannesburg, *Geol. Soc. of S. A.* (1895), *Trans.* (1895, &c.). United States: Louisville, Ky., *Ohio Falls Geolog. Soc.* San Francisco, *California State Geolog. Soc.* (1876). New York, *Geol. Soc. of Amer.* (1888), *Bull.* Washington, *Geol. Soc. of Washington* (1893). France: Lille, *Soc. Géol. du Nord* (1870), *Annales* (1874, &c.). Havre, *Soc. Géol. de Normandie, Bull.* (1873, &c.). Paris, *Soc. Géol. de France* (1830, recognized 1832), awards the Prix Viquesnel (£40) every three years, *Bull.* (1830, &c.) and *Mém.* (1833, &c.); *Soc. Franç. de Minéralogie* (1878, recognized 1886), formerly *Soc. Minéral. de France, Bull.* (1879, &c.). Saint-Étienne, *Soc. d'Ind. Minérale* (1855), *Bull.* (1855, &c.). Germany and Austria-Hungary: Berlin, *Deutsche Geol. Ges.* (1848), *Ztschr.* (1849, &c.), *Monatsberichte* (1903, &c.); Budapest, *Magyarhoni Földtani Tarsulat*

1850) or *Hungarian Geolog. Soc.* (1850), *Földtani Közlöny*. Brünn, *Wernerscher Geol. Ver., Jahresber.* Darmstadt, *Mittelrheinischer Geolog. Ver.* (1851), *Mittheil.* (1855, &c.). Dresden, *Gebirgs-Ver.* (1855). SWITZERLAND: *Schweizerische Geolog. Ges.* (1882), section of *Allg. Schw. Ges.* Zürich, *Schweiz. Paläontol. Ges.* (1874), *Abhandl.* (1875, &c.). ITALY: Rome, *Soc. Sismol. Ital.* (1895), *Boll.*; *Soc. Geol. Ital.*, founded at the second *International Geological Congress*. BELGIUM: Antwerp, *Soc. Paléontol.* (1857), *Bull.* Brussels, *Soc. Belge de Géol., de Paléont. et d'Hydrol.* (1887), *Bull., Mém.* and *Proc.-verb.* Charleroi, *Soc. Paléontol.* (1863), *Documents et Rapports* (1866, &c.). Liége, *Soc. Géol. de Belgique, Annales* (1874, &c.). SWEDEN: Stockholm, *Geologiska Förening* (1871), *Förhändlingar* (1872, &c.). RUSSIA: St Petersburg, *Imp. Russian Mineralog. Soc.* (1816), *Trans.*, pub. in Russian, German and French (1830, &c.). ARGENTINE REPUBLIC: Buenos Aires, *Soc. Paleontol.* MEXICO: Mexico, *Soc. Geol. Mexicana* (1904), *Bol.*

VII. Meteorology

The *International Meteorological Congress* first met at Brussels in 1853. The *Royal Meteorological Society* (1850) of London was incorporated in 1866; its organ is *Quarterly Journal* (1873, &c.). To this must be added the *British Rainfall Society*; the *Scottish Meteorological Society* holds its meetings at Edinburgh and issues a *Journal* (1866, &c.). Port Louis (Mauritius), *Meteorolog. Soc., Trans.* (1853, &c.). Paris, *Soc. Météorolog. de France* (1852), *Annuaire* (1853, &c.) and *Nouvelles Météorolog.* (1868, &c.). Berlin, *Deutsche Meteor. Ges.* (1883), *Ztschr.* Hamburg, *Deutsche Meteorolog. Ges.* (1883), *Ztschr.* Magdeburg, *Ver. f. landwirtsch. Wetterkunde* (1881). Meissen, *Gesellsch., Isis.* Vienna, *Österreich. Ges. f. Meteorol., Zeitschrift* (1866, &c.). Modena, *Soc. Meteorolog. Ital.* Gothenburg, *Kungl. Vetenskaps- och Vitterhets-samhället* (1778), *Handligar.*

VIII. Microscopy

The *Royal Microscopical Society* (1839, incorporated 1866), with *Transactions* (1842–1868) and *Journal* (1869, &c.); the *Quekett Microscopical Club* (1865), with a *Journal* (1868, &c.); and the *Postal Microscopic Society* (1873), also with a *Journal*, are located in London. There are suburban societies at Ealing (1877), Hackney (1877), Highbury (1878), South London (1871), and Sydenham (1871). In the provinces may be mentioned those at Bath (1859), Birmingham (1880), Bolton (1877), Bradford (1882), Bristol (1843), Carlisle, Chichester (*Trans.*), Croydon (1870, *Trans.*), Dublin (1840), East Kent (1858), Edinburgh, Liverpool (1868, *Trans.*), Manchester (1880), and Sheffield (1877). In the United States the *State Microscop. Soc. of Illinois* publishes the *Lens* (1872, &c.); Buffalo, *Amer. Soc. of Microscopists*; New York, *Microscop. Soc.*; Urbana, *Amer. Micros. Soc.* (1878), *Proc.* (1879), *Trans.* (1895, &c.). Brussels, *Soc. Belge de Microscop.* (1875), *Proc.-verb.* (1875, &c.) and *Annales* (1876, &c.). Berlin, *Ges. f. Mikroskop.* (1877), *Ztschr.* (1878, &c.). Hanover, *Ges. f. Mikroskop.* (1879), *Jahresber.*

IX. Botany and Horticulture

Linnaean societies, which usually deal with both zoology and botany, are placed in the general class (No. i.). The *Congrès International d'Horticulture* first met at Brussels in 1864, and the *Congrès International de Botanique* at Amsterdam in 1865. The *Royal Botanic Society of London* (incorporated 1839) has gardens in the inner circle of Regent's Park, and issues a *Quarterly Record* (1880, &c.). The *Royal Horticultural Society* (established in 1804, incorporated in 1809) has gardens at Chiswick, and publishes a *Journal* (1846, &c.). The chief provincial societies are—Aberdeen, *North of Scotl. Hortic. Assoc.* (1879), *Trans.* Arbroath, *Hortic. Assoc.* (1880). Birmingham, *Bot. and Hortic. Soc.* (1829), gardens. Dublin, *Roy. Hortic. Soc.* (1830). Liverpool, *Bot. Soc.* (1906). Edinburgh, *Bot. Soc.* (1836), *Proc.* (1837, &c.) and *Trans.* (1844, &c.); *Royal Scottish Arboric. Soc.* (1854), *Trans.*; *Cryptogamic Soc. of Scotl.* (1875). CANADA: Kingston, *Bot. Soc. of Canada* (1860), *Annals* (1861, &c.).

UNITED STATES: Baltimore, *Bot. Soc. Amer.* (1894). Boston, *Hortic. Soc.* (1829). New York, *Torrey Botanical Club* (1858, reorganized 1867), *Bull.* (1870, &c.). San Francisco, *State Hortic. Soc.* Washington, *Bot. Soc. of Wash.* (1901). FRANCE: Beauvais, *Soc. d'Hortic. et de Bot.* (1864), *Bull.* (1864, &c.). Bordeaux, *Soc. d'Hortic.* Chartres, *Soc. d'Hortic. et de Viticulture.* Chauny, *Soc. de Pomologie*, Dijon, *Soc. d'Hortic.* Fontenay-le-Comte, *Soc. d'Hortic.* Lisieux, *Soc. d'Hortic. et de Bot.* (1866), *Bull.* (1866, &c.). Lyons, *Soc. d'Hortic. Pratique* (1844), *Bull.* (1844, &c.) *Soc. Bot.* (1872), *Annales* (1872, &c.); *Soc. Pomologique* (1872), *Bull.* (1872, &c.). Moulins, *Soc. d'Hortic.* Nîmes, *Soc. d'Hortic.* Niort, *Soc. d'Hortic.* Orleans, *Soc. d'Hortic.* (1839), *Bull.* (1841, &c.). Paris, *Soc. Nat. d'Hortic.*, (1827; declared of public utility 1852), *Journal*; *Soc. Bot. de France*, *Bull.* (1854), *Mém.* (1905, &c.). Rouen, *Soc. Centr. d'Hortic.* Saint Germain-en-Laye, *Soc. d'Hortic.* Senlis, *Soc. d'Hortic.* Troyes, *Soc. d'Hortic.* Versailles, *Soc. d'Hortic.* GERMANY and AUSTRIA-HUNGARY: Berlin, *Bot. Ver.* (1859), *Verhandl.* (1859, &c.); *Deutsche Bot. Ges.* (1882), *Berichte* (1883, &c.); *Horticult. Ges.* Blankenburg, *Bot. Ver.* Bonn, *Bot. Ver.* (1818), *Jahresber.* (1837, &c.). Danzig, *Westpr. Bot.-zool. Ver.* (1878). *Jahresber.* Dresden, "*Flora*": *Ges. für Bot. u. Gartenbau* (1826), *Sitzungsber.* Erfurt, *Gartenbau Ver.* Frankfort, *Gartenbau Ges.* Freiburg, *Bot. Ver.* Görlitz, *Gartenbau Ver.* Gotha, *Thüringer Gartenbau Ver.* Klagenfurt, *Kärntnerische Gartenbau Ges.* Landshut, *Bot. Ver.* (1864). Meiningen, *Ver. f. Pomologie u. Gartenbau.* Munich, *Bayerische Botanische Ges., Mittheil.* (1890). Ratisbon, *K. Bayerische Bot. Ges.* (1790), *Flora* (1818, &c.) and *Repertorium* (1864, &c.). Reutlingen, *Pomolog. Inst.* Sondershausen, *Bot. Ver.* Stuttgart, *Gartenbau Ges., Flora.* Vienna, *K. k. Gartenbau Ges.*; *Botan. Ver., Verhandl.* (1851, &c.). Weimar, *Ver. f. Blumistik.* Würzburg, *Bot. Inst., Arbeiten* (1871, &c.). ITALY: Milan, *Soc. Crittog. Ital., Atti* (1878, &c.). BELGIUM: Antwerp, *Soc. Roy. d'Hortic. et d'Agr.*; *Soc. Phytologique, Annales* (1864, &c.). Bruges, *Soc. d'Hortic. et de la Bot.* Brussels, *Soc. Roy. de Bot.* with *State Botanical Garden* (1862), *Bull.* (1862, &c.); *Soc. Roy. de Flore*; *Soc. Centr. d'Arboric., Annales.* Liége, *Soc. Roy. d'Hortic.* HOLLAND: Ghent, *Kruidkundig Genootschap Dodonaea* (1887), *Tijdschr.* Leiden, *Nederl. Bot. Vereen.* Luxembourg, *Soc. de Bot., Recueil* (1874, &c.). Nimeguen, *Nederl. Bot. Vereen, Archief* (1871, &c.). DENMARK: Copenhagen, *Bot. Forening, Tidsskrift* (1866, &c.).

X. Zoology

Societies dealing with natural history in general, or zoology and botany together, come under class i. The first *International Ornithological Congress* was held at St Petersburg. The *Zoological Society of London* (1826, incorporated 1829) is famous for its collection of animals at Regent's Park. It publishes *Proceedings* (8vo, 1830, &c.) and *Transactions* (4to, 1835, &c.). In London also are the *British Ornithologists' Union* (1859); *Entomological Society of London* (1833), *Trans.* (1834, &c.); *National Fish Culture Association* (1883); *Malacolog. Soc.* (1893). The *Concholog. Soc.* (1876) meets at Manchester, which also has an *Entomolog. Soc.* (1902). The *Marine Biological Association of Great Britain* (1884), for the study of marine food fishes and shell-fish, has a laboratory at Plymouth. The *Royal Zoological Society of Ireland* (1831) has gardens in the Phoenix Park. There is the *British Beekeepers' Association* (1874). AUSTRALIA and NEW ZEALAND: Auckland, *Acclimatisation Soc.* Brisbane, *Acclimat. Soc.* Christchurch, *Acclimat. Soc.* Melbourne, *Zoolog. and Acclimat. Soc. of Victoria, Report* (1861, &c.); *Australasian Ornitho. Union* (1896), *The Emu.* Sydney, *Acclimat. Soc. of N.S. Wales, Report* (1862, &c.); *Entomolog. Soc. of N.S.W., Trans.* (1863, &c.). Wellington, *Westland Nat. and Acclimat. Soc.* AFRICA: Cape Town, *Zoolog. Soc.* Port Louis (Mauritius), *Soc. d'Acclimat.* CANADA: Toronto, *Entomolog. Soc.*; *Beekeepers' Assoc.*

UNITED STATES: Cambridge, *Nuttall Ornitholog. Club, Bull.* (1876) and *Memoirs* (1886); and *Entomolog. Club, Psyche* (1874, &c.); *Amer. Soc. Zoologists* (1890). *Cincinnati Soc. of Nat. Hist.* (1870), *Journs.* (1879). *Illinois Central Beekeepers' Association.* New York, *Entom. Soc.* (1892), *Journal*; *N. Y. Zoolog. Soc.* (1895), *Rep. Guide Book.* Pasadena, *Cooper Ornith. Club* (1893) founded at San Jose, *Pacific Avifauna* (1900, &c.), *The Condor* (1899, &c.). Philadelphia, *Zoolog. Soc.* (1859), *Report* (1874, &c.); and *Amer. Entomolog. Soc.* (1859), *Proc.* (1861–1866), *Trans.* (1867, &c.). Washington, *Amer. Ornith. Union* (1883), *The Auk* (1884, &c.); *Biolog. Soc.* (1901); and *Entomolog. Soc.* (1884), *Proc.* FRANCE: Alais, *Soc. Séricicole, Bull.* (1876, &c.). Amiens, *Soc. d'Apiculture, Bull.* (1875, &c.). Clermont, *Soc. Centr. d'Apicult., Bull.* (1875, &c.). Lille, *Inst. Zoolog. à Wimereux, Travaux* (1877, &c.). Paris, *Soc. Nat. d'Acclimat.* (1854), *Bull. Mensuel* (1854, &c.) and *Chron. Bimens.* (1875, &c.); *Soc. Zoolog. de France, Bull.* (1876, &c.); *Soc. Entomolog. de France, Annales* (1832); and *Soc. de Biologie* (1848), *Comptes Rendus* (1849, &c.). GERMANY and AUSTRIA-HUNGARY: *Wanderversammlung Deutscher Bienenzüchter, Verhandl.* (1856, &c.). XI. ANTHROPOLOGY

The *Congrès International d'Anthropologie et d'Archéologie Préhistoriques* held its first meeting at Neuchâtel in 1866; it issues *Comptes rendus* (1866, &c.). The *Royal Anthropological Institute of Great Britain and Ireland* was founded in 1871 upon the *Ethnological Society* (1843), which published a *Journal* (1848–1856) and *Transactions* (1859–1869), and the *Anthropological Society* (1863), which issued *Memoirs* (1863–1869) and the *Anthropological Review* (1864–1870). The *Institute* brings out a *Journal* (1871, &c.).

SPAIN: Madrid, *Soc. Antropolog. Esp., Revista* (1875, &c.). RUSSIA: St Petersburg, *Russian Anthrop. Soc.* (1888), *Protokotyzasedanij* (1901, &c.).

XII. SOCIOLOGY (Economic Science, Statistics, Law, Education)

The international societies are the *Association Internationale pour le Progrès des Sciences Sociales* and the *Congrès International de Statistique* which first met at Brussels in 1853. Both have issued *Comptes rendus.* The *Congrès International de Bienfaisance* may be traced to a suggestion at the *Congrès Pénitentiaire* held at Frankfort in 1847. The first meeting took place at Brussels in 1856. The *Inst. Internat. de Sociologie* (1893) has its headquarters at Paris. The *National Association for the Promotion of Social Science* (1857) had united with it in 1864 the *Society for Promoting the Amendment of the Law.* It held a yearly migratory meeting, and published *Transactions* (1858, &c.) and *Social Science* (1866, &c.). The *Sociological Soc.,* the *Eugenics Education Soc.* and the *Roy. Economic Soc.* are established in London. The *Royal Statistical Society* (1834), incorporated 1887, publishes a *Journal* (1839, &c.); *Cobden Club* (1866), for the diffusion of the political and economical principles with which Cobden's name is associated, has issued a variety of publications; *Institute of Actuaries* (incorp. 1884); *Institute of Chartered Accountants* (1880); *Institute of Bankers* (1879); the *Society of Incorporated Accountants and Auditors* (1885), and the *Chartered Institute of Secretaries,* also meet in London. There are also the *Manchester Statistical Society* (1833), with *Transactions*; the *Faculty of Actuaries in Scotland* and the *Scottish Society of Economists* (1897), both meeting at Edinburgh; and the *Statistical and Social Inquiry Society of Ireland* (1847), with a *Journal,* at Dublin. After the INNS OF COURT (*q.v.*), the most important of British legal societies is the *Law Society* (1827, incorporated 1832, reincorp. 1845); it began courses of lectures for students in 1833, and was appointed registrar of solicitors ten years later, and obtained supplementary charters in 1845 and 1878. This society has a fine building, with library and examination hall in Chancery Lane, London. There are over 70 provincial societies, most of them being associated with the parent body. The *Verulam Society* (1846) published a few books and came to an end. The *Selden Society,* established in 1887 for the promotion of the study of the history of law, prints ancient records. The headquarters of the *Association for the Reform and Codification of the Law of Nations* are in London, but conferences are held in various continental towns. The *Chartered Institute of Patent Agents* (founded 1882, incorporated 1891) issues *Transactions.* The *Juridical Society of Edinburgh* (1773) published five editions of a *Complete System of Conveyancing.* The *Ascham Society* was founded in 1879 for the improvement of educational methods; and the *Society for the Development of the Science of Education* (1875) issued *Transactions.*

RUSSIA: Moscow, *Juridical Soc.* St Petersburg, *Pedagogical Soc.* EGYPT: Cairo, *Bureau Central de Statist.* HAVANA (Cuba), *Soc. Econ. de Amigos del Pais* (1792), *Memorias.* JAPAN: Tokio, *Statist. Soc.*

XIII. MEDICINE AND SURGERY

The first meeting of the *Congrès Médical International* was held at Paris in 1867; a *Bulletin* has been issued annually since 1868, and the first Surgical Congress was held in Paris in 1885. The first *Congrès Périodique Internat. d'Ophthalmologie* took place at Brussels in 1857. The Royal Colleges of Physicians and of Surgeons of London, Edinburgh and Dublin do not come within our scope. The *Medical Society of London* (1773) is the oldest in the metropolis; it has issued *Memoirs* (1787–1805), *Transactions* (1810, &c.), and *Proceedings* (1872, &c.). The *Royal Society of Medicine* was formed, by Royal charter, in 1907 by the amalgamation of the following societies: *Roy. Med. and Chir. Soc.* (1805), *Pathological Soc.* (1846), *Epidemiological Soc.* (1850), *Odontol. Soc. of Gt. Britain* (1856), *Obstetrical Soc.* (1858), *Clinical Soc.* (1867), *Dermatological Soc. of London* (1882), *British Gynaecological Soc.* (1884), *Neurolog. Soc.* (1886), *British Laryngol. Rhinol. and Otological Assoc.* (1888), *Laryngol. Soc.* (1893), *Soc. of Anaesthetists* (1893), *Dermatol. Soc. of Gt. Brit. and Ireland* (1894), *Otological Soc.* (1899), *Soc. for Study of Diseases in Children* (1900), *British Electro-therapeutic Soc.* (1901) and the *Therapeutical Soc.* (1902). Most of these societies have separate *Transactions* or *Proceedings.* Other London societies (past and present) include the *Abernethian Society* (1795), which issues *Proceedings*; *British Dental Association* (1880), with a *Journal* (1880, &c.); *British Homoeopathic Association* (1859), with *Annals* (1860, &c.); *British Medical Association* (1832), which has more than forty home and colonial branches, and publishes *British Medical Journal* (1857, &c.); *Hahnemann Publishing Society* (1852), *Materia Medica* (1852, &c.); *Harveian Society* (1831); *Hunterian Society* (1819), *Trans.*; *Lister Institute* (incorp. 1891); *Medico-Legal Soc. of London, Trans.*;

Medico-Psycholog. Assn. of Gt. Britain and Ireland (1841, incorp. 1895); *New Sydenham Society* (1858), which published *Biennial Retrospect* (1867, &c.), and translations and reprints of books and papers of value, succeeded the old *Sydenham Society* (1844–1858), which issued 40 vols.; *Ophthalmological Society* (1880), *Trans.*; *Pharmaceutical Society* (1841), with museum, *Pharmaceutical Journal* (1842, &c.); *Physiological Association* (1876), *Journ. of Physiology* (1878, &c.); *Röntgen Soc., Journal*; *Royal Institute of Public Health* (1886, incorp. 1892), *Journ. Royal Sanitary Institute* (1876, incorp. 1888), the council of which appoints examiners, directs Parkes Museum, founded in 1876 in memory of Dr E. A. Parkes; *Society of Medical Officers of Health* (1856), *Trans.* and *Public Health*; *Soc. of Public Analysts*, *Analyst*. The provincial societies are very numerous and include: Bradford, *Med. Chir. Soc.* (1863); Bristol, *Med. Chir. Soc.*; Cardiff, *Med. Soc.* (1870); Liverpool, *Sch. of Tropical Med.* (1898, incorp. 1905), *Memoirs*; Manchester, *Med. Soc.* (1848); Newcastle-upon-Tyne, *North. and Durham Med. Soc.* (1848). Dublin, *Roy. Acad. of Med. in Ireland* (1882), *Trans.* (1883, &c.); *Pharmac. Soc. of Ireland* (1875). Edinburgh, *Roy. Med. Soc.* (1737; charter 1778); *Harveian Soc.* (1752); *Medico-Chirurg. Soc.* (1821), *Trans.* (1824, &c.); and *Obstetrical Soc.* (1840). Aberdeen, *Med. Chir. Soc.* (1789). Glasgow, *Medico-Chirurg. Soc.* (1866), based upon *Med. Soc.* and *Med.-Chirurg. Soc.* (both 1814), joined by *Path. Soc.* in 1907.

AUSTRALIA: Melbourne, *Med. Soc. of Victoria*, *Austr. Med. Journ.* (1856, &c.). CANADA: Montreal, *Union Méd. du Canada*, *Revue* (1872, &c.); *Canada Med. Assoc.*, *Trans.* (1877, &c.). INDIA: Bombay, *Med. and Physical Soc.*, *Trans.* (1838, &c.). Calcutta, *Med. Soc.*, *Trans.* (1883, &c.).

UNITED STATES: *Amer. Pub. Health Assoc.*, *Reports* (1873, &c.); *Amer. Dental Assoc.*, *Trans.* (1860, &c.); and *Amer. Inst. of Homoeop.*, *Trans.* (1878, &c.). The headquarters of the *American Medical Association* (1847) are at Chicago; it publishes a *Journal*. The *American Surgical Association* (1880) unites at Washington every third year with the *Congress of American Physicians and Surgeons*. The State medical associations include those of Alabama, *Trans.* (1869, &c.); Georgia, *Trans.* (1873, &c.); Maine, *Trans.* (1853, &c.); Missouri, *Trans.* (1851, &c.); and South Carolina, *Trans.* The State medical societies include those of Arkansas, *Trans.* (1877, &c.); California, *Trans.* (1870, &c.); Illinois, *Trans.* (1851, &c.); Kansas, *Trans.* (1867, &c.); Michigan, *Trans.* (1869, &c.); Minnesota, *Trans.* (1874, &c.); Nebraska, *Trans.* (1869, &c.); New Jersey, *Trans.* (1859, &c.); Pennsylvania, *Trans.* (1851, &c.); Rhode Island, *Trans.* (1877, &c.); Texas, *Trans.* (1874); and Wisconsin, *Trans.* (1880, &c.). To these have to be added the following town associations. Albany, *Med. Soc.*, *Journal* (1807, &c.). Baltimore, *Med. and Chirurg. Faculty of Maryland*, *Trans.* (1856, &c.). Boston, *Amer. Gynaecolog. Soc.*, *Trans.* (1876, &c.); *Mass. Medico-Legal Soc.*, *Trans.* (1878, &c.). Denver, *Acad. of Med.* (1903). New York, *Acad. of Med.*, *Trans.* (1847, &c.) and *Bull.* (1860, &c.); *Med. Soc.*, *Trans.* (1815, &c.); *Medico-Chirurg. Soc.*, *Trans.* (1878, &c.); *Amer. Surg. Assoc.*, *Trans.* (1883, &c.); *Medico-Legal Soc.*, *Sanitarian* (1873, &c.); *Amer. Ophthalmolog. Soc.*, *Trans.* (1865, &c.); *Path. Soc.* (1844), *Trans.* (1875–1879), *Proc.* (1888, &c.). Philadelphia, *Med. Soc.*, *Trans.* (1850, &c.); *Obstet. Soc.*, *Trans.* (1869, &c.); *Amer. Pharm. Assoc.*, *Proc.*; *Patholog. Soc.* (1857), *Trans.* (1897, &c.); *Coll. of Physicians* (1787); *Amer. Soc. of Tropical Med.* (1903). Richmond, *Med. Soc.*, *Trans.* (1871, &c.).

XIV. ENGINEERING AND ARCHITECTURE

The principal English society dealing with mechanical science is the *Institution of Civil Engineers* (established in 1818, incorporated in 1828), which publishes *Transactions* (4to, 1836–1842) and *Minutes of Proceedings* (8vo, 1837, &c.). George Stephenson was the first president of the *Institution of Mechanical Engineers*, which was founded at Birmingham in 1847, removed to London in 1877, and registered under the Companies Act in 1878. It holds migratory meetings and publishes *Proceedings*. The *Society of Engineers* (1854), with *Transactions* (1861, &c.); the *Civil and Mechanical Engineers' Society* (1859); the *Iron and Steel Institute* (1869, incorp. 1899), with *Journal* and *Mem.*; the *Surveyors' Institution* (1868, incorporated in 1881), which publishes *Transactions* and holds professional examinations; the *Aeronautical Society of Great Britain* (1866), the *Institution of Electrical Engineers* (1871, incorp. 1883), *Journal*; the *Institution of Mining Engineers* has associated with it many branch institutions in the provinces, *Journal*; the *Institute of Gas Engineers* (1863); the *Illuminating Engineers' Soc.* (1909); the *Institute of Metals*; and the *Instn. of Mining and Metallurgy*, meet in London. There are institutions in the provinces at Bradford, Bristol, Cardiff (1857, incorp. in 1881), Chesterfield (1871), Dublin (1835, incorp. in 1857), Glasgow (1857, with *Transactions*), Liverpool (1875), Middlesbrough (1864), Newcastle-upon-Tyne (1852, incorp. in 1876, with *Transactions*), Nottingham (1871), Dudley (1866), and Belfast (1892).

The leading architectural society is the *Royal Institute of British Architects*, founded in 1834, incorporated in 1837, and granted new charters in 1887 and 1908. It appoints examining professional boards and publishes *Transactions* (1836; 1879, &c.) and *Proceedings* (1879, &c.). There are also the associations of Birmingham (1873), Edinburgh (1850), Exeter (1843), Glasgow (1868), Leeds (1876), Leicestershire (1855), Liverpool (1848), Manchester (1875), Newcastle-upon-Tyne, and the societies of Manchester (1865) and Oxford (1837).

The *Architectural Association* of London publishes a *Sketch Book* (1870, &c.). The *Architectural Publishing Society* (1848) has published *Essays* (1848–1852), and since 1852 has been bringing out a *Dictionary of Architecture*. There is also a *Society of Architects* (1884, incorp. 1893). The *Roy. Inst. of Architects of Ireland* meets in Dublin and publishes a *Journal*.

UNITED STATES: New York, *Inst. of Mining Engineers. Amer. Soc. of Civ. Eng. Trans.*; *Amer. Soc. of Mech. Eng., Trans.*; *Amer. Inst. of Min. Eng.*; *Amer. XV. NAVAL AND MILITARY SCIENCE

The *Royal United Service Institution*, first known as the *Naval and Military Library and Museum* (1831), took the name of the *United Service Institution* in 1839, and was incorporated in 1860; its professional museum is housed in the banqueting hall at Whitehall; it publishes a *Journal* (1857, &c.). The *Institution of Naval Architects* (1860) publishes *Transactions* (4to, 1860, &c.). The *Royal Artillery Institution* (1838), which issues *Minutes of Proceedings* (1858, &c.), is at Woolwich, and the *Royal Engineers' Institute* (1875), which issues *Royal Engineers' Professional Papers*, at Chatham. The *Navy Records Soc.* (1893) publishes works connected with the history of the British Navy. CANADA: Toronto, *Military Inst.* INDIA: Simla, *United Service Institution.*

UNITED STATES: New York, *Military Service Inst.* (1878), *Journal* (1879, &c.); *Soc. of Naval Architects and Marine Eng., Proc.* Annapolis, *U.S. Naval Institute* (1873), *Proc.* FRANCE: Paris, *Réunion des Officiers*, now *Cercle Militaire, Bull.* (1871, &c.). GERMANY and AUSTRIA-HUNGARY: Munich, *Militär. Ges.* (1868), *Jahrbuch.* (1871, &c.). Vienna, *K. k. Milit.-Geogr. Inst., Arbeiten* (1871, &c.). HOLLAND: Utrecht, *Vereen. tot Verspreiding van Kennis aangaande s'Lands Verdediging, Jaarsverslag* (1872, &c.) and *Werken.* NORWAY: Christiania, *Militaere Samfund, Nordsk Milit. Tidsskrift* (1848, &c.). DENMARK: Copenhagen, *Krigsvidenskabelige Selskab, Milit. Tidsskrift* (1872, &c.).

XVI. AGRICULTURE AND TRADES

The *Royal Agricultural Society of England* began as the *English Agricultural Society* in 1838 and was incorporated in 1840. It holds annually one migratory meeting in some part of England or Wales and meetings in London, where are its headquarters; it publishes a *Journal* (1840, &c.). Among provincial agricultural societies and associations may be mentioned—Aberdeen, *Roy. Northern Agr. Soc.* (1843). Arbroath, *Angus Agr. Assoc.* Banbury (1834). Basingstoke, *Roy. Counties Agr. Soc.* (1859). Bath, *Bath and West of Engl. Soc. and Southern Counties Assoc.* (founded in 1777, enlarged in 1852, and reorganized in 1866), *Letters and Papers* (1780–1816) and *Journal* (1852, &c.). Belfast, *Chemico-Agr. Soc. of Ulster* (1845), *Proc.*; *N.E. Agr. Assoc. of Ireland.* Birkenhead, *Wirral and Birkenhead Agr. Soc.* (1842). Brecknock (1855). Carluke (1833). Chelmsford, *Essex Agr. Soc.* (1858). Chertsey (1833). Doncaster (1872). Dublin, *Roy. Agr. Soc. of Ireland* (1841). Edinburgh, *Highland and Agr. Soc. of Scotland* (1784, incorporated in 1787), *Trans.* (1799, &c.). Halifax (1839, enlarged in 1858). Ipswich, *Suffolk Agr. Assoc.* (1831). Otley, *Wharfedale Agr. Soc.* Paisley, *Renfrewshire Agr. Soc.* (1802). Warwick. Worcester (1838). AFRICA: Cape Town, *Agr. Soc.* AUSTRALIA: Sydney, *Agr. Soc. of N. S. Wales.* BRITISH GUIANA: Georgetown, *Roy. Agr. and Commercial Soc.* CANADA: Montreal, *Soc. d'Agr.* INDIA: Calcutta, *Agr. and Hortic. Soc., Journ.* (1842, &c.).

UNITED STATES: There were agricultural societies formed at Philadelphia and in South Carolina in 1785. *The New York Soc. for the Promotion of Agriculture, Arts and Manufactures* (1791), the *Massachusetts Soc. for Prom. Agriculture* (1792), and *Columbian Agr. Soc.* (1809), issued publications. Albany, *State Agr. Soc.* (1832), *The Cultivator* and *Journal.* Atlanta, *State Agr. Soc.* Boston, *Inst. of Technology.* Hoboken, *Stevens Inst. of Technol.* Madison, *State Agr. Soc.. Trans.* (1852, &c.). Sacramento, *Soc. of Agr. and Hortic.* San Francisco, *Agr. and Hort. Soc.* Troy, *Rensselaer Polytechnic Inst.* (1824). *Worcester Polytechnic Institute* (1865), *Journ.* (1897, &c.).

FRANCE: Algiers, *Soc. d'Agr.* (1840), *Bull.* Agen, *Soc. d'Agr.* (1776), *Rec.* (1800, &c.). Amiens, *Soc. Industrielle* (1861), *Bull.* Angers, *Soc. d'Agr.* (1799), formerly *Acad. d'Angers, Proc.-verb.* (1846–1854), *Mém.* (1831, &c.), *Documents* (1896, &c.). Bordeaux, *Soc. d'Agr.* Boulogne, *Soc. d'Agr.* Caen, *Assoc. Normande pour l'Agr., l'Industrie*, &c. (1831), *Annuaire* (1835, &c.); *Soc. d'Agr. et de Commerce* (1762), *Mém.* (1853–1858) and *Bull.* (1827, &c.). Châlons-sur-Marne, *Soc. d'Agr.*, &c. (1750), *Comptes rendus* (1807–1855), *Mém.* (1855, &c.). Douai, *Soc. d'Agr.*, &c. (1799), *Souv.* (1861–1885), *Mém.* (1826, &c.). Elbeuf, *Soc. Industr.* (1858), *Bull.* Grenoble, *Soc. d'Agr. et d'Hortic.* (1835), *Sud-Est* (1855, &c.). Le Mans, *Soc. du Matériel Agr.* (1857), *Bull.* Lyons, *Soc. des Sc. Industr.* (1862), *Annales.* Montpellier, *Soc. d'Agr.* (1799), *Bull.* (1808, &c.). Nancy, *Soc. Centr. d'Agr.* Paris, *Soc. Nat. d'Agr. de France* (1761; reconstructed in 1878 with a view of advising Government on agricultural matters), *Mém.* and *Bull.* Perpignan, *Soc. Agr. Scientifique et Litt.* (1833), *Bull.* (1834, &c.). Reims, *Soc. Industr.* (1833), *Bull.* (1858, &c.). Rouen, *Soc. Industr.* (1872), *Bull.*; *Soc. XVII. LITERATURE, HISTORY AND ARCHAEOLOGY

The *Congrès International des Orientalistes* first met at Paris in 1873. The *Congrès Bibliographique International* held its first meeting in 1878, and the *Congrès des Américanistes* its first meeting in 1875. The first *Internat. Conference of Librarians* took place in London in 1877. Congresses of Archivists, Librarians and Bibliographers were held at Brussels in 1910. The *Royal Society of Literature* (1823, incorporated in 1825) with *Transactions* (4to, 1829–1839; 8vo, 1843, &c.), and the *Royal Asiatic Society* (1823), with *Journal* (1834, &c.), have their headquarters in London, as well as the following literary societies, all of which issue publications: *Aristotelian* (1879), *Ballad* (1868), *Chaucer* (1868), *Dante* (1881), *Early English Text* (1864), *East India Association* (1866), *Hellenic Studies* (1879), *Incorp. Soc. of Authors* (1884), *Institute of Journalists*, *Irish Lit.*, *Japan* (1892), *Library Association* (1877), *Library Assistants* (1895), *Malone* (1906), *Oriental Translation Fund* (1828), *Pali Text* (1882), *Philological* (1842), *Roxburghe Club* (1812), *Shorthand*, *Viking Club* (1892), *Wyclif* (1882). The *Lancashire and Cheshire Historic Society* (1848), at Liverpool, the *Manchester Literary Club*, with

Transactions and Papers (1874, &c.), and the *Manx Society* (1858), at Douglas, may also be mentioned. In Glasgow are the *Ballad Club* (1876), and the *Scottish Soc. of Lit. and Art* (1886), and in Dublin the *Nat. Lit. Soc. of Ireland* (1892).

The oldest and most important society in England dealing with history and archaeology is the *Society of Antiquaries of London*, which enthusiasts trace to an association founded by Archbishop Parker in 1572. The meetings were not publicly recommenced until 1707; the present body was incorporated in 1751; it publishes *Vetera Monumenta* (fol., 1747, &c.), *Archaeologia* (4to, 1770, &c.), and *Proceedings* (8vo, 1849, &c.). The *Royal Archaeological Institute* (1843), issuing the *Archaeological Journal* (1845, &c.); the *British Archaeological Association* (1843), with *Journal* (1846, &c.); the *Royal Numismatic Society* (1836), issuing the *Numismatic Chronicle* (1838, &c.); and the *Royal Historical Society* (1868), publishing *Transactions*, and the works of the *Camden Society* (1838), belong to London, as well as the following societies, all of which issue publications: *Bibliographical* (1892), *British School at Athens*, *British School at Rome*, *British Record* (1888, incorp. 1893, incl. *Index Soc.* 1878). *Canterbury and York Catholic Record* (1904), *Egypt Expl. Fund* (1883), *Genealog. and Biogr.*, *Cymmrodorion* (1751–1773, revived in 1820), *Dilettanti* (1734), *Folk Lore* (1879), *Harleian* (1869), *Huguenot* (1885), *London and Middlesex Archaeol.* (1855), *London Topogr. Soc.*, *Middlesex County Records* (1884), *Palaeographical*, *Palestine Expl. Fund*, *Parish Registers*, *Pipe Roll* (1883), *Soc. Bibl. Archaeol.* (1870), *Soc. for Prot. Anc. Buildings* (1877). Outside London are the *Roy. Soc. of Antiquaries of Ireland* founded in 1849 as the *Kilkenny Arch. Soc.*, changed to *Roy. Hist. and Arch. Assn.* in 1869 and to present title in 1890; the *Society of Antiquaries of Scotland* (1780), at Edinburgh, and the *Irish Archaeological and Celtic Society*, at Dublin. Among others are—Aberdeen, *New Spalding Club* (1886); *Bedfordshire Archaeological and Architect. Soc.* (1844); Bristol, *Bristol and Gloucester Arch. Soc.* (1876); *Cambrian Arch. Assoc.* (1846); *Cambridge Antiq. Soc.* (1840); Carlisle, *Cumb. and Westm. Antiq. and Arch. Soc.* (1866); Devizes, *Wiltshire Arch. and Nat. H. Soc.* (1853); Durham, *Surtees Soc.* (1834); Colchester, *Essex Arch. Soc.* (1852); Edinburgh, *Bibliogr. Soc.* (1890), *Scottish Hist.* (1886); Exeter, *Diocesan Arch. Soc.* (1841); *Glasgow Arch. Soc.* (1856); *Kent Arch. Soc.* (1857); *Lanc. and Cheshire Antiq. Soc.* (1883). Leeds *Thoresby Soc.* (1889); Manchester, *Chetham Soc.* (1843); *Newcastle-on-Tyne Soc. of Antiq.* (1813); Norwich, *Norfolk and Norwich Arch. Soc.* (1846); Oxford, *Architect. and Hist. Soc.* (1839), and *Hist. Soc.* (1884); *Purbeck Soc.*; Reading, *Berkshire Arch. and Architectural Soc.* (1871); *Surrey Arch. Soc.*; *Sussex Arch. Soc.* (1846); Welshpool, *Powys Land Club* (1867); and *Yorkshire Arch. Soc.* (1863).

Canada: Halifax, *Nova Scotia Hist. Soc.* (1878), *Coll.* Montreal, *Soc. Hist.*, *Mém.* (1859, &c.); *Numism. and Antiq. Soc.* (1872), *Journ.* (1872, &c.). Quebec, *Lit. and Hist. Soc.* (1824), *Trans.* (1837, &c.). Toronto, *Ontario Hist. Soc.* (1888, 1898), *Rep.*; *Lit. and Hist. Soc.* China: Hong-Kong, *Roy. Asiatic Soc.* Shanghai, *Roy. Asiatic Soc.*, *Journ.* (1858, &c.). India: Bombay, *Roy. Asiatic Soc.* (Branch) (1804), *Journal* (1844, &c.). XVIII. GEOGRAPHY

The *Congrès International pour les Progrès des Sciences Géographiques* first met in 1871. The *Royal Geographical Society of London*, founded in 1830, had joined to it in the following year the *African Association* (1788), the successor of the *Saturday Club*; the *Palestine Association* (1805) became merged with it in 1834. It publishes *Journal* (1832, &c.) and *Proceedings* (1857, &c.). The *Hakluyt Society* (1846) has printed more than 136 vols. of rare voyages and travels. The *Alpine Club* (1858), whose publications are *Peaks, Passes and Glaciers* (1859–1862) and *Journal* (1863, &c.), meets in London. The *Royal Scottish Geographical Society* (1884) has its centre at Edinburgh, and issues the *Scottish Geographical Magazine.* Liverpool, Tyneside and Manchester have also *Geographical Societies.* AUSTRALIA: Adelaide, *R. Geogr. Soc. of Australasia* (1885), *Proc.* Brisbane, *R. Geogr. Soc. of Australasia* (1885). Melbourne, *Roy. Geogr. Soc. of Australasia* (1883). Sydney, *Geogr. Inst.* CANADA: Quebec, *Geogr. Soc.* INDIA: Bombay, *Geogr. Soc.*, *Trans.* (1836, &c.). EGYPT: Cairo, *Soc. Khédiviale de Géogr.* (1875), *Bull.* (1876, &c.).

UNITED STATES: Baltimore, *Geogr. Soc.* (1902). Chicago, *Geogr. Soc.* (1894). Hamilton, *Assoc. of Amer. Geogr.* (1904). New York, *Amer. Geogr. Soc.* (1852), *Bull.* (1852–1857), *Journ.* later *Bull.* (1859, &c.), and *Proc.* (1862–1865). Philadelphia, *Geogr. Soc.* (1891). San Francisco, *Geogr. Soc.* (1891), *Bull.* Washington, *Nat. Geogr. Soc.* (1852), *Magazine* (1888). FRANCE: Algiers, *Soc. Géogr.* (1896), *Bull.* Bordeaux, *Soc. de Géogr. Commerciale* (1874), *Bull.* Dijon, *Soc. Bourg. de Géogr. et d'Hist.* (1881), *Mém.* (1884, &c.). Lyons, *Soc. de Géogr.* (1873), *Bull* Marseilles, *Soc. de Géogr.* (1876), *Bull.* Montpellier, *Soc. Languedocienne de Géogr.* (1878), *Bull.* Nancy, *Soc. de Géogr.* (1878). *Bull.* Paris, *Soc. de Géogr.* (1821; 1827), *Bull.* Toulouse, *Soc. de Géogr.* (1882), *Bull.* GERMANY and AUSTRIA-HUNGARY: *D. Geogr.* (1888), *Bol.* Mexico, *Soc. de Geogr. y Estad.*, *Bol.* (1833, &c.). Rio de Janeiro, *Soc. de Geogr.*

BIBLIOGRAPHY.—The *Catal. of Printed Books in the British Museum* (1841), folio, s.v. "Academies," contains a list of all the publications of societies at that time in the museum. This has been rearranged and greatly enlarged as *Academies* (1885–1886), 5 parts folio, with *Suppl.* (1900–1903). *Smithsonian Instn. International Exchange List* (1908); B. Quaritch, *List of Learned Societies* (Odd Vols.) (1886). S. H. Scudder, *Cat. of Scientific Serials* (1633–1876); *Camb.* (U.S.) (1879), 8vo. For general indexes see J. D. Reuss, *Repertorium* (1801–1821), 16 vols., *Roy. Soc. Cat of Sc. Papers* (1867–1902); *Societatum Litterae*, *Verzeichniss* (1887–1900, 14 vols.). For list of indexes to transactions, &c., see A. Stein, *Manuel de Bibliographie générale* (1897), p. 642, &c. *Minerva* (Strassb. Trübner), from 1891 on, is most useful for all the chief existing societies in the world. British societies are now well represented in the *Year Book of the Scientific and Learned Societies of Great Brit. and Ireland* (1884, &c.). See also Hume's *Learned Societies and Printing Clubs of the U.K.* (1853, 8vo); E. Mailly, *Inst. Sc. de la Grande-Bret.* (1861–1867, 6 pts.); H. G. SOCIETY ISLANDS (French *Archipel de la Société*). an archipelago of the Pacific Ocean, in the eastern part of Polynesia, between 16° and 18° S., 148° and 155° W., with a total land area of 637 sq. m.. belonging to France. (For map, see PACIFIC OCEAN.) The principal island is Tahiti (*q.v.*). Part of the archipelago was discovered by Pedro Fernandez Quiros in 1607. In 1767 Samuel Wallis re-discovered it, and named it King George's Island. In 1768 Louis de Bougainville visited Tahiti, claimed it as French, and named it La Nouvelle Cythère. On the 12th of April 1769 the British expedition to observe the transit of Venus, under the naval command of James Cook, arrived at Tahiti. On this first voyage (he subsequently revisited the islands twice) he named the Leeward group of islands Society in honour of the Royal Society, at the instigation of which the expedition had been sent; Tahiti and the adjacent islands he called Georgian, but the first name was subsequently adopted for the whole group. In 1772 and 1774 the islands were visited by a Spanish government expedition, and some attempt was made at colonization. In 1788 Lieutenant Bligh of the "Bounty" spent some time at Tahiti, to which island the historical interest now passes.

The archipelago is divided into two groups—the Leeward (*Îles sous le Vent*) and the Windward Islands (*Îles du Vent*)—by a clear channel of 60 m. in breadth. The Leeward Islands are Tubai or Motuiti, a small uninhabited lagoon island, the most northern of the group; Marua or Maupiti—"Double Mountain," the most western; Bola-Bola or Bora-Bora; Huaheine; Raiatea or Ulietea (Spanish Princessa), the largest island of this cluster, and Tahaa, which approach each other very closely, and are encircled by one reef. To the west lie the small groups of coral islets—Mopiha (Lord Howe), Ura (Scilly) and Bellingshausen (discovered by Otto von Kotzebue, 1824). To the Windward Islands belong Tapamanu or Majaiti (Wallis's Sir Charles Saunders's Island and Spanish Pelada); Moorea or Eimeo (Wallis's Duke of York Island and Spanish San Domingo); Tahiti—Cook's Otaheite (probably Quiros's Sagittaria; Wallis's King George's Island, Bougainville's Nouvelle Cythère and Spanish Isla d'Amat); Tetuaroa—"The Distant Sea" (? Quiros's Fugitiva; Bougainville's Umaitia and Spanish Tres Hermanos); and Maitea (? Quiros's La Dezana, Wallis's Osnaburg Island, Bougainville's Boudoir and Pic de la Boudeuse and Spanish Cristoval), the most eastern and southern of the archipelago. Tetuaroa and Tubai, besides the three western Leeward Isles, are coral atolls. The length of the Tetuaroa reef ring is about six miles; it bears twelve palm-covered islets, of which several are inhabited, and has one narrow boat-passage leading into the lagoon. With the exception just named, the islands, which agree very closely in geological structure, are mountainous, and present, perhaps, the most wonderful example of volcanic rocks to be found on the globe. They are formed of trachyte, dolerite and basalt. There are raised coral beds high up the mountains, and lava occurs in a variety of forms, even in solid flows; but all active volcanic agency has so long ceased that the craters have been almost entirely obliterated by denudation. Hot springs are unknown, and earthquakes are slight and rare. Nevertheless, under some of these flows remains of plants and insects of species now living in the islands have been found—a proof that the formation as well as the denudation of the country is, geologically speaking, recent. In profile the islands are rugged and elevated (7349 ft. in Tahiti, Moorea 4045 ft., Raiatea 3389, Bola-Bola 2165). A mountain, usually with very steep peaks, forms the centre, if not the whole island; on all sides steep ridges descend to the sea, or, as is oftener the case, to a considerable belt of flat land. These mountains, excepting some stony crags and cliffs, are clothed with dense forest, the soil being exceptionally fertile. All voyagers agree that for varied beauty of form and colour the Society Islands are unsurpassed in the Pacific. Innumerable rills gather in lovely streams, and, after heavy rains, torrents precipitate themselves in grand cascades from the mountain cliffs—a feature so striking as to have attracted the attention of all voyagers, from Wallis downwards. Round most of the islands there is a luxuriant coral growth; but, as the reefs lie at no great distance, and follow the line of the coast, the inter-island channels are comparatively safe. Maitea, which rises from the sea as an exceedingly abrupt cone, and Tapamanu, appear to be the only islands without almost completely encircling barrier-reefs. The coasts are fairly indented, and, protected by these reefs, which often support a chain of green islets, afford many good harbours and safe anchorages. In this respect the Society Islands have the advantage of many Polynesian islands.

The populations of the chief islands are: Tahiti 10,300, Moorea 1600, Raiatea and Tahaa 2300, Huaheine 1300, Bola-Bola 800; and that of the whole archipelago is about 18,500.

SOCINUS, the latinized form of the Italian Sozini, Sozzini or Soccini, a name born by two Italian theologians.

1 LELIO FRANCESCO MARIA SOZINI (1525–1562) was born at Siena on the 29th of January 1525. His family descended from Sozzo, a banker at Percena, whose second son, Mino Sozzi, settled as a notary at Siena in 1304. Mino Sozzi's grandson, Sozzino (d. 1403), was ancestor of a line of patrician jurists and canonists, Mariano Sozzini senior (1397–1467) being the first and the most famous, and traditionally regarded as the first freethinker in the family. Lelio (who spells his surname Sozini, latinizing it Sozinus) was the sixth son of Mariano Sozzini junior (1482–1556) by his wife Camilla Salvetti, and was educated as a jurist under his father's eye at Bologna. He told Melanchthon that his desire to reach the *fontes juris* led him to Biblical research, and hence to rejection of "the idolatry of Rome" He gained some knowledge of Hebrew and Arabic (to Bibliander he gave a manuscript of the Korān) as well as Greek, but was never a laborious student. His father supplied him with means, and on coming of age he repaired to Venice, the headquarters of the evangelical movement in Italy. A tradition, first published by Sand in 1678, amplified by subsequent writers, makes him a leading spirit in alleged theological conferences at Vicenza, about 1546; the whole account (abounding in anachronisms, including the story of Sozini's flight) must be rejected as fabulous. At this period the standpoint of Sozini was that of evangelical reform; he exhibits a singular union of enthusiastic piety with subtle theological speculation. At Chiavenna in 1547 he came under the influence of Camillo of Sicily, a gentle mystic, surnamed Renato, whose teaching at many points resembled that of the early Quakers. Pursuing his religious travels, his family name and his personal charm ensured him a welcome in Switzerland, France, England and Holland. Returning to Switzerland at the close of 1548, with commendatory letters to the Swiss churches from Nicolas Meyer, envoy from Wittenberg to Italy, we find him (1549–1550) at Geneva, Basel (with Sebastian Münster) and Zürich (lodging with Pellican). He is next at Wittenberg (July 1550 to June 1551), first as Melanchthon's guest, then with Johann Forster for improvement of his Hebrew. From Wittenberg he returned to Zürich (end of 1551), after visiting Prague, Vienna and Cracow. Political events drew him back to Italy in June 1552; two visits to Siena (where freedom of speech was for the moment possible, owing to the shaking off of the Spanish yoke) brought him into fruitful contact with his young nephew Fausto. He was at Padua (not Geneva, as is often said) at the date of Servetus's execution (Oct. 27, 1553). Thence he made his way to Basel (January 1554), Geneva (April) and Zürich (May), where he took up his abode.

Calvin, like Melanchthon, received Sozini with open arms. Melanchthon (though a phrase in one of his letters has been strangely misconstrued) never regarded him with theological suspicion. To Calvin's keen glance Sozini's over-speculative tendency and the genuineness of his religious nature were equally apparent. A passage often quoted (apart from the context) in one of Calvin's letters (January 1, 1552) has been viewed as a rapture of amicable intercourse; but, while more than once uneasy apprehensions arose in Calvin's mind, there was no breach of correspondence or of kindliness. Of all the Reformers, Bullinger was Sozini's closest intimate, his warmest and wisest friend. Sozini's theological difficulties turned on the resurrection of the body, predestination, the ground of salvation (on these points he corresponded with Calvin), the doctrinal basis of the original gospel (his queries to Bullinger), the nature of repentance (to Rudolph Gualther), the sacraments (to Johann Wolff). It was the fate of Servetus that directed his mind to the problem of the Trinity. At Geneva (April 1554) he made incautious remarks on the common doctrine, emphasized in a subsequent letter to Martinengo, the Italian pastor. Bullinger, at the instance of correspondents (including Calvin), questioned Sozini as to his faith, and received from him an explicitly orthodox confession (reduced to writing on the 15th of July 1555) with a frank reservation of the right of further inquiry. A month before this Sozini had been sent with Martino Muralto to Basel, to secure Ochino as pastor of the Italian church at Zürich; and it is clear that in their subsequent intercourse the minds of Sozini and Ochino (a thinker of the same type as Camillo, with finer dialectic skill) acted powerfully on each other in the radical discussion of theological problems. In 1556 by the death of his father (who left him nothing by will), Sozini was involved in pecuniary anxieties. With influential introductions (one from Calvin) he visited in 1558 the courts of Vienna and Cracow to obtain support for an appeal to the reigning duke at Florence for the realization of his own and the family estates. Curiously enough Melanchthon's letter introducing Sozini to Maximilian II. invokes as an historic parallel the hospitable reception rendered by the emperor Constans to Athanasius, when he fled from Egypt to Trèves. Well received out of Italy, Sozini could do nothing at home, and apparently did not proceed beyond Venice. The Inquisition had its eye on the family; his brother Cornelio was imprisoned at Rome; his brothers Celso and Camillo and his nephew Fausto were "reputati Luterani," and Camillo had fled from Siena. In August 1559 Sozini returned to Zürich, where his brief career was closed by his death on the 14th of May 1562, at his lodging in the house of Hans Wyss, silk-weaver. No authentic portrait of him exists; alleged likenesses on medals, &c., are spurious. The news of his uncle's death reached Fausto at Lyons through Antonio Maria Besozzo. Repairing to Zürich Fausto got his uncle's few papers, comprising very little connected writing but a good many notes. Fausto has so often been treated as a plagiarist from Lelio that it may be well to state that his indebtedness, somewhat over-estimated by himself, was twofold: (1) He derived from Lelio in conversation (1552–1553) the germ of his theory of salvation; (2) Lelio's paraphrase (1561) of ἀρχή in John i. 1 as "the beginning of the gospel" gave Fausto an exegetical hint for the construction of his Christology. Apart from these suggestions, Fausto owed nothing to Lelio, save a curiously far-fetched interpretation of John viii. 58 and the stimulus of his pure character and shining qualities. The two men were of contrasted types. Lelio, impulsive and inquisitive, was in quest of the spiritual ground of religious truths; the drier mind of Fausto sought in external authority a basis for the ethical teaching of Christianity.

Sozini's extant writings are: (1) *De sacramentis dissertatio* (1560), four parts, and (2) *De resurrectione* (a fragment); these were first printed in *F. et L. Socini, item E. Soneri tractatus* (Amsterdam, 1654). To these may be added his *Confession* (1555), printed in Hottinger, *Hist. eccles. N.T.* ix. 16, 5 (1667); and about twenty-four letters, not collected, but may be found dispersed, and more or less correctly given in Illgen, in Trechsel, in the *Corpus reformatorum* edition of Calvin's works, and in E. Burnat, *L. Socin* (1894); the handwriting of the originals is exceedingly crabbed. Sand adds a *Rhapsodia in Esaiam prophetam*, of which nothing is known. Beza suspected that Sozini had a hand in the *De haereticis, an sint persequendi* (1553); and to him has also been assigned the *Contra libellum Calvini* (1554); both are the work of Castellio, and there is no ground for attributing any part of them to Sozini. Beza also assigned to him (in 1567) an anonymous *Explicatio* (1562) of the proem of St John's Gospel, which was the work of Fausto; this error, adopted by Zanchi, has been a chief source of the misconception which treats Lelio as a heresiarch. In Franc Guinio's *Defensio cath. doct. de S. Trin.* (1590–1591) is an anonymous *enumeratio* of motives for professing the doctrine of the Trinity, by some ascribed to Lelio; by others, with somewhat more probability, to Fausto.

For the life of L. Sozini the best guide is Trechsel, *Die prot. antitrin. vor F. Socin*, vol. ii. (1844); but there are valuable materials in Illgen, *Vita L. Socini* (1814), and especially *Symbolae ad vitam et doctrinam L. Soc.*, &c. (1826). R. Wallace, *Antitrin. biog.* (1850), gives the ordinary Unitarian view, relying on Bock, Da Porta and Lubieniecki. See also *Theological Review* (July 1879), and Bonet-Maury's *Early Sources of Eng. Unit. Christ.* (trans. E. P. Hall, 1884). Use has been made above of unprinted sources.

II. Fausto Paolo Sozzini (1539–1604) was born at Siena on the 5th of December 1539, the only son of Alessandro Sozzini, "princeps subtilitatum," by Agnese, daughter of Borghese Petrucci, a descendant of Pandolfo Petrucci, the Cromwell of Siena. Unlike his uncle Lelio, Fausto spells his surname Sozzini, latinizing it Socinus. His father died in 1541, in his thirty-second year. Fausto had no regular education, being brought up at home with his sister Fillide, and spent his youth in desultory reading at Scopeto, the family country-seat. To the able women of his family he owed the strong moral impress which marked him through life; his early intellectual stimulus came from his uncle Celso, a nominal Catholic, but an *esprit fort*, founder of the short-lived *Accademia dei Sizienti* (1554), of which young Fausto was a member. In 1556 his grandfather's will, leaving him one-fourth of the family estates, made him independent. Next year he entered the *Accademia degli intronati*, the centre of intellectual life in Siena, taking the academic name "Il Frastagliato," his badge *Un mare turbato da venti*, his motto *Turbant sed extollunt*. About this time Panzirolo (*De claris legg. interpp.*, first published 1637) describes him as a young man of fine talent, with promise of a legal career; but he despised the law, preferring to write sonnets. In 1558–1559 the suspicion of Lutheranism fell on him in common with his uncles Celso and Camillo. Coming of age (1561) he went to Lyons, probably engaging in mercantile business; he revisited Italy after his uncle Lelio's death; we find him in 1562 on the roll of the Italian church at Geneva; there is no trace of any relations with Calvin; to Lyons he returned next year. The evangelical position was not radical enough for him. In his *Explicatio* (1562) of the proem to St John's Gospel he already attributes to our Lord an official, not an essential, deity; a letter of 1563 rejects the natural immortality of man (a position subsequently developed in his disputation with Pucci). Towards the end of 1563 he returned to Italy, conforming to the Catholic Church, and for twelve years, as his unpublished letters show, was in the service of Isabella de Medici, daughter of the grand-duke Cosimo of Tuscany (not, as Przypkowski says, in the service of the grand-duke). This portion of his life he regarded as wasted; till 1567 he gave some attention to legal duties, and at the instance of "a great personage" wrote (1570) his treatise *De auctoritate s. scripturae*. In 1571 he was in Rome, probably with his patroness. He left Italy at the end of 1575, and after Isabella's death (strangled by her husband in 1576) he declined the overtures of her brother Francesco, now grand-duke, who pressed him to return. Francesco was doubtless aware of the motive which led Sozzini to quit Italy; there is every reason to believe Przypkowski's statement that the grand-duke agreed to secure to him the income of his property so long as he published nothing in his own name. Sozzini now fixed himself at Basel, gave himself to close study of the Bible, began translating the Psalms into Italian verse, and, in spite of increasing deafness, became a centre of theological debates. His discussion with Jacques Couet on the doctrine of salvation issued in a treatise *De Jesu Christo servatore* (finished July 12, 1578), the circulation of which in manuscript commended him to the notice of Giorgio Blandrata (*q.v.*), court physician in Poland and Transylvania, and ecclesiastical wire puller in the interests of heterodoxy.

Transylvania had for a short time (1559–1571) enjoyed full religious liberty under an anti-Trinitarian prince, John Sigismund. The existing ruler, Christopher Báthori, favoured the Jesuits; it was now Blandrata's object to limit the "Judaic" tendencies of the eloquent anti-Trinitarian bishop, Francis Dávid (1510–1579), with whom he had previously co-operated. A charge of the gravest sort against Blandrata's morals had destroyed his influence with Dávid. Hence he called in Sozzini to reason with Dávid, who had renounced the worship of Christ. In Sozzini's scheme of doctrine, terms in themselves orthodox were employed in a heretical sense. Thus Christ was God, though in nature purely human, namely as *un Dio subalterno, al quale in un dato tempo il Dio supremo cedette il governo del mondo* (Cantù). In matter of worship Sozzini distinguished between *adoratio Christi*, the homage of the heart, imperative on all Christians, and *invocatio Christi*, the direct address of prayer, which was simply permissive (Blandrata would have made it imperative); though in Sozzini's view, prayer, to whomsoever addressed, was received by Christ as mediator, for transmission to the father. In November 1578 Sozzini reached Kolozsvár (Klausenburg) from Poland, and did his best, during a visit of four months and a half under Dávid's roof, to argue him into this modified doctrine of invocation. The upshot was that Dávid from the pulpit exerted all his powers in denouncing all cultus of Christ. His civil trial followed, on a charge of innovation. Sozzini hurried back to Poland before it began. He cannot be accused of complicity with what he calls the rage of Blandrata; he was no party to Dávid's incarceration at Déva, where the old man miserably perished in less than three months. He was willing that Dávid should be prohibited from preaching pending the decision of a general synod; and his references to the case show that (as in the later instances of Jacobo Paleology, Christian Franken and Martin Seidel) theological aversions, though they never made him uncivil, froze up his native kindness and blinded his perceptions of character. Blandrata ultimately conformed to the Catholic Church; hence Sozzini's laudatory dedication to him (1584) of his *De Jesu Christi natura*, in reply to the Calvinist Andrew Wolan, though printed in his works, was not used. The remainder (1579–1604) of Sozzini's life was spent in Poland. Excluded at first by his views on baptism (which he regarded as applicable only to Gentile converts) from the Minor or anti-Trinitarian Church (largely anabaptist), he acquired by degrees a predominant influence in its synods. He converted the Arians from their avowal of our Lord's pre-existence, and from their rejection of the *invocatio Christi*; he repressed the semi-Judaizers whom he failed to convince. Through correspondence with friends he directed also the policy of the anti-Trinitarian Church of Transylvania. Forced to leave Cracow in 1583, he found a home with a Polish noble, Christopher Morsztyn, whose daughter Elizabeth he married (1586). She died in the following year, a few months after the birth of a daughter, Agnese (1587–1654), afterwards the wife of Stanislas Wiszowaty, and the progenitress of numerous descendants. In 1587 the grand-duke Francesco died; to this event Sozzini's biographers attribute the loss of his Italian property, but his unpublished letters show that he was on good terms with the new grand-duke, Ferdinando. Family disputes had arisen respecting the interpretation of his grandfather's will; in October 1590 the holy office at Siena disinherited him, allowing him a pension, apparently never paid. Failure of supplies from Italy dissolved the compact under which his writings were to remain anonymous, and he began to publish in his own name. The consequence was that in 1598 a mob expelled him from Cracow, wrecking his house, and grossly ill-using his person. Friends gave him a ready welcome at Luslawice, 30 miles east from Cracow; and here, having long been troubled with colic and the stone, he died on the 4th of March 1604. A limestone block with illegible inscriptions marks his grave.[1] His engraved portrait is prefixed to his works (the original is not extant); an oil-painting, formerly at Siena, cannot be considered authentic.

Sozzini's works, edited by his grandson Andrew Wiszowaty and the learned printer F. Kuyper, are contained in two closely printed folios (Amsterdam, 1668). They rank as the first two volumes of the *Bibliotheca fratrum polonorum*, though the works of Crell and Schlichting were the first of the series to be printed. They include all Sozzini's extant theological writings, except his essay on predestination (in which he denies that God foresees the actions of free agents) prefixed to Castellio's *Dialogi IV.* (1578, reprinted 1613) and his revision of a school manual *Instrumentum doctrinarum aristotelicum* (1586). His pseudonyms, easily interpreted, were Felix Turpio Urbevetanus, Prosper Dysidaeus, Gratianus Prosper and Gratianus Turpio Gerapolensis (=Senensis). Some of his early verse is in Ferentilli's *Scielta di stanze di diversi autori toscani* (1579, 1594); other specimens are given in Cantù and in the *Athenaeum* (Aug. 11, 1877); more are preserved at Siena. Sozzini considered that his ablest work was his *Contra atheos*, which perished in the riot at Cracow (1598). Later he began, but left incomplete, more than one work designed to exhibit his system as a whole. His reputation as a thinker must rest upon (1) his *De auctoritate s. scripturae* (1570) and (2) his *De Jesu Christo servatore* (1578). The former was first published (Seville, 1588) by Lopez, a Jesuit, who claimed it as his own, but prefixed a preface maintaining (contrary to a fundamental position of Sozzini) that man by nature has a knowledge of God. A French version (1592) was approved by the ministers of Basel; the English translation by Edward Coombe (1731) was undertaken in consequence of the commendation in a charge (1728) by Bishop Smalbroke, who observes that Grotius had borrowed from it in his *De veritate Christ. rel.* In small compass it anticipates the historical argument of the "credibility" writers; in trying it by modern tests, it should be remembered that Sozzini, regarding it (1581) as not adequately meeting the cardinal difficulties attending the proof of the Christian religion, began to reconstruct its positions in his *Lectiones sacrae* (unfinished). His treatise on the Saviour renders a real service to theology, placing orthodoxy and heresy in new relations of fundamental antagonism, and narrowing the conflict to the main personal benefit of religion. Of the person of Christ in this treatise he says nothing; its one topic is the work of Christ, which in his view operates upon man alone; the theological sagacity of Sozzini may be measured by the persistency with which this idea tends to recur. Though his name has been attached to a school of opinion, he disclaimed the rôle of a heresiarch, and declined to give his unreserved adhesion to any one sect. His confidence in the conclusions of his own mind has earned him the repute of a dogmatist; but it was his constant aim to reduce and simplify the fundamentals of Christianity. Not without some ground does the memorial tablet at Siena (inscription by Brigidi, 1879) characterize him as vindicator of human reason against the supernatural. Of his non-theological doctrines the most important is his assertion of the unlawfulness not only of war, but of the taking of human life in any circumstances. Hence the comparative mildness of his proposals for dealing with religious and anti-religious offenders, though it cannot be said that he had grasped the complete theory of toleration. Hence, too, his contention that magisterial office is unlawful for a Christian.

Authorities.—For the biography of Sozzini the best materials are his letters; a collection is in his works; others are given by Cantù; more are preserved at Siena and Florence; his correspondence is open and frank, never sparing his weak points. The earliest life (prefixed to his works) is by S. Przypkowski (1636); in English, by J. Bidle (1653). This is the foundation of the article by Bayle, the *Memoirs* by J. Toulmin (1777), and the article by R. Wallace (*Antitrin. Biog.*, 1850). Cantù's sketch in *Gli Eretici d'Italia* (1866) gives a genealogy of the Sozzini (needing revision). The best defence of Sozzini in his relations with Dávid is by James Yates (*Christ. Pioneer*, Feb. 1834); a less favourable view is taken by Dávid's Hungarian biographer Elek Jakab (*Dávid F. Emléke*, 1879). Of his system—best known through the *Racovian Catechism* (1605, planned by Sozzini and carried out by others, principally Valentine Schmalz); in English, by T. Rees (1818)—there is a special study by O. Fock, *Der Socinianismus* (1847). See also *The Sozzini and their School*, by A. Gordon (*Theol. Rev.*, 1879; cf. *Christian Life*, Aug. 25, 1883). Use has been made above of unpublished papers in the archives of Florence, with others in the archives, communal library and collection of Padre Toti at Siena. (A. Go.*)

SOCIOLOGY, a science which in the most inclusive sense may be defined as that of human society, in the same manner that Biology may be taken to imply the science of life. The word *Sociologie* was first used by Comte in 1839 as an equivalent of the expression, social physics, previously in use, and was introduced, he said, to describe by a single term that part of natural philosophy which relates to the positive study of the fundamental laws of social phenomena. The word is a hybrid, compounded from both Latin and Greek terms. It is now generally accepted in international usage; none of the terms, such as politics, political science, social economy, social philosophy and social science which have been suggested instead of it having succeeded in taking its place.

There has been in the past a certain hesitation, especially in England, to admit sociology as the title of a particular science in itself until it was made clear what the subject must be considered to cover. In certain quarters sociology is still often incorrectly spoken of as if it implied the practical equivalent of the science of politics. Henry Sidgwick, for instance, considered the word as usually employed in this sense, and while he himself recognized that sociology must have a wider scope than politics, he thought that in practice "the difference between the two subjects is not indeed great" (*Elements of Politics*). This view of sociology, which at one time widely prevailed, dates from an earlier period of knowledge. The difference between sociology and the science of politics is wide and is due to fundamental causes, a true perception of which is essential to the proper study of the science of society. It is a feature of organisms that as we rise in the scale of life the meaning of the present life of the organism is to an increasing degree subordinate to the larger meaning of its life as a whole. Similarly, as the advance from primitive society to society of a more organic type takes place, a marked feature of the change is the development of the principles through which the increasing subordination of the

[1] No trace is discoverable on the stone of the alleged epitaph:—
"Tota ruit Babylon; destruxit tecta Lutherus,
Calvinus muros, sed fundamenta Socinus."

present interests of society to the future interests of society is accomplished. It is, however, characteristic of the last-mentioned principles that their operation extends beyond the political consciousness of the state or nation, and that this distinction becomes more and more marked in the higher societies. The scope and meaning of sociology as a science is, therefore, quite different from the scope and meaning of the science of politics. In other quarters, again, the word sociology is often incorrectly used as no more than a covering term for subjects which are fully treated in various subdivisions of social science. Thus when the science of society is distinguished from the special social sciences which fall within its general purview, it may be considered, says Lester F. Ward, that "we may range the next most general departments as so many genera, each with its appropriate species —that is, the classification of the sciences may be made strictly synoptical. When this is done it will be possible for philosophers, like good systematists, to avoid making their ordinal characters include any properly generic ones, or their generic characters include any that are only specific. Thus understood, sociology is freed from the unnecessary embarrassment of having hanging about it in more or less disorder a burden of complicated details, in a great variety of attitudes which make it next to impossible to secure due attention to the fundamental principles of so vast a science. These details are classified and assigned each to its proper place (genus or species), and the field is cleared for the calm contemplation of the central problem of determining the facts, the law and the principles of human association" (*Outlines of Sociology*). This definition, good as it is in some respects, does not make clear to the mind the essential fact of the science, namely, that the principles of sociology involve more than the generalized total of the principles of the subordinate sciences which it is said to include. In Herbert Spencer's writings we see the subject in a period of transition. Spencer placed his *Principles of Sociology* between his *Principles of Psychology* and *Principles of Ethics*. This fact brings out the unsettled state of the subject in his time, while it also serves to exhibit the dominance of the ideas of an earlier stage. For psychology, which Spencer thus places before sociology, cannot nowadays be fully, or even in any real sense scientifically, discussed apart from sociological principles, once it is accepted that in the evolution of the human mind the principles of the social process are always the ultimate controlling factor.

The Claims of Sociology.

Sociology, therefore, as a true science in itself, must be regarded as a science occupied quite independently with the principles which underlie human society considered as in a condition of development. In this sense the conclusions of sociology cannot be fully stated in relation to the phenomena dealt with in any of the divisions of social science, and they must be taken as implying more than the sum total of the results obtained in all of them. The sociologist must always keep clearly before him that the claims of sociology in the present conditions of knowledge go considerably beyond those involved in any of the foregoing positions. As it is the meaning of the social process which in the last resort controls everything, even the evolution of the human mind and all its contents, so none of the sciences of human action, such as ethics, politics, economics or psychology can have any standing as a real science except it obtains its credentials through sociology by making its approach through the sociological method. It is in sociology, in short, that we obtain the ruling principles to which the laws and principles of all the social sciences stand in controlled and subordinate relationship.

Sociology among the Greeks.

The fathers of the science of society may be said to be the Greek philosophers, and in particular Plato and Aristotle. The *Laws* and the *Republic* of the former and the *Ethics* and *Politics* of the latter have, down to modern times, and notwithstanding the great difference in the standpoint of the world and the change in social and political conditions, exercised a considerable influence on the development of the theory of society. To the Greeks the science of society presented itself briefly as the science of the best method of attaining the most perfect life within the consciousness of the associated life of the State. "In this ideal of the State," says Bluntschli, "are combined and mingled all the efforts of the Greeks in religion and in law, in morals and social life, in art and science, in the acquisition and management of wealth, in trade and industry. The individual requires the State to give him a legal existence: apart from the State he has neither safety nor freedom. The barbarian is a natural enemy, and conquered enemies become slaves. . . . The Hellenic State, like the ancient State in general . . . was all in all. The citizen was nothing except as a member of the State. His whole existence depended on and was subject to the State. . . . The State knew neither moral nor legal limits to its power" (*Theory of the State*).

In Christian Europe.

It was within the limits of this conception that most of the Greek theories of society were constructed. The fundamental conception of the Roman writers was not essentially different, although the opportunism of the Roman State, when it became a universal power embracing the social and religious systems of many peoples, in some degree modified it; so that with the growth of *jus gentium* outside the *jus civile*, the later writers of the empire brought into view an aspect of the State in which law began to be to some extent distinguished from State morality. With the spread of Christianity in Western Europe there commenced a stage in which the social structure, and with it the theory of society, underwent profound modifications. These changes are still in progress, and the period over which they extend has produced a great and increasing number of writers on the science of society. The conceptions of each period have been intimately related to the character of the influences controlling development at the time. The writers up to the 14th century are nearly all absorbed in the great controversy between the spiritual and temporal power which was defining itself during this stage in Western history. In the period of the Renaissance and the Reformation the modern development of the theory of society may be said to begin. Machiavelli is the first great name in this period. Bodin with other writers up to the time of Montesquieu carry the development forward in France. The Dutch writer Grotius, although chiefly recognized at the time as an authority on international law, had much influence in bringing into view principles which mark more directly the transition to the modern period, his *De jure belli et pacis*, issued in 1625, being in many respects an important contribution to the theory of society. Hobbes and Locke are the principal representatives of the influential school of writers on the principles of society which the period of the political and religious upheaval of the 17th century produced in England. The ideas of Locke, in particular, exercised a considerable influence on the subsequent development of the theory of the State in Western thought. From the 17th century forward it may be said, strictly speaking, that all the leading contributions to the general body of Western philosophy have been contributions to the development of the science of society. At the time of Locke, and to a large extent in Locke's writings, there may be distinguished three distinct tendencies in the prevailing theory of society. Each of these has since become more definite, and has progressed along a particular line of development. There is first the empirical tendency, which is to be followed through the philosophy of Hume down to the present day, in what may be called—to borrow an idea from Huxley—the physiological method in the modern study of the science of society. A second tendency—which developed through the critical philosophy of Kant, the idealism of Hegel, and the historical methods of Savigny in the field of jurisprudence and of the school of Schmoller in the domain of economics—finds its current expression in the more characteristically German conception of the organic nature of the modern State. A third tendency—which is to be followed through the writings of Rousseau, Diderot, d'Alembert and the literature of the French Revolution—found its most influential form of expression in the 19th century in the theories of the English Utilitarians, from Bentham to John Stuart Mill. In this development it is a theory of the utilitarian State which is principally in view. In its latest phase it has progressed to the expression which it has reached in the theories of Marxian Socialism, in which the corresponding conception of the ascendancy of the economic factor in history may now be said to be the characteristic feature. All of these developments, the meaning of which has now been absorbed into the larger evolutionary conception to be described later, must be considered to have contributed towards the foundation of modern sociology. The definition of the relations to each other of the positions they have severally brought into view is the first important work of the new science.

Comte.

At the period between 1830 and 1842, when Comte published the *Philosophie positive,* the conditions were not ready for a science of society. The Darwinian doctrine of evolution by natural selection had not yet been enunciated, and knowledge of social phenomena was limited and very imperfect. As an instance of the character of the change that has since been in progress, it may be mentioned that one of Comte's main positions—that, indeed, to which most of the characteristic conceptions of his system of philosophy were related—was that "the anatomical and physiological study of individual man" should precede the theory of the human mind and of human society. Here the position is the one already referred to which has prevailed in the study of the social sciences down into recent times. It was supposed that the governing principles of society were to be discovered by the introspective study of the individual mind, rather than that the clue to the governing principles of the individual mind was only to be discovered by the study of the social process. It must now be considered that no really fundamental or far-reaching principle of human development can be formulated as the result of Comte's position. For with the application of the doctrine of evolution to society a position is becoming defined which is almost the reverse of it, namely, that the development of the individual, and to a large extent of the human mind itself, must be regarded as the correlative of the social process in evolution. The study of the principles of the process of social evolution would therefore in this sense have to come before the complete study of the individual, and even to precede the construction of a system of psychology scientific in the highest sense. Comte, apart from his want of mastery of the historical method in dealing with sociological development, possessed, on the whole, little insight into the meaning of the characteristic problem in which the human mind is involved in its social evolution, and to the definition of which not only the processes of Western history, but the positions successively developed in Western thought, must all be considered as contributing. His great merit was the perception of the importance of the biological method in the science of society, the comprehension of the fact that there can be no science of society if its divisions are studied apart from each other; and finally, and although it led at the time to the formulation of no important principle of human development, the intuition that sociology was not simply a theory of the State, but the science of what he called the associated life of humanity.

The Ruling Principle of Early Sociological Conceptions: Influence of Greek Conception of the State.

It has to be observed that, preceding the application of the doctrine of evolution to society, most of the contributions to social science have a certain aspect in which they resemble each other. While in current theories society tends to be presented as evolving, consciously or unconsciously, under stress of natural selection, towards social efficiency, the earlier contributions were merely theories of the meaning and object of society as a medium for the better realization of human desires. In this presentation of the subject the influence of the Greek conception of the State upon modern sociology may be traced down to the present day. At the beginning of the modern period it reappears in Machiavelli (*Titus Livius*, i., iii., and *The Prince*). It is represented in modified form in Hobbes (*Leviathan*), and in Locke (*Two Treatises of Government*), each of whom conceived man as desiring to leave the state of nature and as consciously founding civilized society, "in order that he might obtain the benefits of government" in the associated State. It is continued in Rousseau and the writers of the French Revolution, who similarly imagined the individual voluntarily leaving an earlier state of freedom to put "his person and his power under the direction of the general will" (*Social Contract*). It is characteristic of Jeremy Bentham (e.g. *Principles of Morals and Legislation*, i.) and of J. S. Mill (e.g. *Utilitarianism and Political Economy*, iv., vi.). Finally, it survives in Herbert Spencer, who in like manner sees man originating society and submitting to political subordination in the associated State "through experience of the increased satisfaction derived under it" (*Data of Ethics*). It continues at the present day to be characteristic of many European and some American writers on sociology, who have been influenced both by Spencer and the Latin theory of the State, and who therefore, conceiving sociology not so much as a science of social evolution as a theory of association, proceed to consider the progress of human association as the development of a process "of catering to human desire for satisfactions of varying degrees of complexity." All these ideas of society bear the same stamp. They conceive the science of society as reached through the science of the individual, the associated State being regarded only as a medium through which he obtains increased satisfactions. In none of them is there a clear conception of an organic science of society with laws and principles of its own controlling all the meaning of the individual.

The Doctrine of Evolution.

With the application of the doctrine of evolution the older idea in which society is always conceived as the State and as existing to give increased "satisfaction" is replaced by a new and much more extended conception. In the evolutionary view, the development of human society is regarded as the product of a process of stress, in which progress results from natural selection along the line not of least effort in realizing human desire, but of the highest social efficiency in the struggle for existence of the materials of which society is composed. In the intensity of this process society, evolving towards higher efficiency, tends to become increasingly organic, the distinctive feature being the growing subordination of the individual to the organic social process. All the tendencies of development—political, economic, ethical and psychological—and the contents of the human mind itself, have therefore to be regarded as having ultimate relations to the governing principles of the process as a whole. The science of social evolution has, in short, to be considered, according to this view, as the science of the causes and principles subordinating the individual to a process developing by inherent necessity towards social efficiency, and therefore as ultimately over-ruling all desires and interests in the individual towards the highest social potentiality of the materials of which society is composed. The conflict between the old and the new conceptions may be distinguished to an increasing degree as the scope of modern sociology has gradually become defined; and the opposing ideas of each may be observed to be sometimes represented and blended, in varying degrees of complexity, in one and the same writer.

First Conceptions of Society as an Organism.

It was natural that one of the first ideas to be held by theorists, as soon as sociology began to make progress to the position of a real science, was that society must be considered to be organic, and that the term "social organism" should be brought into use. An increasing number of writers have been concerned with this aspect of the subject, but it has to be noted as a fact of much interest that all the first ideas of society as an organism move within the narrow circle of the old conception of the State just described. The "social organism" in this first stage of theory is almost universally confused with the State. The interests of the social organism are therefore confused with the interest of the individuals which men saw around them in the State. The science of society was accordingly regarded as no more than the science of realizing most effectively here and now the desires of those comprising the existing State. Sidgwick, for instance, considered the science of politics and the science of sociology as practically coincident, and his *Elements of Politics*, extraordinary to relate, contains only a few words in which it is recognized that the welfare of the community may be interpreted to mean the welfare not only of living human beings, but of those who are to come hereafter; while there is no attempt to apply the fact to any law or principle of human development. Bentham's utilitarian philosophy, like that of the two Mills, was based almost entirely on the idea of the State conceived as the social organism. Writers like Herbert Spencer (*Sociology*) and Schäffle, who was for a time minister of commerce for Austria (*Bau und Leben des socialen Körpers*), instituted lengthy comparisons between the social organism considered as the State and the living individual organism. These efforts reached their most characteristic expression in the work of the sociologists who have followed G. Simmel in lengthy and ingenious attempts at classifying associations, considering them "as organizations for catering to human desire." In all these efforts the conception of the State as the social organism is vigorously represented, although it is particularly characteristic of the work of sociologists in countries where the influence of Roman law is still strong, and where, consequently, the Latin conception of the State tends to influence all theories of society as soon as the attempt is made to place them on a scientific basis. The sterilizing effect for long produced on sociology by this first restricted conception of the social organism has been most marked. It is often exemplified in ingenious attempts made, dealing with the principles of sociology, to construct long categories of human associations, based on quite superficial distinctions. None of the comparisons of this kind that have been made have contributed in any marked degree to the elucidation of the principles of modern society. Paul Leroy-Beaulieu's criticism of Schäffle's efforts at comparisons—anatomical, physiological, biological and psychological—between the individual organism and the State as a social organism applies to most of the attempts of this period to institute biological comparisons between the life of the social organism and that of organisms in general, "the mind sinks overwhelmed under the weight of all these analogies, these endless divisions and subdivisions to which they give rise. . . . The result is not in proportion to the effort" (*L'État moderne et ses fonctions*).

Herbert Spencer

In tracing the direction of this conflict between the newer and older tendencies in modern sociology, it is in Herbert Spencer's writings that the student will find presented in clearest definition the characteristic difficulty with which the old view has tended to be confronted, as the attempt has continued to be made to enunciate the principles of human development from the standpoint that society is to be considered as a "social organism," but while as yet there is no clear idea of a social organism with its own laws and its own consciousness quite distinct from, and extending far beyond those governing the interests of the individuals at present comprising the State.

With the application of the doctrine of evolution to society considered as an organism, a position has been brought into view of great interest. It is evident in considering the application of natural selection to human society that there is a fact, encountered at the outset, which is so fundamental that it must be held to control all the phenomena of social evolution. It is nowadays a commonplace of knowledge, that the potential efficiency of an organism must always be taken to be greater than the sum total of the potential efficiency of all its members acting as individuals. This arises in the first instance from the fact, to be observed on all hands in life, of the effects of organization, of division of labour, and of specialization of work. But in an organism of indefinitely extended existence like human society, it arises in a special sense from the operation of principles giving society prolonged stability. By these principles individual interests are subordinated over long periods of time to the larger interests of organic society in which the individuals for the time being cannot participate; and it is from this cause that civilization of the highest type obtains its characteristic potency and efficiency in the struggle for existence with lower types. There follows from this fact, obvious enough once it is mentioned, an important inference. This is that in the evolution of society natural selection will, in its characteristic results, reach the individual not directly, but through society. That is to say, in social evolution, the interests of the individual, *qua* individual, cease to be a matter of first importance. It is by development in the individual of the qualities which will contribute most to the efficiency of society, that natural selection will in the long run produce its distinctive results in the human individual. It is, in short, about this function of socialization, involving the increasing subordination of the individual, that the continued evolution of society by natural selection must be held to centre. Societies in which the individuals resist the process quickly reach the limits of their progress, and have to give way in the struggle for existence before others more organic in which the process of subordination continues to be developed. In the end it is the social organizations in which the interests of the individual are most effectively included in and rendered subservient to the interests of society considered in its most organic aspect that, from their higher efficiency, are naturally selected. In other words, it is the principles subordinating the individual to the efficiency of society in those higher organic aspects that project far beyond the life-interests of its existing units which must ultimately control all principles whatever of human association.

Spencer and Natural Selection.

Spencer, in an elaborate comparison which he made (*Essays*, vol. i., and *Principles of Sociology*) between the social organism and the individual organism brought into view a position which in its relation to this capital fact of human evolution exhibits in the clearest manner how completely all the early evolutionists, still under the influence of old conceptions, failed at first to grasp the significance of the characteristic problems of the social organism. Spencer's comparison originally appeared in an article published in the *Westminster Review* for January 1860 entitled "The Social Organism." This article is in many respects one of the most noteworthy documents in the literature of the last half of the 19th century. In comparing the social with the individual organism Spencer proceeded, after noting the various aspects in which a close analogy between the two can be established, to make, as regards society, an important distinction by which the nature of the difficulty in which he is involved is immediately made apparent. While in an individual organism, he pointed out, it is necessary that the lives of all the parts should be merged in the life of the whole, because the whole has a corporate consciousness capable of happiness or misery, it is not so with society. For in society, he added, the "living units do not and cannot lose individual consciousness, since the community as a whole has no corporate consciousness." Spencer proceeded, therefore, to emphasize the conclusion that "this is an everlasting reason why the welfare of citizens cannot rightly be sacrificed to some supposed benefit of the State; but why, on the other hand, the State is to be maintained solely for the benefit of citizens." The extraordinary conclusion is indeed reached by Spencer that "the corporate life in society must be subservient to the lives of the parts, instead of the lives of the parts being subservient to the corporate life." It will be here clearly in evidence that the "social organism" which Spencer had in view was the State. But it will be noticed at the same time how altogether remarkable was the position into which he was carried. Spencer, like most thinking minds of his time, had the clearest vision, constantly displayed in his writings, of the scientific importance of that development in history which has gradually projected the conception of the individual's rights outside all theories of obligation to the State. He wrote at a time when the attention of the Western mind in all progressive movements in Western politics had been for generations fixed on that development in which the liberties of the individual as against the State had been won. This development had involved nearly all Western countries in a titanic struggle against the institutions of an earlier form of society resting on force organized in the State. Spencer, therefore, like almost every advanced writer of his period, had constantly before him the characteristic fact of his age, namely, that the meaning of the individual had come to be in some way accepted as transcending all theories of the State and all theories of his obligations to the State. The position was, therefore, very remarkable. Spencer has been for long accepted by the general mind as the modern writer who more than any other has brought into use the term "social organism," and who has applied the doctrine of evolution to the theory of its life. Yet here we see him involved in the apparent self-stultification of describing the social organism to us as that impossible thing, an organism "whose corporate life must be subservient to the lives of the parts instead of the lives of the parts being subservient to the corporate life." It was obvious that some profound confusion existed. The science of society was evidently destined to carry us much farther than this. If natural selection was to be taken as operating on society, and therefore as tending to produce the highest efficiency out of the materials that comprise it, it *must* be effecting the subordination of the interests of the units to the higher corporate efficiency of society. But one of only two conclusions could therefore result from Spencer's position. If we were to regard the "social organism" as an organism in which the corporate life must be subservient to the lives of the parts, instead of the lives of the parts being subservient to the corporate life, it would be necessary to hold that the individual had succeeded in arresting the characteristic effects of natural selection on society. But for the evolutionist, whose great triumph it had been to reveal to us the principles of natural selection in universal operation throughout life elsewhere, to have to regard them as suspended in human society would be an absurd anti-climax. Such being scarcely conceivable as a final position, it remained only to infer that natural selection must still be subordinating individual interests to some larger social meaning in the evolutionary process. But in this case, society must be subject to principles which reach farther than those Spencer conceived: it must be organic in some different and wider sense than he imagined, and the analogy of the "social organism" as confined within the consciousness of ascendant interests in the political State must be considered to be a false one.

A New Horizon in Sociology.

We had, in short, reached a capital position in the history of sociology from which an entirely new horizon was about to become visible. The principles of society organic in a wider sense than had hitherto been conceived were about to be brought into the discussion. All the phenomena of the creeds and ethical systems of humanity, of the great systems of religion and philosophy, with the problems of which the human mind had struggled over immense stretches of time as the subordinating process had unfolded itself in history, were about to be brought into sociology. And not now as if these represented some detached and functionless development with which the science of society was not directly concerned, but as themselves the central feature of the evolutionary process in human society. The stage in the history of sociology characterized by the confusion of the principles governing the social organism with those governing the State, the stage which had lasted from the time of the Greeks to Spencer, and which had witnessed towards its close Sidgwick's statement that the science of sociology was in effect coincident with the science of politics, was thus bound to be definitely terminated by the application to the science of society of the doctrine of evolution. Yet Spencer, despite his popular association with the doctrine of evolution, is thus not to be reckoned as the first of the philosophers of this new stage. His place is really with the last great names of the preceding period. For his conception of society was that of Bentham, Mill and Sidgwick. His *Principles of Sociology* as a contribution to modern evolutionary science is necessarily rendered to a large extent futile by the sterilizing conception of a social organism "in which the corporate life must be subservient to the lives of the parts." It is indeed in the reversal of this conception that the whole significance of the application of the doctrine of evolution to the science of society consists. Henceforward we shall have to regard the social process in evolution as a process with its own interests, its own psychology, its own consciousness and its own laws, all quite distinct from the political consciousness of the modern State, though indirectly controlling and governing the consciousness of the State so thoroughly that there can be no true science of the latter without a science of the former.

The First Darwinians in Sociology.

The new situation created in sociology as the doctrine of evolution began to be applied to the science had features of great interest. The advance had been made to a central position along two entirely distinct lines. The army of workers was, in consequence, divided into two more or less isolated camps, each largely in ignorance of the relation of its own work to that in the other section. It is often said as a reproach to sociology in the period through which we are passing that it attracts the kind of recruits who are not best equipped for its work, while it repels the kind of mind of philosophical training and wide outlook which it ought to enlist in its service and for which it has most urgent need, the loss to sociology both in credit and efficiency being immense. This is the result of a peculiar situation. Those who are best qualified to understand the nature and scope of the problems with which sociology has to deal cannot fail to have the conviction strongly developed in them that the Darwinian principles of evolution which reveal to us what may be described as the dynamics of the universal life process have very important relations to the dynamics of the social process. The situation which has arisen in sociology, however, is a very curious one, although it is one easy to understand when the causes are explained. When the endeavour is made to follow Darwin and the early Darwinians through the facts and researches which led to the formulation of the law of natural selection it may be observed how their preoccupation was almost exclusively with the details of the struggle for existence not in societies, but as it was waged between individuals. This was so as a matter of course, from the character of the facts which wild nature supplied, reinforced as they were, by observations on domestic animals and the practices of breeders.

Darwin made no systematic study of society; and outside human society the struggle through which natural selection has operated has been mainly between individuals. It is, of course, sometimes remarked that the social life exists among animals and that the laws of the social life and of the herd are to be observed there, but as a matter of fact there is nothing whatever elsewhere in life to compare with what we see taking place in human society, namely, the gradual integration—still under all the stress of natural selection expressing its effects in the person of the individual—of an organic social process resting ultimately on mind. The laws of this process are necessarily quite different from the laws of the other and simpler process in operation lower down in life. If we regard the classes from which sociology as a science should be able to draw its most efficient recruits we see that at the present day they fall mainly into two camps. There are in the one camp the exponents of biological principles, often trained in one or more of the departments of biological science, who are attempting the application to human society of the principles with which they have become familiar elsewhere in life. There are in the second camp the exponents of various aspects of social philosophy. When the exponent of Darwinian principles advances to the study of society he is naturally strong in the conviction that he has in his hands a most potent instrument of knowledge which ought to carry him far in the organization of the social sciences and towards the unification of the leading principles underlying the facts with which they deal. But what we soon begin to see is that his training has been, and that his preoccupation still continues to be, with the facts and principles of the struggle for existence between individuals as displayed elsewhere in life. He does not easily realize, if he has not been trained in social philosophy, how infinitely more complex all the problems of natural selection have become in the social integration resting on mind which is taking place in human affairs; or how the social efficiency with which he has become now concerned is something quite distinct from the individual efficiency with which he has been concerned elsewhere. He does not readily comprehend how the institutions which he sees being evolved in history have, in their effects on the individual, laws quite different from those which he applies in the breeding of animals; or how the dualism which has been opened in the human mind, as natural selection acts first of all on the individual in his own struggle with his fellows, and then, and to a ruling degree, acts on his as a member of organic society in the evolution of social efficiency, has in the religious and ethical systems of the race a phenomenology of its own, stupendous in extent and absolutely characteristic of the social process, which remains a closed book to him and the study of which he is often apt to consider for his purposes as entirely meaningless. All this became rapidly visible in the first approach of the early Darwinians to the science of society.

Darwin, as stated, had attempted no comprehensive or systematic study of society. But in a few chapters of the *Descent of Man* he had discussed the qualities of the human mind, including the social and moral feelings, from the point of view of the doctrine of natural selection enunciated in the *Origin of Species*. The standpoint he took up was, as might be expected, practically that of Mill and Spencer and other writers of the period on social subjects, from whom he quoted freely. But the note of bewilderment was remarkable. The conclusion remarked upon as implied in Spencer's theory of the social organism, but which Spencer himself hesitated to draw, namely, that natural selection was to be regarded as suspended in human society, Darwin practically formulated. Thus at times Darwin appeared to think that natural selection could effect but comparatively little in advanced society. "With highly civilized nations," he says, "continued progress depends to a subordinate degree on natural selection." While Darwin noted the obvious usefulness of the social and moral qualities in many cases, he felt constrained at the same time to remark upon their influence in arresting, as appeared to him, the action of natural selection in civilization. "We civilized men," he continues, "do our utmost to check the process of elimination (of the weak in body and mind); we build asylums for the imbeciles, the maimed and the sick; we institute poor laws; and our medical men exert their utmost skill to save the life of every one to the last moment." There is here in evidence no attempt to connect the phenomena thus brought into view with some wider principle of the evolutionary process which evidently must control them. There is no perception visible in Darwin's mind of these facts as constituting the phenomenology of a larger principle of natural selection; or of the higher organic efficiency in the struggle for existence of societies in which the sense of responsibility to life thus displayed has made most progress; or of the immense significance in social evolution as distinct from individual evolution of that deepening of the social consciousness of which this developing spiritual sense of responsibility to our fellow creatures is one of the outward marks characteristic of advanced societies.

Darwin.

In the year 1889 Alfred Russel Wallace in a statement of his conception of the doctrine of evolution in his book, *Darwinism*, brought more clearly into view the fundamental difficulty of the early Darwinians in applying the doctrine of natural selection to society. In the last chapter of the book Mr Wallace maintained that there were in "man's intellectual and moral nature . . . certain definite portions . . . which could not have been developed by variation and natural selection alone." Certain faculties, amongst which he classed the mathematical, artistic and metaphysical, the latter covering qualities with which he considered priests and philosophers to be concerned, were, he asserted, "altogether removed from utility in the struggle for life," and were, therefore, he thought, "wholly unexplained by the theory of natural selection." In this elementary conception which still survives in popular literature, the same confusion between individual efficiency and social efficiency has to be remarked upon. And there is in evidence the same failure to perceive that it is just these intellectual and moral qualities which are the absolutely characteristic products of natural selection in advanced society, in that they contribute to the highest organic social efficiency. Wallace in the result proposed to consider man, in respect of these higher portions of his mind, as under the influence of some cause or causes wholly distinct from those which had shaped the development of life in its other characteristics. The weakness of this position was immediately apparent. To remove man as regards qualities so directly associated with his social evolution from the influence of the law of natural selection was felt to be a step backwards. The effect produced on the minds of the younger school of evolutionists was deep. It operated, indeed, not to convince them that Wallace was right, but to make them feel that his conception of natural selection operating in human society was still in some respect profoundly and radically incomplete.

Wallace.

A few years later, Huxley, though approaching the matter from a different direction, displayed a like bewilderment in attempting to apply the doctrine of evolution to the phenomena of organic society. With his mind fixed on the details of the individual struggle for existence among animals, Huxley reached in the Romanes lecture, delivered at Oxford in 1893, a position little different from that in which Wallace found himself. In this lecture Huxley actually proceeded to place the ethical process in human society in opposition to the cosmic process, to which latter alone he considered the struggle for existence and the principle of natural selection belonged. "Social progress," he went on to say, "means a checking of the cosmic process at every step and the substitution for it of another which may be called the ethical process; the end of which is not the survival of those who may happen to be the fittest, in respect of the whole of the conditions which obtain, but of those who are ethically the best." Thus the remarkable spectacle already witnessed in Spencer, Darwin and Wallace of the evolutionist attempting to apply his doctrines to human society, but having to regard his own central principle of natural selection as having been suspended therein is repeated in Huxley. The futility of contemplating the ethical process as something distinct from the cosmic process was at once apparent. For the first lesson of evolution as applied to society must be that they are one and the same. So far indeed from ethical process checking the cosmic process, it must be regarded as the last and highest form of the cosmic process. The sense of subordination and sacrifice which forms the central principle of all the creeds of humanity, so far from being, as Wallace imagined, "altogether removed from utility" is, indeed, the highest form of social efficiency through which natural selection is producing its most far-reaching effects in the evolution of the most advanced and organic types of civilization.

Huxley.

A similar tendency continued to be in evidence in other directions. In an effort made a few years later to found a society for the study of sociology in Great Britain a very characteristic feature of the first papers contributed was the attempt to apply elementary biological generalizations regarding natural selection to a highly complex organism like human society, the writers having in most cases made no previous extensive or special study of the social process in history. The confusion between what constitutes individual efficiency in the individual and that higher social efficiency in the individual which everywhere controls and overrules individual efficiency was very marked. An early paper contributed in 1904 was by Mr (afterwards Sir) Francis Galton, one of the last and greatest of the early Darwinians Galton had made many original contributions to the doctrine of evolution, and had been occupied previously with researches into individual efficiency as displayed among families, his *Hereditary Genius* being a notable book of this type. The object of his paper was to explain the scope and aim of a new science, "eugenics," which he defined as the science which deals with all the influences that improve the inborn qualities of the race and develop them to the utmost advantage. Galton found no difficulty whatever in setting up his sociological standards for the best specimens of the race. Even the animals in the Zoological Gardens, he

Galton.

said, might be supposed to know the best specimens of their class. In society the list of best qualities would include health, energy, ability, manliness and the special aptitudes required by various professions and occupations. Everything in "the scientific breeding of the human race" was to be much as in the breeding of animals; for Galton proposed to leave morals out of the question as involving too many hopeless difficulties. This was the basis of the scheme of qualities from which he proposed to proceed to the improved breeding of society. The proposal furnishes one of the most striking and characteristic examples which have appeared of the deep-seated confusion prevailing in the minds of the early Darwinians between social efficiency and individual efficiency. Even from the few minor examples of society among the lower animals the true sociological criticism of such standards in eugenics might easily be supplied. For at the point at which the social insects, for instance, began their social integration all their standards were in the qualities which gave success in the struggle for existence between individuals. Had they, therefore, understood eugenics only in this light and in Galton's sense, they would have condemned at the first the beginnings of the peculiar social efficiency of the queen bee which now makes her devote her life entirely to egg-laying; still more would they have condemned the habits of the drones, through long persistence in which they have become degenerate as individuals; and in particular they would have condemned the habits of the workers which have led to their present undeveloped bodies and abortive individualistic instincts. But all these things have contributed in the highest degree to the social efficiency of the social insects and have made the type a winning one in evolution. The social integration of the social insects has been comparatively simple and did not, like that of human society, rest ultimately on mind, yet even in this elementary example it was evident what ruin and disaster would result from miscalled scientific breeding of the race if undertaken within the limits of such restricted conceptions of social efficiency. Galton's preoccupation, as in the case of most biological and medical schemes of improvement in the past, was with those individualistic qualities which contribute to the individual's success in the struggle for existence with his fellows. But it has been continuously obvious in history that individuals of the very highest social efficiency, the great organic minds of the race who, often quite unsuccessful in their lives as judged by individualistic standards, and who, often quite unperceived and unappreciated by their contemporaries, have been the authors of ideas, or moral conceptions or works of such organic importance that they have carried the race from one social horizon into another, have been just those individuals who would have entirely failed to pass the kind of prize-animal standards which Galton proposed to set up.

The Close of the First Stage of Darwinian Theory.

Galton's essay may be said to close that first epoch in the application of biological conceptions to sociology which opened with Spencer's essay in 1860. With the extending conception of the organic interests of society during the intervening period the idea of social efficiency had altered profoundly. For instance, a supposed standard of efficiency, which like Malthusianism represented to Mill at the opening of the period the last conclusion of science, had become towards the close scarcely more than a standard of "race suicide." It was not surprising that in these circumstances the representatives of those sciences which rested on a knowledge of the social process in history and philosophy continued to look coldly on the attempt of the first Darwinians to apply Darwinian principles to sociology. True, the development in their own sciences had been almost equally sterile, for they had themselves as yet no reasoned conception of the enormous importance of the Darwinian principle of evolution to these sciences in its capacity to reveal to them the dynamics of the social process. But they had watched the development of institutions in history; they had studied the growth of social types and the integration of great systems of belief; and they had struggled with the capital problems of the human mind in psychology and philosophy as the process had continued. The two armies of workers continued to be organized into isolated camps, each with the most restricted conception of the nature and importance of the work done by the other and of its bearing upon their own conclusions. One of the most remarkable results of such a situation—a result plainly visible in the valuable collection of essays edited by Professor Seward which was issued from the Cambridge University Press in commemoration of the centenary of Darwin's birth—is the extremely limited number of minds in our time of sufficient scope of view to be able to cover the relation of the work of both sets of these workers to sociology.

Further Extension to Sociology of the Evolutionary Conception.

It remains now to consider the relation to the position in modern sociology of the extended conception that society must be considered to be organic in some wider sense than the first Darwinians thus imagined it and also in some wider sense than that in which Sidgwick imagined it when he said that sociology was in effect coincident with the science of politics. The present writer has laid it down elsewhere (*The Two Principal Laws of Sociology*: Bologna) that there is a fundamental principle of sociology which has to be grasped and applied before there can be any real science of sociology. This principle may be briefly stated as follows:—

The social process is primarily evolving in the individual not the qualities which contribute to his own efficiency in conflict with his fellows, but the qualities which contribute to society's efficiency in the conflict through which it is gradually rising towards a more organic type.

This is the first law of evolutionary sociology. It is this principle which controls the integration which is taking place under all forms in human society—in ethical systems, in all political and economic institutions, and in the creeds and beliefs of humanity—in the long, slow, almost invisible struggle in which under a multitude of phases natural selection is discriminating between the standards of nations and types of civilization.

Dealing first with political and economic institutions; the position reached in Spencer's sociology may be said to represent the science of society in a state of transition. It represents it, that is to say, in a stage at which the Greek theory of society has become influenced by the doctrine of evolution applied to modern conceptions, but while as yet no synthesis has been achieved between the conflicting and even mutually exclusive ideas which are involved. The Greek theory of society is represented in Spencer in his practical identification of "the social organism" with the State. The modern idea, however, which carries Spencer far beyond the principles of Greek society—as these principles were summarized, for instance, in the passage already quoted from Bluntschli—is clearly in evidence. It may be observed to be expressed in the recognition of a principle resident in modern society which in some manner projects the individual's rights outside and beyond the whole theory and meaning of the State. In other words, in society as Spencer conceives it, "the welfare of citizens cannot rightly be sacrificed to some supposed benefit of the State"; whereas, according to the Greek theory and the theory of Roman law, the citizen's whole existence depended on and was subject to the State. "The State knew neither moral nor legal limits to its power." If, however, it be considered that modern society has made progress beyond the Greek, and if it be accepted that the theory of evolution involves the conclusion that society progresses towards increased efficiency in a more organic type, there follows from the foregoing an important inference. This is that it now becomes the task of modern sociology, as a true science, to show that the principle in modern civilization which distinguishes it from society of the Greek period—namely, that principle which Spencer rightly recognized, despite the contradictions in which he became involved, as rendering the life of the individual no longer subservient to the corporate life of the State—is itself a principle identified not with individualism but with the increasing subordination of the individual to a more organic type of society. It must, in short, remain for the evolutionist, working by the historical method scientifically applied, to present the intervening process in history—including the whole modern movement towards liberty and enfranchisement, and towards equality of conditions, of rights and of economic opportunities—not as a process of the increasing emancipation of the individual from the claims of society, but as a process of progress towards a more organic stage of social subordination than has prevailed in the world before.

When society is considered as an organism developing under the influence of natural selection along the line of the causes which contribute to its highest potential efficiency, and therefore tending to have the mean centre of its organic processes projected farther and farther into the future, it is evident that it must be the principles and ideas which most effectively subordinate over long periods of time the interests and the capacities of the individuals of which it is composed to the efficiency of the whole which will play the leading part in social evolution. In primitive society, the first rudiments of social organization undoubtedly arose, not so much from conscious regard to expediency or "increased satisfactions" as from fitness in the struggle for existence. "The first organized societies must have been developed, like any other advantage, under the sternest conditions of natural selection. In the flux and change of life the members of those groups of men which in favourable conditions first showed any tendency to social organization became possessed of a great advantage over their fellows, and these societies grew up simply because they possessed elements of strength which led to the disappearance before them of other groups of men with which they came into competition. Such societies continued to flourish, until they in their turn had to give way before other associations of men of higher social efficiency" (*Social Evolution*, ii.). In the social process at this stage all the customs, habits, institutions, and beliefs contributing to produce a higher organic efficiency of society would be naturally selected, developed and perpetuated. It is in connexion with this fact that the clue must be sought to the evolution of those institutions and beliefs of early society which have been treated of at length in researches like those of M'Lennan, Tylor, Lubbock, Waitz, Letourneau, Quatrefages, Frazer, and others of equal importance. For a long period in the first stages the highest potentiality of the social organization would be closely associated with military efficiency. For in the evolution of the social organism, as has been said, while the mean centre of the processes involving its organic identity would tend to be projected into the future, it would at the same time always be necessary to maintain efficiency in current environment in competition with rival types of lower future potentiality. Amongst primitive peoples, where a great chief, law-giver and military leader appeared, the efficiency of organized society resting on military efficiency would, as a matter of course, make itself felt in the struggle for existence. Yet as such societies would often be resolved into their component elements on the death of the leader, the overruling importance—on the next stage of the advance towards a more organic type—of ideas which would permanently subordinate the materials of society to the efficiency of the whole would make itself felt. Social systems of the type in which authority was perpetuated by ancestor-worship—in which all the members were therefore held to be joined in an exclusive religious citizenship founded on blood relationship to the deities who were worshipped, and in which all outsiders were accordingly treated as natural enemies, whom it would be a kind of sacrilege to admit to the rights of the State—would contain the elements of the highest military potentiality. The universal mark which ancestor-worship has left on human institutions in a certain stage of social development is doubtless closely associated with this fact. The new and the older tendencies in sociology are here also in contrast; for whereas Herbert Spencer has been content to explain ancestor-worship as arising from an introspective and comparatively trivial process of thought assumed to have taken place in the mind of early man in relation to a supposed belief in ghosts (*Principles of Sociology*, 68–207), the newer tendency is to consider science as concerned with it in its relation to the characteristic principles through which the efficiency of the social organization expressed itself in its surroundings. The social, political and religious institutions disclosed in the study of the earliest civilizations within the purview of history must be considered to be all intimately related to the ruling principles of this military stage. The wide reach and significance of the causes governing the process of social evolution throughout the whole of this period may be gathered from treatises like Seebohm's *Structure of Greek Tribal Society*, Maine's *Ancient Law*, *History of Institutions*, and *Early Law and Custom*, Fowler's *City-State of the Greeks and Romans*, and in a special sense from the comparative study of Roman law, first of all as it is presented in the period of the Twelve Tables, then as the *jus civile* begins to be influenced by the *jus gentium*, and lastly as its principles are contrasted with those of English common law in the modern period. In most of the philosophical writings of the Greeks, and in particular in the *Ethics* and *Politics* of Aristotle, and in many of the *Dialogues* of Plato, the spirit of the principles upon which society was constructed in this stage may be perceived as soon as progress has been made with comparative studies in other directions.

The Basis of Modern Sociology.

A very pregnant saying of T. H. Green was that during the whole development of man the command, "Thou shalt love thy neighbour as thyself" has never varied. What has varied is only the answer to the question—Who is my neighbour? If in the light of this profoundly true reflection we watch the progress of society from primitive conditions to the higher stages, it may be observed to possess marked features. Where all human institutions, as in the ancient civilizations, rested ultimately on force; where outsiders were regarded as natural enemies, and conquered enemies became slaves; where, as throughout all this phase of social evolution, a rule of religion was a rule of law identified with the principles of the State (Maine, *Ancient Law*); where the State itself was absolute as against the individual, knowing "neither moral nor legal limits to its power"; and where all the moral, intellectual and industrial life of the community rested on a basis of slavery—the full limits of the organic principle of social efficiency would in time be reached. The conditions would be inherent in which all social institutions would tend to become closed absolutisms organized round the conception of men's desires in the present. And the highest outward expression in which the tendencies in ethics, in politics, and in religion must necessarily culminate would be the military State, bounded in its energies only by the resistance of others, necessarily acknowledging no complete end short of absolute dominion, and therefore staying its course before no ideal short of universal conquest. This was the condition in the ancient State. It happened thus that the outward policy of the ancient State to other peoples became, by a fundamental principle of its life, a policy of military conquest and subjugation, the only limiting principle being the successful resistance of the others. The epoch of history moved by inherent forces towards the final emergence of one supreme military State, in an era of general conquest, and culminated in the example of universal dominion which we had in the Roman world before the rise of the civilization of our era.

Extension of the Sense of Human Responsibility.

The influence upon the development of civilization of the wider conception of duty and responsibility to one's fellow men which was introduced into the world with the spread of Christianity can hardly be over-estimated. The extended conception of the answer to the question—Who is my neighbour? which has resulted from the characteristic doctrines of the Christian religion—a conception transcending all the claims of the family, group, state, nation, people or race, and even all the interests comprised in any existing order of society—has been the most powerful evolutionary force which has ever acted on society. It has tended gradually to break up the absolutisms inherited from an older civilization and to bring into being an entirely new type of social efficiency.

Its Influence on Social Efficiency.

As society under this influence continued to be impelled to develop towards a still more organic type, the greatly higher potentiality of a state of social order which, while preserving the ideal of the highly organized state and the current efficiency of society in competition with lower types, was influenced by conceptions that dissolved all those closed absolutisms, and released human energies into a free conflict of forces by projecting the principles of human responsibility outside the State, became apparent. In many of the religions of the East such conceptions have been inherent, Christianity itself being a characteristically Eastern religion. But no Eastern people has been able to provide for them the permanent defensive military *milieu* in history in which alone their potentiality could be realized. The significance of modern Japan in evolution consists largely in the answer she is able to give to the question as to whether she will be able to provide in the future such a *milieu* for such a conception among an Eastern people.

In History Projected Efficiency (in the Future) has always rested on Military Efficiency (in the Present).

The significance of the culmination of the military epoch in the ancient classic civilizations of the Western world, which preceded the opening of the era in which we are living, and of the fact that the peoples of the same descent who were destined to carry on the civilization of the existing era represent the supreme military stock by natural selection, not only of the entire world, but of the evolutionary process itself in human history, will therefore be evident.

With the spread, accordingly, amongst peoples of this origin, and in such a defensive military *milieu* in history, of a new conviction of responsibility to principles extending beyond the consciousness of the political State, there began a further and more organic stage of the evolutionary process in society. The gradual dissolution in the era in which we are living of all the closed absolutisms within the State, in which human action and ideas had hitherto been confined, is apparently the characteristic phenomenon of this stage. Progress is towards such a free and tolerant, but intense and efficient, conflict of forces as was not possible in thc world before. It is, it would appear, in this light that we must regard the slow dissolution of the basis of ideas upon which slavery rested; the disintegration of the conceptions which supported the absolute position of the occupying classes in the State; the undermining of the ideas by which opinion was supported by the civil power of the State in the religious struggles of the middle ages; the growth of the conception that no power or opinion in the State can be considered as the representative of absolute truth; the consequent development of party government amongst the advanced peoples, with the acknowledgment of the right of every department of inquiry to carry results up to that utmost limit at which they are controlled only by the results obtained in other departments of activity with equal freedom; the growth of the conception, otherwise absurd, of the native equality of men; the resulting claim, otherwise similarly indefensible, of men to equal voting power irrespective of status or possessions in the State which has been behind the movement towards political enfranchisement; and, finally, the devclopment of that conviction which is behind the existing challenge to all absolute tendencies in economic conditions in the modern world—namely, that the distribution of wealth in a well-ordered State should aim at realizing political justice. There are all the features of an integrating process in modern history. They must be considered as all related to a controlling principle inherent in the Christian religion which has rendered the evolutionary process in society more organic than in any past stage—namely, the projection of the sense of human responsibility outside the limits of all the creeds and interests which had in previous stages embodied it in the State (Kidd, *Prin. West. Civil.*). The meaning, in short, which differentiates our civilization from that of the ancient civilizations of Greece and Rome is that modern Western civilization represents in an ever-increasing degree the enfranchisement of the future in the evolutionary process. So great has become the prestige of our civilization through the operation of this principle in it that its methods and results are being eagerly borrowed by other peoples. It is thereby so materially influencing the standards of conduct and culture thoughout the world that the developments which other nations are undergoing have in a real sense tended to become scarcely more than incidents in the expansion of Western civilization.

The Principle of Efficiency in Modern Civilization is the Enfranchisement of the Future.

We live in the presence of colossal national armaments, and in a world, therefore, in which we are continually met with the taunt that force is still everywhere omnipotent. It may be perceived, however, that beneath all outward appearances a vast change has been taking place. In the ancient civilizations the tendency to conquest was an inherent principle in life of the military State. It is no longer an inherent principle in the modern State. The right of conquest is indeed still acknowledged in the international law of civilized States; but it may be observed to be a right becoming more and more impracticable among the more advanced peoples. Reflection, moreover, reveals the fact that the right of conquest is tending to become impracticable and impossible, not, as is often supposed, because of the huge armaments of resistance with which it might be opposed, but because the sense of social responsibility has been so deepened in our civilization that it is almost impossible that one nation should attempt to conquer and subdue another after the manner of the ancient world. It would be regarded as so great an outrage that it would undoubtedly prove to be one of the maddest and one of the most unprofitable adventures in which a civilized State could engage. Militarism, it may be distinguished, is becoming mainly defensive amongst the more advanced nations. Like the civil power within the State, it is tending to represent rather the organized means of resistance to the methods of force should these methods be invoked by others temporarily or permanently under the influence of less evolved standards of conduct.

Modern Militarism is therefore becoming a Defensive, not an Offensive Principle.

In thus regarding the social process in Western history, the projected efficiency of which now, after many centuries of development, begins to realize itself to an increasing degree in determining competition with other types of society throughout the world, it may be observed that the result by which a synthesis of the older and later views may be attained is already in sight. It was pointed out that if the principle which Spencer rightly recognized in modern society as rendering the life of the individual no longer subservient to the corporate life of the State was to be accepted as a principle of progress distinguishing modern civilization from that of the Greek period, it would be necessary for the sociologist to exhibit it not as indicating the larger independence of the individual, but as a principle identified with the increasing subordination of the individual to a more organic type of society. Here, therefore, this result is in process of accomplishment. The intervening process in history—including the whole modern movement towards liberty and enfranchisement, towards equality of conditions, towards equality of political rights and towards equality of economic opportunities—is presented as a process of development towards a more advanced and organic stage of social subordination than has ever prevailed in the world before (*Princ. West. Civil.* xi.). In this light, also, it may be observed how the claim of sociology to be the most advanced of all the theoretical sciences is justified. For if the historical process in the civilization of the era in which we are living is thus to be regarded as a process implying the increasing subordination of the individual to a more organic type of society, then the study of sociology as embracing the principles of the process must evidently involve the perception and comparison of the meaning of the fundamental positions disclosed in the history of political progress, of the problems with which the human mind has successively struggled in the phases of religious development, and, lastly, of the positions with which the intellect has been confronted as the stages of the subordinating process have

Individualism is only a Process of more Organic Social Subordination.

gradually come to define themselves in history. The positions outlined in the developments already referred to which have come down through Hume and Huxley, through Kant and Hegel, through Grotius and Savigny, through Roscher and Schmoller, through the expression which English utilitarianism has reached in Herbert Spencer as influenced by the English theory of the rights of the individual on the one hand, and in Marxian Socialism as influenced by the Latin conception of the omnipotence of the State on the other, have thus all their place, meaning and scientific relations in the modern study of sociology. It must be considered that the theory of organic evolution by natural selection and the historical method will continue in an increasing degree to influence the science of society.

The Claim of Sociology as the Master Science.

The sociological law that "the social process is primarily evolving in the individual not the qualities which contribute to his own efficiency in conflict with his fellows, but those qualities which contribute to society's efficiency in the conflict through which it is gradually rising towards a more organic type," carries us into the innermost recesses of the human mind and controls the science of psychology. For it is thus not the human mind which is consciously constructing the social process in evolution; it is the social process which is constructing the human mind in evolution. This is the ultimate fact which raises sociology to its true position as the master science. Nor is there any materialism in such a conception. It is in keeping with the highest spiritual ideal of man that the only conception of Truth or the Absolute which the human mind can hold at present is that which is being evolved in it in relation to its own environment which is in the social process.

Authorities.—It has been one of the results of the conditions affecting sociology in the past, that many of the principal contributions to the science of society are not usually included in lists of sociological references. The following are mentioned only as indicating or suggesting others in the same classes of equal or perhaps greater importance. The dates given are usually those of the first edition of a work.

Introductory.—Darwin, *Origin of Species* (1859); *Descent of Man*, 1871 (chapters dealing with society), Wallace, *Darwinism* (1889); Romanes, *Darwin and after Darwin* (1892); Osborn, *From the Greeks to Darwin* (1894). *Economics, Historical.*—Ashley, *Introduction to English Economic History and Theory*, part i. (1888), part ii. (1893); Schmoller, *The Mercantile System* (1884); Roscher, *Geschichte der Nationalökonomik in Deutschland* (1874); Nys, *History of Economics* (Trans. Dryhurst, 1899). *Ethics, Historical.*—Sidgwick, *History of Ethics* (1886); Mackenzie, *Manual of Ethics* (1893); Hobhouse, *Morals in Evolution* (1906). *Primitive Society.*—Lubbock, *Origin of Civilization* (1870); Tylor, *Anthropology* (1881); Quatrefages, *Human Species* (Eng. trans. 1879); Lang, *Custom and Myth* (1884); Maine, *Ancient Law* (1861); *Early History of Institutions* (1875); *Early Law and Custom* (1883); Frazer, *Golden Bough* (1890); *Early History of the Kingship* (1905).

General.—Spencer, Synthetic Philosophy (*Principles of Biology*, *Principles of Sociology* and *Principles of Ethics*); Kidd, *Social Evolution* (1894); *Principles of Western Civilization* (1902); *Individualism and After*; *Two Principal Laws of Sociology: Bologna* (1908); Barth, *Die Philosophie der Geschichte als Sociologie* (1897); Ward, *Dynamic Sociology*; *Outlines of Sociology* (1898); Flint, *Philosophy of History in Europe* (1874); *Historical Philosophy in France* (1894); Bagehot, *Physics and Politics*; Ratzenhofer, *Die soziologische Erkenntnis* (1898); Giddings, *Principles of Sociology* (1896); Tarde, *Étude de psychologie sociale* (1898); Stuckenberg, *Introduction to the Study of Sociology* (1898); Stephen, *The English Utilitarians* (1900); J. S. Mill, *System of Logic* (1843); *On Liberty* (1859); *Utilitarianism* (1861); Comte, *Philosophie positive* (6 vols., 1830–1842, Eng. trans., condensed by Martineau, in 2 vols.; Baldwin, *Social Psychology*; Ritchie, *Natural Rights* (1895); Bluntschli, *The Theory of the State* (Eng. trans. 1892); Wright, *Outline of Practical Sociology* (1899); Sidgwick, *Methods of Ethics* (1874); *Elements of Politics* (1901); *Philosophy, its Scope* (1902); Taylor, *The Problem of Conduct* (1901); Kant, *Critique of Pure Reason* (particularly 2nd Division), and *Prolegomena to any Future Metaphysic*; McDougall, *An Introduction to Social Psychology* (1908); Schiller, *Studies in Humanism* (1907); James, *Pragmatism* (1907); Fairbanks, *Introduction to Sociology* (1896); Pollock, *History of the Science of Politics* (1890); Maine, *Popular Government* (1885); Morley, *Rousseau* (1873); *Diderot and the Encyclopaedists* (1878); *Burke* (1879); Austin, *Theory of Jurisprudence* (1861–1863); Holland, *Elements of Jurisprudence* (parts i., iii. and iv., 1880); *Studies in International Law* (1898); Westlake, *International Law* (1894); Bentham, *Principles of Morals and Legislation* (1789), Oxf. ed., 1879; Sohm, *Institutes of Roman Law*; Sandars, *Institutes of Justinian*; Le Roy Beaulieu, *L'État moderne et ses fonctions*; Huxley, *Evolution and Ethics* (1894); Nietzsche, *The Twilight of the Idols*; *Zarathustra*; Loria, *Les Bases économiques de la constitution sociale* (French trans.); Pearson, *National Life and Character* (1893); Vincent, *The Social Mind in Education* (1897); Marx, *Kapital* (1867, Eng. trans. 1887); Engels, *Socialism, Utopian and Scientific* (Eng. trans., Aveling, 1892); Kirkup, *An Inquiry into Socialism* (1907); George, *Progress and Poverty*; Mazel, *La Synergie sociale* (1896); Mallock, *Aristocracy and Evolution* (1898); Ross, *Social Control* (1901); Mackenzie, *Social Philosophy* (1895); Hobson, *The Social Problem* (1901); *Fabian Essays*; Rousseau, *Social Contract*; Hobbes, *Leviathan*; Locke, *Two Treatises of Government*; Webbs, *Industrial Democracy* (1897); *History of Trades Unionism* (1894); Booth, *Life and Labour of the People* (1891–1897); Patten, *The Theory of Prosperity* (1902); Wallas, *Human Nature in Politics* (1908); Urwick, *Luxury and Waste* (1908); Small, *The Scope of Sociology* (1902). (B. K.*)

SOCRATES, son of the statuary Sophroniscus and of the midwife Phaenarete, was born at Athens, not earlier than 471 nor later than May or June 469 B.C. As a youth he received the customary instruction in gymnastics and music; and in after years he made himself acquainted with geometry and astronomy and studied the methods and the doctrines of the leaders of Greek thought and culture. He began life as a sculptor; and in the 2nd century A.D. a group of the Graces, supposed to be his work, was still to be seen on the road to the Acropolis. But he soon abandoned art and gave himself to what may best be called education, conceiving that he had a divine commission, witnessed by oracles, dreams and signs, not indeed to teach any positive doctrine, but to convict men of ignorance mistaking itself for knowledge, and by so doing to promote their intellectual and moral improvement. He was on terms of intimacy with some of the most distinguished of his Athenian contemporaries, and, at any rate in later life, was personally known to very many of his fellow citizens. His domestic relations were, it is said, unhappy. The shrewishness of his wife Xanthippe became proverbial with the ancients, as it still is with ourselves. Aristotle, in his remarks upon genius and its degeneracy (*Rhet.* ii. 15), speaks of Socrates's sons as dull and fatuous; and in Xenophon's *Memorabilia*, one of them, Lamprocles, receives a formal rebuke for undutiful behaviour towards his mother.

Socrates served as a hoplite at Potidaea (432–429), where on one occasion he saved the life of Alcibiades, at Delium (424), and at Amphipolis (422). In these campaigns his bravery and endurance were conspicuous. But, while he thus performed the ordinary duties of a Greek citizen with credit, he neither attained nor sought political position. His "divine voice," he said, had warned him to refrain from politics, presumably because office would have entailed the sacrifice of his principles and the abandonment of his proper vocation. Yet in 406 he was a member of the senate; and on the first day of the trial of the victors of Arginusae, being president of the prytanis, he resisted—first, in conjunction with his colleagues, afterwards, when they yielded, alone—the illegal and unconstitutional proposal of Callixenus, that the fate of the eight generals should be decided by a single vote of the assembly. Not less courageous than this opposition to the "civium ardor prava jubentium" was his disregard of the "vultus instantis tyranni" two years later. During the reign of terror of 404 the Thirty, anxious to implicate in their crimes men of repute who might otherwise have opposed their plans, ordered five citizens, one of whom was Socrates, to go to Salamis and bring thence their destined victim Leon. Socrates alone disobeyed. But, though he was exceptionally obnoxious to the Thirty—as appears, not only in this incident, but also in their threat of punishment under a special ordinance forbidding "the teaching of the art of argument"—it was reserved for the reconstituted democracy to bring him to trial and to put him to death. In 399, four years after the restoration and the amnesty, he was indicted as an offender against public morality. His accusers were Meletus the poet, Anytus the tanner and Lycon the orator, all of them members of the democratic or patriot party who had returned from Phyle with Thrasybulus. The accusation ran thus: "Socrates is guilty, firstly, of denying the gods recognized by the state and introducing new divinities, and, secondly, of corrupting the young." In his unpremeditated defence, so far from seeking to conciliate his judges, Socrates defied them. He was found guilty by 280 votes, it is supposed, against 220. Meletus having called for capital punishment, it now rested with the accused to make a counter-proposition; and there can be little doubt that, had Socrates without further remark suggested some smaller but yet substantial penalty, the proposal would have been accepted. But, to the amazement of the judges and the distress of his friends, Socrates proudly declared that for the services which he had rendered to the city he deserved, not punishment, but the reward of a public benefactor—maintenance in the Prytaneum at the cost of the state; and, although at the close of his speech he professed himself willing to pay a fine of one mina, and upon the urgent entreaties of his friends raised the amount of his offer to thirty minas, he made no attempt to disguise his indifference to the result. His attitude exasperated the judges, and the penalty of death was decreed by an increased majority. Then in a short address Socrates declared his contentment with his own conduct and with the sentence. Whether death was a dreamless sleep, or a new life in Hades, where he would have opportunities of testing the wisdom of the heroes and the sages of antiquity, in either case he esteemed it a gain to die. In the same spirit he refused to take advantage of a scheme arranged by his friend Crito for an escape from prison. Under ordinary circumstances the condemned criminal drank the cup of hemlock on the day after the trial; but in the case of Socrates the rule that during the absence of the sacred ship sent annually to Delos no one should be put to death caused an exceptional delay. For thirty days he remained in imprisonment, receiving his intimates and conversing with them in his accustomed manner. How in his last conversation he argued that the wise man will regard approaching death with a cheerful confidence Plato relates in the *Phaedo*; and, while the central argument—which rests the doctrine of the soul's immortality upon the theory of ideas—must be accounted Platonic, in all other respects the narrative, though not that of an eye-witness, has the air of accuracy and truth.

Happily, though Socrates left no writings behind him, and indeed, as will hereafter appear, was by his principles precluded from dogmatic exposition, we have in the Ἀπομνημονεύματα or *Memoirs* and other works of Xenophon records of Socrates's conversation, and in the dialogues of Plato refined applications of his method. Xenophon, having no philosophical views of his own to develop, and no imagination to lead him astray—being, in fact, to Socrates what Boswell was to Johnson—is an excellent witness. The Ἀπομνημονεύματα or *Memorabilia* are indeed confessedly apologetic, and it is easy to see that nothing is introduced which might embitter those who, hating Socrates, were ready to persecute the Socratics; but the plain, straightforward narrative of Socrates's talk, on many occasions, with many dissimilar interlocutors, carries with it in its simplicity and congruity the evidence of substantial justice and truth. Plato, though he understood his master better, is a less trustworthy authority, as he makes Socrates the mouthpiece of his own more advanced and even antagonistic doctrine. Yet to all appearance the *Apology* is a careful and exact account of Socrates's habits and principles of action; the earlier dialogues, those which are commonly called "Socratic," represent, with such changes only as are necessitated by their form, Socrates's method; and, if in the later and more important dialogues the doctrine is the doctrine of Plato, echoes of the master's teaching are still discoverable, approving themselves as such by their accord with the Xenophontean testimony. In the face of these two principal witnesses other evidence is of small importance.

Personal Characteristics.—What, then, were the personal characteristics of the man? Outwardly his presence was mean and his countenance grotesque. Short of stature, thick-necked and somewhat corpulent, with prominent eyes, with nose upturned and nostrils outspread, with large mouth and coarse lips, he seemed the embodiment of sensuality and even stupidity. Inwardly he was, as his friends knew, "so pious that he did nothing without taking counsel of the gods, so just that he never did an injury to any man, whilst he was the benefactor of his associates, so temperate that he never preferred pleasure to right, so wise that in judging of good and evil he was never at fault—in a word, the best and the happiest of men." "His self-control was absolute; his powers of endurance were unfailing; he had so schooled himself to moderation that his scanty means satisfied all his wants." "To want nothing," he said himself, "is divine; to want as little as possible is the nearest possible approach to the divine life"; and accordingly he practised temperance and self-denial to a degree which some thought ostentatious and affected. Yet the hearty enjoyment of social pleasures was another of his marked characteristics; for to abstain from innocent gratification from fear of falling into excess would have seemed to him to imply a pedantic formalism or a lack of self-control. In short, his strength of will, if by its very perfection it led to his theoretical identification of virtue and knowledge, secured him in practice against the ascetic extravagances of his associate Antisthenes.

The intellectual gifts of Socrates were hardly less remarkable than his moral virtues. Naturally observant, acute, and thoughtful, he developed these qualities by constant and systematic use. The exercise of the mental powers was, he conceived, no mere occupation of leisure hours, but rather a sacred and ever-present duty; because, moral error being intellectual error translated into act, he who would live virtuously must first rid himself of ignorance and folly. He had, it may be conjectured, but little turn for philosophical speculation; yet by the careful study of the ethical problems which met him in himself and in others he acquired a remarkable tact in dealing with questions of practical morality; and in the course of the lifelong war which he waged against vagueness of thought and laxity of speech he made himself a singularly apt and ready reasoner.

While he regarded the improvement, not only of himself but also of others, as a task divinely appointed to him, there was in his demeanour nothing exclusive or pharisaical. On the contrary, deeply conscious of his own limitations and infirmities, he felt and cherished a profound sympathy with erring humanity, and loved with a love passing the love of women fellow men who had not learnt, as he had done, to overcome human frailties and weaknesses. Nevertheless great wrongs roused in him a righteous indignation which sometimes found expression in fierce and angry rebuke. Indeed it would seem that Plato in his idealized portrait gives his hero credit not only for a deeper philosophical insight but also for a greater urbanity than facts warranted. Hence, whilst those who knew him best met his affection with a regard equal to his own, there were, as will be seen hereafter, some who never forgave his stern reproofs, and many who regarded him as an impertinent busybody.

He was a true patriot. Deeply sensible of his debt to the city in which he had been born and bred, he thought that in giving his life to the teaching of sounder views in regard to ethical and political subjects he made no more than an imperfect return; and, when in the exercise of constitutional authority that city brought him to trial and threatened him with death, it was not so much his local attachment, strong though that sentiment was, as rather his sense of duty, which forbade him to retire into exile before the trial began, to acquiesce in a sentence of banishment when the verdict had been given against him, and to accept the opportunity of escape which was offered him during his imprisonment. Yet his patriotism had none of the narrowness which was characteristic of the patriotism of his Greek contemporaries. His generous benevolence and unaffected philanthropy taught him to overstep the limits of the Athenian demus and the Hellenic race, and to regard himself as a "citizen of the world."

He was blest with an all-pervading humour, a subtle but kindly appreciation of the incongruities of human nature and conduct. In a less robust character this quality might have degenerated into sentimentality or cynicism; in Socrates, who had not a trace of either, it showed itself principally in what his contemporaries knew as his "accustomed irony." Profoundly sensible of the inconsistencies of his own thoughts and words and actions, and shrewdly suspecting that the like inconsistencies were to be found in other men, he was careful always to place himself upon the standpoint of ignorance and to invite others to join him there, in order that, proving all things, he and they might hold fast that which is good. "Intellectually the acutest man of his age," says W. H. Thompson in a brilliant and instructive appendix to his edition of Plato's *Phaedrus*, "he represents himself in all companies as the dullest person present. Morally the purest, he affects to be the slave of passion, and borrows the language of gallantry to describe a benevolence too exalted for the comprehension of his contemporaries. He is by turns an ἐραστής, a προαγωγός, a μαστροπός, a μαιευτικός, disguising the sanctity of his true vocation by names suggestive of vile or ridiculous images. The same spirit of whimsical paradox leads him, in Xenophon's *Banquet*, to argue that his own satyr-like visage was superior in beauty to that of the handsomest man present. That this irony was to some extent calculated is more than probable; it disarmed ridicule by anticipating it; it allayed jealousy and propitiated envy; and it possibly procured him admission into gay circles from which a more solemn teacher would have been excluded. But it had for its basis a real greatness of soul, a hearty and unaffected disregard of public opinion, a perfect disinterestedness, an entire abnegation of self. He made himself a fool that others by his folly might be made wise; he humbled himself to the level of those among whom his work lay that he might raise some few among them to his own level; he was 'all things to all men, if by any means he might win some.'" It would seem that this humorous depreciation of his own great qualities, this pretence of being no better than his neighbours, led to grave misapprehension amongst his contemporaries. That it was the foundation of the slanders of the Peripatetic Aristoxenus can hardly be doubted.

Socrates was further a man of sincere and fervent piety. "No one," says Xenophon, "ever knew of his doing or saying anything profane or unholy." There was indeed in the popular mythology much which he could not accept. It was incredible, he argued, that the gods should have committed acts which would be disgraceful in the worst of men. Such stories, then, must be regarded as the inventions of lying poets. But, when he had thus purified the contemporary polytheism, he was able to reconcile it with his own steadfast belief in a Supreme Being, the intelligent and beneficent Creator of the universe, and to find in the national ritual the means of satisfying his religious aspirations. For proof of the existence of "the divine," he appealed to the providential arrangement of nature, to the universality of the belief, and to the revelations and warnings which are given to men through signs and oracles. Thinking that the soul of man partook of the divine, he maintained the doctrine of its immortality as an article of faith, but not of knowledge. While he held that, the gods alone knowing what is for man's benefit, man should pray, not for particular goods, but only for that which is good, he was regular in prayer and punctual in sacrifice. He looked to oracles and signs for guidance in those matters, and in those matters only, which could not be resolved by experience and judgment, and he further supposed himself to receive special warnings of a mantic character through what he called his "divine sign" (δαιμόνιον, δαιμόνιον σημεῖον).

Socrates's frequent references to his "divine sign" were, says Xenophon, the origin of the charge of "introducing new divinities" brought against him by his accusers, and in early Christian times, amongst Neoplatonic philosophers and fathers of the church, gave rise to the notion that he supposed himself to be attended by a "genius" or "daemon." Similarly in our own day spiritualists have attributed to him the belief—which they justify—in "an intelligent spiritual being who accompanied him through life—in other words, a guardian spirit" (A. R. Wallace). But the very precise testimony of Xenophon and Plato shows plainly that Socrates did not regard his "customary sign" either as a divinity or as a genius. According to Xenophon, the sign was a warning, either to do or not to do, which it would be folly to neglect, not superseding ordinary prudence, but dealing with those uncertainties in respect of which other men found guidance in oracles and tokens; Socrates believed in it profoundly, and never disobeyed it. According to Plato, the sign was a "voice" which warned Socrates to refrain from some act which he contemplated; he heard it frequently and on the most trifling occasions; the phenomenon dated from his early years, and was, so far as he knew, peculiar to himself. These statements have been variously interpreted. Thus it has been maintained that, in laying claim to supernatural revelations, Socrates (1) committed a pious fraud, (2) indulged his "accustomed irony," (3) recognized the voice of conscience, (4) indicated a general belief in a divine mission, (5) described "the inward voice of his individual tact, which in consequence partly of his experience and penetration, partly of his knowledge of himself and exact appreciation of what was in harmony with his individuality, had attained to an unusual accuracy," (6) was mad ("étaitfou"), being subject not only to hallucinations of sense but also to aberrations of reason. Xenophon's testimony that Socrates was plainly sincere in his belief excludes the first and second of these theories; the character of the warnings given, which are always concerned, not with the moral worth of actions, but with their uncertain results, warrants the rejection of the third and the fourth; the fifth, while it sufficiently accounts for the matter of the warning, leaves unexplained its manner, the vocal utterance; the sixth, while it plausibly explains the manner of the warning, goes beyond the facts when it attributes to it irrationality of matter. It remains for us, then, modifying the fifth hypothesis, that of Diderot, Zeller and others, and the sixth, that of Lélut and Littré, and combining the two, to suppose that Socrates was subject, not indeed to delusions of mind, but to hallucinations of the sense of hearing, so that the rational suggestions of his own brain, exceptionally valuable in consequence of the accuracy and delicacy of his highly cultivated tact, seemed to him to be projected without him, and to be returned to him through the outward ear. It appears that, though in some of the best known instances—for example, those of Cowper and Sidney Walker—hallucinations of the sense of hearing, otherwise closely resembling Socrates's "divine sign," have been accompanied by partial derangement of reason, cases are not wanting in which "the thoughts transformed into external sensorial impressions" are perfectly rational.

The eccentricity of Socrates's life was not less remarkable than the oddity of his appearance and the irony of his conversation. His whole time was spent in public—in the market-place, the streets, the gymnasia. Thinking with Dr Johnson that "a great city is the school for studying life," he had no liking for the country, and seldom passed the gates. "Fields and trees," Plato makes him say, "will not teach me anything; the life of the streets will." He talked to all comers—to the craftsman and the artist as willingly as to the poet or the politician—questioning them about their affairs, about the processes of their several occupations, about their notions of morality, in a word, about familiar matters in which they might be expected to take an interest. The ostensible purpose of these interrogatories was to test, and thus either refute or explain, the famous oracle which had pronounced him the wisest of men. Conscious of his own ignorance, he had at first imagined that the god was mistaken. When, however, experience showed that those who esteemed themselves wise were unable to give an account of their knowledge, he had to admit that, as the oracle had said, he was wiser than others, in so far as, whilst they, being ignorant, supposed themselves to know, he, being ignorant, was aware of his ignorance. Such, according to the *Apology*, was Socrates's account of his procedure and its results. But it is easy to see that the statement is coloured by the accustomed irony. When in the same speech Socrates tells his judges that he would never from fear of death or from any other motive disobey the command of the god, and that, if they put him to death, the loss would be, not his, but theirs, since they would not readily find any one to take his place, it becomes plain that he conceived himself to hold a commission to educate, and was consciously seeking the intellectual and moral improvement of his countrymen. His end could not be achieved without the sacrifice of self. His meat and drink were of the poorest; summer and winter his coat was the same; he was shoeless and shirtless. "A slave whose master made him live as you live," says a sophist in the *Memorabilia*, "would run away." But by the surrender of the luxuries and the comforts of life Socrates secured for himself the independence which was necessary that he might go about his appointed business, and therewith he was content.

Mode of Life.

His message was to all, but it was variously received. Those who heard him perforce and occasionally were apt to regard his teaching either with indifference or with irritation,—with indifference, if, as might be, they failed to see in the elenchus anything more than elaborate trifling; with irritation, if, as was probable, they perceived that, in spite of his assumed ignorance, Socrates was well aware of the result to which their enforced answers tended. Amongst

Contemporary Judgments.

those who deliberately sought and sedulously cultivated his acquaintance there were some who attached themselves to him as they might have attached themselves to any ordinary sophist, conceiving that by temporary contact with so acute a reasoner they would best prepare themselves for the logomachies of the law courts, the assembly and the senate. Again, there were others who saw in Socrates at once master, counsellor and friend, and hoped by associating with him "to become good men and true, capable of doing their duty by house and household, by relations and friends, by city and fellow-citizens" (Xenophon). Finally, there was a little knot of intimates who, having something of Socrates's enthusiasm, entered more deeply than the rest into his principles, and, when he died, transmitted them to the next generation. Yet even those who belonged to this inner circle were united, not by any common doctrine, but by a common admiration for their master's intellect and character.

For, the paradoxes of Socrates's personality and the eccentricity of his behaviour, if they offended the many, fascinated the few.

Plato's Panegyric. "It is not easy for a man in my condition," says the intoxicated Alcibiades in Plato's *Symposium*, "to describe the singularity of Socrates's character. But I will try to tell his praises in similitudes. He is like the piping Silenes in the statuaries' shops, which, when you open them, are found to contain images of gods. Or, again, he is like the satyr Marsyas, not only in outward appearance—that, Socrates, you will yourself allow—but in other ways also. Like him, you are given to frolic—I can produce evidence to that; and above all, like him, you are a wonderful musician. Only there is this difference—what he does with the help of his instrument you do with mere words; for whatsoever man, woman or child hears you, or even a feeble report of what you have said, is struck with awe and possessed with admiration. As for myself, were I not afraid that you would think me more drunk than I am, I would tell you on oath how his words have moved me—ay, and how they move me still. When I listen to him my heart beats with a more than Corybantic excitement; he has only to speak and my tears flow. Orators, such as Pericles, never moved me in this way—never roused my soul to the thought of my servile condition; but this Marsyas makes me think that life is not worth living so long as I am what I am. Even now, if I were to listen, I could not resist. So there is nothing for me but to stop my ears against this siren's song and fly for my life, that I may not grow old sitting at his feet. No one would think that I had any shame in me; but I am ashamed in the presence of Socrates."

The Accusation and its Causes.—The life led by Socrates was not likely to win for him either the affection or the esteem of the vulgar.

Popular Prejudices. Those who did not know him personally, seeing him with the eyes of the comic poets, conceived him as a "visionary" (μετεωρολόγος) and a "bore" (ἀδολέσχης). Those who had faced him in argument, even if they had not smarted under his rebukes, had at any rate winced under his interrogatory, and regarded him in consequence with feelings of dislike and fear. But the eccentricity of his genius and the ill will borne towards him by individuals are not of themselves sufficient to account for the tragedy of 399. It thus becomes necessary to study the circumstances of the trial, and to investigate the motives which led the accusers to seek his death and the people of Athens to acquiesce in it.

The Accusation. Socrates was accused (1) of denying the gods recognized by the state and introducing instead of them strange divinities (δαιμόνια), and (2) of corrupting the young. The first of these charges rested upon the notorious fact that he supposed himself to be guided by a divine visitant or sign (δαιμόνιον). The second, Xenophon tells us, was supported by a series of particular allegations: (*a*) that he taught his associates to despise the institutions of the state, and especially election by lot; (*b*) that he had numbered amongst his associates Critias and Alcibiades, the most dangerous of the representatives of the oligarchical and democratical parties respectively; (*c*) that he taught the young to disobey parents and guardians and to prefer his own authority to theirs; (*d*) that he was in the habit of quoting mischievous passages of Homer and Hesiod to the prejudice of morality and democracy.

Strength of the Defence. It is plain that the defence was not calculated to conciliate a hostile jury. Nevertheless, it is at first sight difficult to understand how an adverse verdict became possible. If Socrates rejected portions of the conventional mythology, he accepted the established faith and performed its offices with exemplary regularity. If he talked of a δαιμόνιον, the δαιμόνιον was no new divinity, but a mantic sign divinely accorded to him, presumably by the gods of the state. If he questioned the propriety of certain of the institutions of Athens, he was prepared to yield an unhesitating obedience to all. He had never countenanced the misdeeds of Critias and Alcibiades, and indeed, by a sharp censure, had earned the undying hatred of one of them. Duty to parents he inculcated as he inculcated other virtues; and, if he made the son wiser than the father, surely that was not a fault. The citation of a few lines from the poets ought not to weigh against the clear evidence of his large-hearted patriotism; and it might be suspected that the accuser had strangely misrepresented his application of the familiar words.

Its Weakness. To the modern reader Xenophon's reply, of which the foregoing is in effect a summary, will probably seem sufficient, and more than sufficient. But it must not be forgotten that Athenians of the old school approached the subject from an entirely different point of view. Socrates was in all things an innovator—in religion, inasmuch as he sought to eliminate from the theology of his contemporaries "those lies which poets tell"; in politics, inasmuch as he distrusted several institutions dear to Athenian democracy; in education, inasmuch as he waged war against authority, and in a certain sense made each man the measure of his own actions. It is because Socrates was an innovator that we, who see in him the founder of philosophical inquiry, regard him as a great man; it was because Socrates was an innovator that old-fashioned Athenians, who saw in the new-fangled culture the origin of all their recent distresses and disasters, regarded him as a great criminal. It is, then, after all in no wise strange that a majority was found first to pronounce him guilty, and afterwards, when he refused to make any submission and professed himself indifferent to any mitigation of the penalty, to pass upon him the sentence of death. That the verdict and the sentence were not in any way illegal is generally acknowledged.

Occasion of the Attack. But, though the popular distrust of eccentricity, the irritation of individuals and groups of individuals, the attitude of Socrates himself, and the prevalent dislike of the intellectual movement which he represented, go far to account for the result of the trial, they do not explain the occasion of the attack. Socrates's oddity and brusquerie were no new things; yet in the past, though they had made him unpopular, they had not brought him into the courts. His sturdy resistance to the demos in 406 and to the Thirty in 404 had passed, if not unnoticed, at all events unpunished. His political heresies and general unorthodoxy had not caused him to be excluded from the amnesty of 403. Why was it, then, that in 399, when Socrates's idiosyncrasies were more than ever familiar, and when the constitution had been restored, the toleration hitherto extended to him was withdrawn? What were the special circumstances which induced three members of the patriot party, two of them leading politicians, to unite their efforts against one who apparently was so little formidable?

Political Reasons for it. For an answer to this question it is necessary to look to the history of Athenian politics. Besides the oligarchical party, properly so called, which in 411 was represented by the Four Hundred and in 404 by the Thirty, and the democratical party, which returned to power in 410 and in 403, there was at Athens during the last years of the Peloponnesian War a party of "moderate oligarchs," antagonistic to both. It was to secure the co-operation of the moderate party that the Four Hundred in 411 promised to constitute the Five Thousand, and that the Thirty in 404 actually constituted the Three Thousand. It was in the hope of realizing the aspirations of the moderate party that Theramenes, its most prominent representative, allied himself, first with the Four Hundred, afterwards with the Thirty. In 411 the policy of Theramenes (*q.v.*) was temporarily successful, the Five Thousand superseding the Four Hundred. In 404 the Thirty outwitted him; for, though they acted upon his advice so far as to constitute the Three Thousand, they were careful to keep all real power in their own hands. But on both occasions the "polity"—for such, in the Aristotelian sense of the term, the constitution of 411–410 was, and the constitution of 404–403 professed to be—was insecurely based, so that it was not long before the "unmixed democracy" was restored. The programme of the "moderates"—which included (1) the limitation of the franchise, by the exclusion of those who were unable to provide themselves with the panoply of a hoplite and thus to render to the city substantial service, (2) the abolition of payment for the performance of political functions, and, as it would seem, (3) the disuse of the lot in the election of magistrates—found especial favour with the intellectual class. Thus Alcibiades was amongst its promoters, and Thucydides commends the constitution established after the fall of the Four Hundred as the best which in his time Athens had enjoyed. Now it is expressly stated that Socrates disliked election by lot; it is certain that, regarding paid educational service as a species of prostitution, he would account paid political service not a whit less odious; and the stress laid by the accuser upon the Homeric quotation (*Iliad* ii. 188–202)—which ends with the lines *δαιμόνι', ἀτρέμας ἧσο, καὶ ἄλλων μῦθον ἄκουε οἳ σέο φέρτεροί εἰσι · σὺ δ' ἀπτόλεμος καὶ ἄναλκις, οὔτε ποτ' ἐν πολέμῳ ἐναρίθμιος οὔτ' ἐνὶ βουλῇ*—becomes intelligible if we may suppose that Socrates, like Theramenes, wished to restrict the franchise to those who were rich enough to serve as hoplites at their own expense. Thus, as might have been anticipated, Socrates was a "moderate," and the treatment which he received from both the extreme parties suggests—even if with Grote we reject the story told by Diodorus (xiv. 5), how, when Theramenes was dragged from the altar, Socrates attempted a rescue—that his sympathy with the moderate party was pronounced and notorious. Even in the moment of democratic triumph the "moderates" made themselves heard, Phormisius proposing that those alone should exercise the franchise who possessed land in Attica; and it is reasonable to suppose that their position was stronger in 399 than in 403. These considerations seem to indicate an easy explanation of the indictment of Socrates by the democratic politicians. It was a blow struck at the "moderates," Socrates being singled out for attack because, though not a professional politician, he was the very type of the malcontent party, and had done much, probably more than any man living, to make and to foster views which, if not in the strict sense of the term oligarchical, were confessedly hostile to the "unmixed democracy." His eccentricity and heterodoxy, as well as the personal animosities which he had provoked, doubtless contributed, as his accusers had foreseen, to bring about the conviction; but, in the judgment of the present writer, it was the fear of what may be called "philosophical radicalism" which prompted the action of Meletus, Anytus and Lycon. The result did not disappoint their expectations. The friends of Socrates abandoned the struggle and retired into exile; and, when they returned to Athens, the most prominent of them, Plato, was careful to confine himself to theory, and to announce in emphatic terms his withdrawal from the practical politics of his native city.

Method and Doctrine.—Socrates was not a "philosopher," nor yet a "teacher," but rather an "educator," having for his function "to rouse, persuade and rebuke" (Plato, *Apology*, 30 E). Hence, in examining his life's work it is proper to ask, not What was his philosophy? but What was his theory, and what was his practice, of education? It is true that he was brought to his theory of education by the study of previous philosophies, and that his practice led to the Platonic revival; but to attribute to him philosophy, except in that loose sense in which philosophy is ascribed to one who, denying the existence of such a thing, can give an account of his disbelief, is misleading and even erroneous.

Scepticism.

Socrates's theory of education had for its basis a profound and consistent scepticism; that is to say, he not only rejected the conflicting theories of the physicists—of whom "some conceived existence as a unity, others as a plurality; some affirmed perpetual motion, others perpetual rest; some declared becoming and perishing to be universal, others altogether denied such things"—but also condemned, as a futile attempt to transcend the limitations of human intelligence, their *φιλοσοφία*, their "pursuit of knowledge for its own sake." Unconsciously, or more probably consciously, Socrates rested his scepticism upon the Protagorean doctrine that man is the measure of his own sensations and feelings; whence he inferred, not only that knowledge such as the philosophers had sought, certain knowledge of nature and its laws, was unattainable, but also that neither he nor any other person had authority to overbear the opinions of another, or power to convey instruction to one who had it not. Accordingly, whereas Protagoras and others, abandoning physical speculation and coming forward as teachers of culture, claimed for themselves in this new field power to instruct and authority to dogmatize, Socrates, unable to reconcile himself to this inconsistency, proceeded with the investigation of principles until he found a resting-place, a *ποῦ στῶ*, in the distinction between good and evil. While all opinions were equally true, of those opinions which were capable of being translated into act some, he conceived, were as working hypotheses more serviceable than others. It was here that the function of such a one as himself began. Though he had neither the right nor the power to force his opinions upon another, he might by a systematic interrogatory lead another to substitute a better opinion for a worse, just as a physician by appropriate remedies may enable his patient to substitute a healthy sense of taste for a morbid one. To administer such an interrogatory and thus to be the physician of souls was, Socrates thought, his divinely appointed duty; and, when he described himself as a "talker" or "converser," he not only negatively distinguished himself from those who, whether philosophers or sophists, called themselves "teachers" (*διδάσκαλοι*), but also positively indicated the method of question and answer (*διαλεκτική*) which he consistently preferred and habitually practised.

Dialectical Method.

That it was in this way that Socrates was brought to regard "dialectic," "question and answer," as the only admissible method of education is, in the opinion of the present writer, no matter of mere conjecture. In the review of theories of knowledge which has come down to us in Plato's *Theaetetus* mention is made (172 B) of certain "incomplete Protagoreans," who held that, while all opinions are equally true, one opinion is better than another, and that the "wise man" is one who by his arguments causes good opinions to take the place of bad ones, thus reforming the soul of the individual or the laws of a state by a process similar to that of the physician or the farmer (166 D seq.); and these "incomplete Protagoreans" are identified with Socrates and the Socratics by their insistence (167 D) upon the characteristically Socratic distinction between disputation and dialectic, as well as by other familiar traits of Socratic converse. In fact, this passage becomes intelligible and significant if it is supposed to refer to the historical Socrates; and by teaching us to regard him as an "incomplete Protagorean" it supplies the link which connects his philosophical scepticism with his dialectical theory of education. It is no doubt possible that Socrates was unaware of the closeness of his relationship to Protagoras; but the fact, once stated, hardly admits of question.

Its two Processes.

In the application of the "dialectical" or "maieutic" method two processes are distinguishable—the destructive process, by which the worse opinion was eradicated, and the constructive process, by which the better opinion was induced. In general it was not mere "ignorance" with which Socrates had to contend, but "ignorance mistaking itself for knowledge" or "false conceit of wisdom"—a more stubborn and a more formidable foe, who, safe so long as he remained in his intrenchments, must be drawn from them, circumvented, and surprised. Accordingly, taking his departure from some apparently remote principle or proposition to which the respondent yielded a ready assent, Socrates would draw from it an unexpected but undeniable consequence which was plainly inconsistent with the opinion impugned. In this way he brought his interlocutor to pass judgment upon himself, and reduced him to a state of "doubt" or "perplexity" (*ἀπορία*). "Before I ever met you," says Meno in the dialogue which Plato called by his name (79 E), "I was told that you spent your time in doubting and leading others to doubt; and it is a fact that your witcheries and spells have brought me to that condition; you are like the torpedo: as it benumbs any one who approaches and touches it, so do you. For myself, my soul and my tongue are benumbed, so that I have no answer to give you." Even if, as often happened, the respondent, baffled and disgusted by the *ἔλεγχος* or destructive process, at this point withdrew from the inquiry, he had, in Socrates's judgment, gained something; for, whereas formerly, being ignorant, he had supposed himself to have knowledge, now, being ignorant, he was in some sort conscious of his ignorance, and accordingly would be for the future more circumspect in action. If, however, having been thus convinced of ignorance, the respondent did not shrink from a new effort, Socrates was ready to aid him by further questions of a suggestive sort. Consistent thinking with a view to consistent action being the end of the inquiry, Socrates would direct the respondent's attention to instances analogous to that in hand, and so lead him to frame for himself a generalization from which the passions and the prejudices of the moment were, as far as might be, excluded. In this constructive process, though the element of surprise was no longer necessary, the interrogative form was studiously preserved, because it secured at each step the conscious and responsible assent of the learner.

Maieutic in Plato and Xenophon.

Of the two processes of the dialectical method, the ἔλεγχος or destructive process attracted the more attention, both in consequence of its novelty and because many of those who willingly or unwillingly submitted to it stopped short at the stage of "perplexity." But to Socrates and his intimates the constructive process was the proper and necessary sequel. It is true that in the dialogues of Plato the destructive process is not always, or even often, followed by construction, and that in the *Memorabilia* of Xenophon construction is not always, or even often, preceded by the destructive process. There is, however, in this nothing surprising. On the one hand, Xenophon, having for his principal purpose the defence of his master against vulgar calumny, seeks to show by effective examples the excellence of his positive teaching, and accordingly is not careful to distinguish, still less to emphasize, the negative procedure. On the other hand, Plato, his aim being not so much to preserve Socrates's positive teaching as rather by written words to stimulate the reader to self-scrutiny, just as the spoken words of the master had stimulated the hearer, is compelled by the very nature of his task to keep the constructive element in the background, and, where Socrates would have drawn an unmistakable conclusion, to confine himself to enigmatical hints. For example, when we compare Xenophon's *Memorabilia*, iv. 6, 2–4, with Plato's *Euthyphro*, we note that, while in the former the interlocutor is led by a few suggestive questions to define "piety" as "the knowledge of those laws which are concerned with the gods," in the latter, though on a further scrutiny it appears that "piety" is "that part of justice which is concerned with the service of the gods," the conversation is ostensibly inconclusive. In short, Xenophon, a mere reporter of Socrates's conversations, gives the results, but troubles himself little about the steps which led to them; Plato, who in early manhood was an educator of the Socratic type, withholds the results that he may secure the advantages of the elenctic stimulus.

Induction and Definition.

What, then, were the positive conclusions to which Socrates carried his hearers? and how were those positive conclusions obtained? Turning to Xenophon for an answer to these questions, we note (1) that the recorded conversations are concerned with practical action, political, moral, or artistic; (2) that in general there is a process from the known to the unknown through a generalization, expressed or implied; (3) that the generalizations are sometimes rules of conduct, justified by examination of known instances, sometimes definitions similarly established. Thus, in *Memorabilia*, iv. 1, 3, Socrates argues from the known instances of horses and dogs that, the best natures stand most in need of training, and then applies the generalization to the instance under discussion, that of men; and in iv. 6, 13–14, he leads his interlocutor to a definition of "the good citizen," and then uses it to decide between two citizens for whom respectively superiority is claimed. Now in the former of these cases the process—which Aristotle would describe as "example" (παράδειγμα), and a modern might regard as "induction" of an uncritical sort—sufficiently explains itself. The conclusion is a provisional assurance that in the particular matter in hand a certain course of action is, or is not, to be adopted. But it is necessary to say a word of explanation about the latter case, in which, the generalization being a definition, that is to say, a declaration that to a given term the interlocutor attaches in general a specified meaning, the conclusion is a provisional assurance that the interlocutor may, or may not, without falling into inconsistency, apply the term in question to a certain person or act. Moral error, Socrates conceived, is largely due to the misapplication of general terms, which, once affixed to a person or to an act, possibly in a moment of passion or prejudice, too often stand in the way of sober and careful reflection. It was in order to exclude error of this sort that Socrates insisted upon τὸ ὁρίζεσθαι καθόλου with ἐπακτικοὶ λόγοι for its basis. By requiring a definition and the reference to it of the act or person in question, he sought to secure in the individual at any rate consistency of thought, and, in so far, consistency of action. Accordingly he spent his life in seeking and helping others to seek "the what" (τὸ τί), or the definition, of the various words by which the moral quality of actions is described, valuing the results thus obtained not as contributions to knowledge, but as means to right action in the multifarious relations of life.

Virtue is Knowledge.

While, however, Socrates sought neither knowledge, which in the strict sense of the word he held to be unattainable, nor yet, except as a means to right action, true opinion, the results of observation accumulated until they formed, not perhaps a system of ethics, but at any rate a body of ethical doctrine. Himself blessed with a will so powerful that it moved almost without friction, he fell into the error of ignoring its operations, and was thus led to regard knowledge as the sole condition of well-doing. Where there is knowledge—that is to say, practical wisdom (φρόνησις), the only knowledge which he recognized—right action, he conceived, follows of itself; for no one knowingly prefers what is evil; and, if there are cases in which men seem to act against knowledge, the inference to be drawn is, not that knowledge and wrongdoing are compatible, but that in the cases in question the supposed knowledge was after all ignorance. Virtue, then, is knowledge, knowledge at once of end and of means, irresistibly realizing itself in act. Whence it follows that the several virtues which are commonly distinguished are essentially one. "Piety," "justice," "courage" and "temperance" are the names which "wisdom" bears in different spheres of action: to be pious is to know what is due to the gods; to be just is to know what is due to men; to be courageous is to know what is to be feared and what is not; to be temperate is to know how to use what is good and avoid what is evil. Further, inasmuch as virtue is knowledge, it can be acquired by education and training, though it is certain that one soul has by nature a greater aptitude than another for such acquisition.

Theory of the Good.

But, if virtue is knowledge, what has this knowledge for its object? To this question Socrates replies, Its object is the Good. What, then, is the Good? It is the useful, the advantageous. Utility, the immediate utility of the individual, thus becomes the measure of conduct and the foundation of all moral rule and legal enactment. Accordingly, each precept of which Socrates delivers himself is recommended on the ground that obedience to it will promote the pleasure, the comfort, the advancement, the well-being of the individual; and Prodicus's apologue of the Choice of Heracles, with its commonplace offers of worldly reward, is accepted as an adequate statement of the motives of virtuous action. Of the graver difficulties of ethical theory Socrates has no conception, having, as it would seem, so perfectly absorbed, the lessons of what Plato calls "political virtue" that morality has become with him a second nature, and the scrutiny of its credentials from an external standpoint has ceased to be possible. His theory is indeed so little systematic that, whereas, as has been seen, virtue or wisdom has the Good for its object, he sometimes identifies the Good, with virtue or wisdom, thus falling into the error which Plato (*Republic* vi. 505 C), perhaps with distinct reference to Socrates, ascribes to certain "cultivated thinkers." In short, the ethical theory of Socrates, like the rest of his teaching, is by confession unscientific; it is the statement of the convictions of a remarkable nature, which statement emerges in the course of an appeal to the individual to study consistency in the interpretation of traditional rules of conduct. For a critical examination of the ethical teaching which is here described in outline, see Ethics.

The Socratics.

Socratic Schools.

It has been seen that, so far from having any system, physical or metaphysical, to enunciate, Socrates rejected "the pursuit of knowledge for its own sake" as a delusion and a snare,—a delusion, inasmuch as knowledge, properly so called, is unattainable, and a snare, in so far as the pursuit of it draws us away from the study of conduct. He has therefore no claim to be regarded as the founder of a philosophical school. But he had made some tentative contributions to a theory of morality; he had shown both in his life and in his death that his principles stood the test of practical application; he had invented a method having for its end the rectification of opinion; and, above all, he had asserted "the autonomy of the individual intellect." Accordingly, not one school but several schools sprang up amongst his associates, those of them who had a turn for speculation taking severally from his teaching so much as their pre-existing tendencies and convictions allowed them to assimilate. Thus Aristippus of Cyrene interpreted hedonistically the theoretical morality; Antisthenes the Cynic copied and caricatured the austere example; Euclides of Megara practised and perverted the elenctic method; Plato the Academic, accepting the whole of the Socratic teaching, first developed it harmoniously in the sceptical spirit of its author, and afterwards, conceiving that he had found in Socrates's agnosticism the germ of a philosophy, proceeded to construct a system which should embrace at once ontology, physics, and ethics. From the four schools thus established sprang subsequently four other schools,—the Epicureans being the natural successors of the Cyrenaics, the Stoics of the Cynics, the Sceptics of the Megarians, and the Peripatetics of the Academy. In this way the teaching of Socrates made itself felt throughout the whole of the post-Socratic philosophy. Of the influence which he exercised upon Aristippus, Antisthenes and Euclides, the "incomplete Sociatics," as they are commonly called, as well as upon the "complete Socratic," Plato, something must now be said.

Incomplete Socratics.

The "incomplete Socratics" were, like Socrates, sceptics; but, whereas Aristippus, who seems to have been in contact with Protagoreanism before he made acquaintance with Socrates, came to scepticism, as Protagoras had done, from the standpoint of the pluralists, Antisthenes, like his former master Gorgias, and Euclides, in whom the ancients rightly saw a successor of Zeno, came to scepticism from the standpoint of Eleatic henism. In other words, Aristippus was sceptical because, taking into account the subjective element in sensation, he found himself compelled to regard what are called "things" as successions of feelings, which feelings are themselves absolutely distinct from one another; while Antisthenes and Euclides were sceptical because, like Zeno, they did not understand how the same thing could at the same moment bear various and inconsistent epithets, and consequently conceived all predication which was not identical to be illegitimate. Thus Aristippus recognized only feelings, denying things; Antisthenes recognized things, denying attributions; and it is probable that in this matter Euclides was at one with him. For, though since Schleiermacher many historians, unnecessarily identifying the εἰδῶν φίλοι of Plato's *Sophist* with the Megarians, have ascribed to Euclides a theory of "ideas," and on the strength of this single passage thus conjecturally interpreted have added a new chapter to the history of Megarianism, it is difficult, if not impossible, to see how, if the founder of the school had broken loose from the trammels of the Zenonian paradox, his successors, and amongst them Stilpo, should have reconciled themselves, as they certainly did, to the Cynic denial of predication.

While the "incomplete Socratics" made no attempt to overpass the limits which Socrates had imposed upon himself, within those limits they occupied each his department. Aristippus, a citizen of the world, drawn to Athens by the fame of Socrates, and retained there by the sincere affection which he conceived for him, interpreted the ethical doctrine of Socrates in accordance with his own theory of pleasure, which in its turn came under the refining influence of Socrates's, theory of φρόνησις. Contrariwise, Antisthenes, a rugged but not ungenerous nature, a hater of pleasure, troubled himself little about ethical theory and gave his life to the imitation of his master's asceticism. Virtue, he held, depended upon "works," not upon arguments or lessons; all that was necessary to it was the strength of a Socrates (Diog. Laërt. vi. 11). Yet here too the Socratic theory of φρόνησις had a qualifying effect; so that Cyrenaic hedonism and Cynic asceticism sometimes exhibit unexpected approximations. The teaching of Euclides, though the Good is still supposed to be the highest object of knowledge, can hardly be said to have an ethical element; and in consequence of this deficiency the dialectic of Socrates degenerated in Megarian hands, first into a series of exercises in fallacies, secondly into a vulgar and futile eristic. In fact, the partial Socraticisms of the incomplete Socratics necessarily suffered, even within their own narrow limits, by the dismemberment which the system had undergone. Apparently the maieutic theory of education was not valued by any of the three; and, however this may be, they deviated from Socratic tradition so far as to establish schools, and, as it would seem, to take fees like the professional educators called Sophists.

Plato's Metaphysical Theories.

Of the relations in which the metaphysic of Plato stood to the Socratic search for definitions there are of necessity almost as many theories as there are interpretations of the Platonic system. Hence in this place the writer must content himself with a summary statement of his own views. Initiated into philosophical speculation by the Heraclitean Cratylus, Plato began his intellectual life as an absolute sceptic, the followers of Heraclitus having towards the end of the 5th century pushed to its conclusion the unconscious scepticism of their master. There would have been then nothing to provoke surprise, if, leaving speculation, Plato had given himself to politics. In 407, however, he became acquainted with Socrates, who gave to his thoughts a new direction. Plato now found an occupation for his intellectual energies, as Socrates had done, in the scrutiny of his beliefs and the systematization of his principles of action. But it was not until the catastrophe of 399 that Plato gave himself to his life's work. An exile, cut off from political ambitions, he came forward as the author of dialogues which aimed at producing upon readers the same effect which the voice of the master had produced upon hearers. For a time he was content thus to follow in the steps of Socrates, and of this period we have records in those dialogues which are commonly designated Socratic. But Plato had too decided a bent for metaphysics to linger long over propaedeutic studies. Craving knowledge—not merely provisional and subjective knowledge of ethical concepts, such as that which had satisfied Socrates, but knowledge of the causes and laws of the universe, such as that which the physicists had sought—he asked himself what was necessary that the "right opinion" which Socrates had obtained by abstraction from particular instances might be converted into "knowledge" properly so called. In this way Plato was led to assume for every Socratic universal a corresponding unity, eternal, immutable, suprasensual, to be the cause of those particulars which are called by the common name. On this assumption the Socratic definition or statement of the "what" of the universal, being obtained by the inspection of particulars, in some sort represented the unity, form, or "idea" from which they derived their characteristics, and in so far was valuable; but, inasmuch as the inspection of the particulars was partial and imperfect, the Socratic definition was only a partial and imperfect representation of the eternal, immutable, suprasensual, idea. How, then, was the imperfect representation of the idea to be converted into a perfect representation? To this question Plato's answer was vague and tentative. By constant revision of the provisional definitions which imperfectly represented the ideas he hoped to bring them into such shapes that they should culminate in the definition of the supreme principle, the Good, from which the ideas themselves derive their being. If in this way we could pass from uncertified general notions, reflections of ideas, to the Good, so as to be able to say, not only that the Good causes the ideas to be what they are, but also that the Good causes the ideas to be what we conceive them, we might infer, he thought, that our definitions, hitherto provisional, are adequate representations of real existences. But the Platonism of this period had another ingredient. It has been seen that the Eleatic Zeno had rested his denial of plurality upon certain supposed difficulties of predication, and that they continued to perplex Antisthenes as well as perhaps Euclides and others of Plato's contemporaries. These difficulties must be disposed of, if the new philosophy was to hold its ground; and accordingly, to the fundamental assertion of the existence of eternal immutable ideas, the objects of knowledge, Plato added two subordinate propositions, namely, (1) "the idea is immanent in the particular," and (2) "there is an idea wherever a plurality of particulars is called by the same name." Of these propositions the one was intended to explain the attribution of various and even inconsistent epithets to the same particular at the same time, whilst the other was necessary to make this explanation available in the case of common terms other than the Socratic universals. Such was the Platonism of the *Republic* and the *Phaedo*, a provisional ontology, with a scheme of scientific research, which, as Plato honestly confessed, was no more than an unrealized aspiration. It was the non-Socratic element which made the weakness of this, the earlier, theory of ideas. Plato soon saw that the hypothesis of the idea's immanence in particulars entailed the sacrifice of its unity, whilst as a theory of predication that hypothesis was insufficient, because applicable to particulars only, not to the ideas themselves. But with clearer views about relations and negations the paradox of Zeno ceased to perplex; and with the consequent withdrawal of the two supplementary articles the development of the fundamental assumption of ideas, eternal, immutable, suprasensual, might be attempted afresh. In the more definite theory which Plato now propounded the idea was no longer a Socratic universal perfected and hypostatized, but rather the perfect type of a natural kind, to which type its imperfect members were related by imitation, whilst this relation was metaphysically explained by means of a "thoroughgoing idealism" (R. D. Archer-Hind). Thus, whereas in the earlier theory of ideas the ethical universals of Socrates had been held to have a first claim to hypostatization in the world of ideas, they are now peremptorily excluded, whilst the idealism which reconciles plurality and unity gives an entirely new significance to so much of the Socratic element as is still retained.

Plato's Ethical Theories.

The growth of the metaphysical system necessarily influenced Plato's ethical doctrines; but here his final position is less remote from that of Socrates. Content in the purely Socratic period to elaborate and to record ethical definitions such as Socrates himself might have propounded, Plato, as soon as the theory of ideas offered itself to his imagination, looked to it for the foundation of ethics as of all other sciences. Though in the earlier ages both of the individual and of the state a sound utilitarian morality of the Socratic sort was useful, nay valuable, the morality of the future should, he thought, rest upon the knowledge of the Good. Such is the teaching of the *Republic*. But with the revision of the metaphysical system came a complete change in the view which Plato took of ethics and its prospects. Whilst in the previous period it had ranked as the first of sciences, it was now no longer a science; because, though Good absolute still occupied the first place, Good relative and all its various forms—justice, temperance, courage, wisdom—not being ideas, were incapable of being "known." Hence it is that the ethical teaching of the later dialogues bears an intelligible, though perhaps unexpected, resemblance to the simple practical teaching of the unphilosophical Socrates.

Yet throughout these revolutions of doctrine Plato was ever true to the Socratic theory of education. His manner indeed changed; for, whereas in the earlier dialogues the characteristics of the master are studiously and skilfully preserved, in the later dialogues Socrates first becomes metaphysical, then ceases to be protagonist, and at last disappears from the scene. But in the later dialogues, as in the earlier, Plato's aim is the aim which Socrates in his conversation never lost sight of, namely, the dialectical improvement of the learner.

Bibliography.—Of the histories of Greek philosophy the most convenient for the study of Socrates's life and work is Zeller's *Philosophie d. Griechen*. The part in question has been translated into English under the title of *Socrates and the Socratic Schools* (London, 1877). For a list of special treatises, see Ueberweg in his *Grundriss d. Geschichte d. Philosophie*. The following sources of information may be specially mentioned: F. Schleiermacher, "Ueber d. Werth d. Sokrates als Philosophen," in *Abh. d. berliner Akad. d. Wissensch.* (1815) and *Werke*, iii. 2, 287–308, translated into English by C. Thirlwall in the *Philological Museum* (Cambridge, 1833), ii. 538–555; L. F. Lélut, *Du Démon de Socrate* (Paris, 1836, 1856), reviewed by E. Littré in *Médecine et médecins* (Paris, 1872); G. Grote, *History of Greece*, ch. lxviii., and *Plato and the Other Companions*

of Sokrates (London, 1865); C. F. Hermann, *De Socratis accusatoribus* (Göttingen, 1854); W. H. Thompson, *The Phaedrus of Plato* (London, 1868), Appendix I.; Joel, *Der echte und der Xenophontische Sokrates* (1901). For the view taken in the present article with regard to the δαιμόνιον, see the writer's paper "On the δαιμόνιον of Socrates," in the *Journal of Philology*, v.; and cf. Chr. Meiners, *Vermischte philosophische Schriften* (Leipzig, 1776)—"in moments of 'Schwärmerei' Socrates took for the voice of an attendant genius what was in reality an instantaneous presentiment in regard to the issue of a contemplated act." For a fuller statement of the writer's view of Plato's relations to Socrates, see a paper on Plato's *Republic*, vi. 509 D seq., in the *Journal of Philology*, vol. x., and a series of papers on "Plato's Later Theory of Ideas," in vols. x., xi., xiii., xiv., xv., xxv. of the same periodical.

See also SOPHISTS and ETHICS. (H. JA.)

SOCRATES, the name of a famous 5th-century church historian. In the course of the last twenty-five years (425–450) of the reign of Theodosius II. (the first thoroughly Byzantine emperor) at least six church histories were written in Greek within the limits of the Eastern Empire—those, namely, of Philostorgius the Arian, of Philip of Side, of Socrates, of Sozomen, of Theodoret and of Hesychius. Of these the first, no longer extant except in fragments, seems to have been the most important. Those of Philip and of Hesychius (the former an untrustworthy and dreary performance mentioned by Socrates [vii. 26, 27]) have also perished. The remaining three are now our main sources for church history from Constantine to Theodosius II. None of them has ventured upon a fresh treatment of the period dealt with by Eusebius; all three begin their narratives about the point where his closes. In the West the *Church History* of that author had already been continued by Rufinus and his *Chronicle* by Jerome, and the work of Rufinus was certainly known to the Byzantines. Nor did these write independently of each other, for Sozomen (*q.v.*) certainly had before him the work of Socrates, and Theodoret (*q.v.*) knew both of them. The three histories together became known in the West from the 6th century through the selection which Cassiodorus caused to be made from them, and it is to this selection (if we leave Rufinus and Jerome out of account) that the middle ages were mainly indebted for all they knew of the Arian controversies, and of the period generally between the Councils of Nice and Ephesus.

The Ἐκκλησιαστικὴ ἱστορία of Socrates, still extant in seven books, embracing the period from 306 to 439, was written in 439, or within a few years thereafter. He was born and brought up at Constantinople. The date of his birth is uncertain, but it cannot have been far from 380. Of the facts of his life we know practically nothing, except that he was not a cleric but a "scholasticus" or advocate. Of the occasion, plan and object of his work he has himself informed us in the prologues to his first, second, fifth and sixth books. It is dedicated to one Theodorus, who had urged him to write such a history. He had no thorough preparation for the task, and for the period down to the death of Constantius (361) was practically dependent on Rufinus. After his work was finished he became a student of Athanasius' writings and came to see how untrustworthy his guide had been. He accordingly rewrote his first two books (see *H. E.* ii. 1) certainly before 450 and probably before 444 (see Geppert p. 8), and it is only this revision that has reached us. The chief sources from which he drew were: (1) the *Church History*, the *Life of Constantine* and certain theological works of Eusebius; (2) the *Church History* of Rufinus; (3) certain works of Athanasius; (4) the no longer extant Συναγωγὴ τῶν συνοδικῶν of the Macedonian and semi-Arian Sabinus—a collection of acts of councils with commentaries, brought down to the reign of Theodosius I. (this was a main source); (5) the *Constantinopolitan Chronicle*; (6) possibly a collection of imperial biographies; (7) lists of bishops; (8) collections of letters by members of the Arian and orthodox parties. He also used writings of Gregory Thaumaturgus, Archelaus, Acacius, Didymus, George of Laodicea, Gregory Nazianzen, Timothy of Berytus (see Lietzmann, *Apollinaris von Laodicea*, p. 44), Nestorius, Eusebius Scholasticus, Philip of Side, Evagrius, Palladius, Eutropius, the emperor Julian and orations of Libanius and Themistius; and he was apparently acquainted with some of the works of Origen and with Pamphilus' *Apologia pro Origene*. (On his sources see Jeep, and especially Geppert.) Jeep alleges (pp. 149 sqq.), but without adequate proof, that he made use of Philostorgius. As regards profane history his materials were exceedingly defective. Thus, for example, he confesses that his reason for not giving an account of the wars of Constantine is his inability to ascertain anything certain about them (v. *praef.*). His reckonings by Olympiads are generally wrong, the error arising chiefly from carelessness. He is greatly indebted to oral tradition and to the testimony of eye-witnesses, especially of members of the Novatian community in Constantinople; some things also he has set down from personal knowledge. The contents of the closing books are for the most part derived from oral tradition, from the narratives of friends and countrymen, from what was still generally known and current in the capital about past events, and from the ephemeral literature of the day.

The theological position of Socrates, so far as he can be said to have had one, is at once disclosed in his unlimited admiration for Origen. All the enemies of the great Alexandrian he regards merely as empty and vain obscurantists; for the orthodoxy of his hero he appeals to Athanasius. Closely connected with his high regard for Origen are his appreciation of science generally and the moderation of his judgment on all dogmatic questions. According to him, Ἑλληνικὴ παιδεία is quite indispensable within the Church; many Greek philosophers were not far from the knowledge of God, as is proved by their triumphant arguments against atheists and gainsayers of divine providence. The apostles did not set themselves against the study of Greek literature and science; Paul had even made a thorough study of them himself. The Scriptures, it is true, contain all that appertains to faith and life, but give no clue to the art of confuting gainsayers. Greek science, therefore, must not be banished from the Church, and the tendency within the Church so to deal with it is wrong. This point of view was the common one of the majority of educated Christians at that period, and is not to be regarded as exceptionally liberal. The same holds true of the position of Socrates in regard to dogmatic questions. On the one hand, indeed, orthodoxy and heresy are symbolized to his mind by the wheat and the tares respectively; he clings to the naive opinion of Catholicism, that contemporary orthodoxy has prevailed within the Church from the first; he recognizes the true faith only in the mystery of the Trinity; he judges heretics who have been already condemned as interlopers, as impudent innovators, actuated by bad and self-seeking motives; he apologizes for having so much as treated of Arianism at all in his history of the Church; he believes in the inspiration of the ecclesiastical councils as much as in that of the Scriptures themselves. But, on the other hand, he takes absolutely no interest in dogmatic subtleties and clerical disputes; he regards them as the source of great evils, and expresses his craving for peace: "one ought to adore the ineffable mystery in silence." This attitude, which was that of most educated Byzantine laymen, has in particular cases made it possible for him to arrive at very free judgments. Even granting that some feeble remains of antique reserve may have contributed to this, and even although some of it is certainly to be set down to his disposition and temperament, still it was his religious passivity that here determined the character of Socrates and made him a typical example of the later Byzantine Christianity. If Socrates had lived about the year 325, he certainly would not have ranked himself on the side of Athanasius, but would have joined the party of mediation. But—the ὁμοούσιος has been laid down, and must be recognized as correctly expressing the mystery; only one ought to rest satisfied with that word and with the repudiation of Arianism. Anything more, every new distinction, is mischievous. The controversy in its details is a νυκτομαχία to him, full of misunderstandings. Sometimes he gives prominence, and correctly, to the fact that the disputants partially failed to understand one another, because they had separate interests at heart—those on the one side desiring above everything to guard against polytheism, those on the other being most afraid of Sabellianism. He did not fail, however, to recognize also that the controversies frequently had their root in mere emulation, slander and sophistry. Not unfrequently he passes very sharp judgments on whole groups of bishops. In the preface to his fifth book he excuses his trenching on the region of political history on the ground of his desire to spare his readers the disgust which perusal of the endless disputes of the bishops could not fail to excite, and in that to his sixth book he prides himself on never having flattered even the orthodox bishops. This attitude of his has given him a certain measure of impartiality. Constantius, and even Julian—not Valens, it is true—are estimated very fairly. The Arian Goths who died for their religion are recognized as genuine martyrs. His characterizations of Cyril and Nestorius, and his narrative and criticism of the beginnings of the Christological controversy, are models of candour and historical conscientiousness. In frequent instances, moreover, he acknowledges his own incompetency to give an opinion and hands the question over to the clergy. For the clergy as a whole, in spite of his criticism of individuals, he has the very highest respect, as also for the monks, without himself making any inordinate religious professions. In a special excursus of considerable length he has paid a tribute of the highest order to monachism, and in his characterization of Theodosius II. also (where he has made use of the brightest colours) he does not fail to point out that in piety the emperor could almost compete with the monks. But, apart from these two chapters (iv. 23, vii. 22), it is but seldom that one could learn from the pages of Socrates that there was such a thing as monasticism in those days. To his mind the convent is not far removed from the church, and as a layman he is not at all inclined to accept the principles of monachism as applying to himself or to square his views of history in accordance with them. He has even gone so far as formally to express his sympathy with Paphnutius, the champion of the right of bishops to marry.

As a source for the period within which he wrote, the work of Socrates is of the greatest value, but as "history" it disappoints even the most modest expectations. Eusebius, after all, had some conception of what is meant by "church history," but Socrates has none. "As long as there is peace there is no material for a history of the church"; but, on the other hand, neither do heresies by rights come into the story. What, then, is left for it? A collection of anecdotes and a series of episodes. In point of fact this is the view actually taken by Socrates. His utter want of care and consistency appears most clearly in his vacillation as to the relations between ecclesiastical and political history. At one time he brings in politics, at another he excuses himself from doing so. He has not failed to observe that Church and State act and react upon each other; but he has no notion how the relation ought to be conceived. Nevertheless, his whole narrative follows the thread of political—that is to say, of imperial—history. This indeed is characteristic of his Byzantine Christian point of view; church history becomes metamorphosed into a history of the emperors and of the state, because a special church history is at bottom impossible. But even so one hardly hears anything about state or court except great enterprises and anecdotes. Political insight is wholly wanting to Socrates; all the orthodox emperors blaze forth in a uniform light of dazzling splendour; even the miserable Arcadius is praised, and Theodosius II. figures as a saint whose exemplary piety turned the capital into a church. If in addition to all this we bear in mind that in his later books the historian's horizon is confined to the city and patriarchate of Constantinople, that he was exceedingly ill informed on all that related to Rome and the West, that in order to fill out his pages he has introduced narratives of the most unimportant description, that in not a few instances he has evinced his credulity (although when compared with the majority of his contemporaries he is still entitled to be called critical), it becomes sufficiently clear that his *History*, viewed as a whole and as a literary production, can at best take only a secondary place. One great excellence, however, cannot be denied him, his honest and sincere desire to be impartial. He tried also, as far as he could, to distinguish between the certain, the probable, the doubtful and the untrue. He made no pretence to be a searcher of hearts and frequently declines to analyse motives. He has made frank confession of his nescience, and in certain passages his critical judgment and sober sense and circumspection are quite striking. He writes a plain and unadorned style and shuns superfluous words. Occasionally even there are touches of humour and of trenchant satire—always the sign of an honest writer. In short, his learning and knowledge can be trusted little, but his goodwill and straightforwardness a great deal. Considering the circumstances under which he wrote, it can only be matter for congratulation that such a man should have become our informant and that his work has been preserved to us.

Finally, it looks as if Socrates was either himself originally a Novatianist who had afterwards joined the Catholic Church, or stood, through his ancestors or by education, in most intimate relations with the Novatianist Church. In his *History* he betrays great sympathy with that body, has gone with exactness into its history in Constantinople and Phrygia, and is indebted for much of the material of his work to Novatianist tradition and to his intercourse with prominent members of the sect. Both directly and indirectly he has declared that Novatianists and Catholics are brothers, that as such they ought to seek the closest relations with one another, and that the former ought to enjoy all the privileges of the latter. His efforts, however, had only this result, that he himself afterwards fell under suspicion of Novatianism.

Editions and Literature.—Socrates' *History* has been edited by Stephanus (Paris, 1544; Geneva, 1612), Valesius (Paris, 1659 sqq.), Reading (Cambridge, 1720), Hussey (Oxford, 1853, reissued by Bright, 1878). It is also to be found in volume lxvii. of Migne's *Patrologia*, and there is an Oxford school edition (1844) after Reading. The latest English translation, revised by Zenos, is published in the Nicene and post Nicene Fathers, 2nd series, vol. ii. There are *Testimonia veterum* in Valesius and more fully in Hussey; and Nolte's paper in *Tübing. Quartalschr.* (1859, p. 518 seq.), contains emendations in Hussey's text, and notes towards the history of the text and editions; see also Overbeck, in *Theol. lit. Ztung.* (1879), no. 20.

Special studies have been made by Baronius, Miraeus, Labbé, Valesius, Halloix, Scaliger, Ceillier, Cave, Dupin, Pagi, Ittig, Tillemont, Walch, Gibbon, Schroeckh, Lardner. See also Voss, *De histor. graecis*; Fabricius-Harless, *Biblioth. gr.*, vol. vii.; Rössler, *Bibliothek d. Kirchenväter*; Holzhausen, *De fontibus quibus Socr., Soz., ac Theod. in scribenda historia sacra usi sunt* (Göttingen, 1825); Stäudlin, *Gesch. u. Lit. d. K.-G.* (Hanover, 1827); Baur, *Epochen* (1852); Harnack, "*Socrates u. Sozomen*" in Herzog-Hauck's *Realencykl.*, 2nd ed.; Loeschke, "Sokrates," ibid., 3rd. ed. Detached details are given also in works upon Constantine (Manso), Julian (Mücke, Rode, Neumann, Rendall), Damasus (Rade), Arianism (Gwatkin's *Studies of Arianism*, which gives a severe but trustworthy criticism of Rufinus and discusses the manner in which Socrates was related to him), the emperors after Julian (De Broglie, Richter, Clinton, the *Weltgeschichte* of Ranke, the *Gesch. d. oströmischen Reiches unter den Kaisern Arcadius u. Theod. II.* (1885) of Güldenpenning, and the *Kaiser Theodosius d. Gr.*, Halle (1878) of Güldenpenning and Iffland, the last-named work discussing the relation of Socrates to Sozomen), the barbarian migrations (Wietersheim, Dahn), the Goths (Waitz, Bessel, Kauffmann and Scott's *Ulfilas*, 1885). Lastly, reference may be made to Sarrazin, *De Theodoro Lectore, Theophanis fonte praecipuo* (1881, treats of the relation between Socrates and Sozomen, and of the completeness of the former's work); Jeep, *Quellenuntersuch. z. d. griech. Kirchenhistorikern* (1884); Geppert, *Die Quellen des Kirchenhistorikers Socrates Scholasticus* (1898). (A. Ha.; A. C. McG.)

SODALITE, a group of rock-forming minerals comprising the following isomorphous species:—

Sodalite	. .	$Na_4(AlCl)Al_2(SiO_4)_3$
Haüynite	. .	$(Na_2, Ca)_2(NaSO_4{\cdot}Al)Al_2(SiO_4)_3$
Noselite	. .	$Na_4(NaSO_4{\cdot}Al)Al_2(SiO_4)_3$
Lazurite	. .	$Na_4(NaS_3{\cdot}Al)Al_2(SiO_4)_3$

They are thus sodium (or calcium) aluminium silicates, with chloride, sulphate or sulphide. In their orthosilicate formulae, as above written, and in their cubic crystalline form they present a certain resemblance to the members of the garnet group. Crystals usually have the form of the rhombic dodecahedron, and are often twinned with interpenetration on an octahedral plane. They are white, or often blue in colour, and have a vitreous lustre. The hardness is $5\frac{1}{2}$, and the specific gravity 2·2-2·4. These minerals are characteristic constituents of igneous rocks rich in soda, and they also occur in metamorphic limestones.

The species sodalite (so named because it contains soda) occurs as well-formed, colourless crystals in the ejected limestone blocks of Monte Somma, Vesuvius, and in the sodalite-syenite of Julianehaab in south Greenland. Massive blue material is common in the elaeolite-syenites of southern Norway, Gyergyo-Ditró in Transylvania, Miyask in the Urals, Litchfield in Maine, Dungannon in Ontario, Ice river in Kootenay county, British Columbia, &c.; at the three last-named localities it is found as large masses of a bright sky-blue colour and suitable for cutting as an ornamental stone. Recently, large masses with a pink colour, which quickly fades on exposure to light, have been met with in elaeolite-pegmatite at Kishangarh in Rajputana. Haüynite, or haüyne (named after R. J. Haüy), occurs as bright blue crystals and grains in the lavas (phonolite, tephrite, &c.) of Vesuvius, Rome, the Eifel, &c. Noselite, or nosean, is found as greyish crystals in the sanidine bombs of the Eifel. Lazurite is an important constituent, together with some haüynite and sodalite, of lapis-lazuli (*q.v.*). (L. J. S.)

SODEN, a town and spa of Germany, in the Prussian province of Hesse-Nassau, pleasantly situated in the valley of the Sulzbach under the southern slope of the Taunus range, 10 m. from Frankfort-on-Main and 4 m. N. from Höchst by rail. Pop. (1905), 1917. The chief interest of the place centres in its brine springs which are largely impregnated with carbonic acid gas and oxide of iron, and are efficacious in chronic catarrh of the respiratory organs, in liver and stomach disorders and women's diseases. The waters are used both internally and externally, and are largely exported. Soden lozenges (*Sodener Pastillen*), condensed from the waters, are also in great repute. Soden has a large and well-appointed Kurhaus, an Evangelical and a Roman Catholic church, and a hospital for indigent patients.

See Haupt, *Soden am Taunus* (Würzburg, 1902); and Köhler, *Der Kurort Soden am Taunus und seine Umgebungen* (Frankfort, 1873).

SODEN, HERMANN, Freiherr von (1852–), German biblical scholar, was born in Cincinnati on the 16th of August 1852, and was educated at the university of Tübingen. He was minister of Dresden-Striesen in 1881 and in 1887 became minister of the Jerusalem Church in Berlin. In 1889 he became *privatdozent* in the university of Berlin, and four years later was appointed extraordinary professor of divinity. His earlier works include *Philipperbrief* (1890); "Untersuchungen über neutest. Schriften" in the *Protest. Jahrb. theolog. Studien und Schriftkommentar* (1895–1897); *Und was tut d. evangel. Kirche?* (3rd. ed. 1890); *Reisebriefe aus Palästina* (2nd ed. 1901); *Palästina und seine Gesch.* (2nd ed. 1904); *Die wichtigsten Fragen im Leben Jesu* (1904); *Urchristliche Literaturgesch.* (1904). His most important book is *Die Schriften des neuen Testaments, in ihrer ältesten erreichbaren Textgestalt hergestellt auf Grund ihrer Textgeschichte* (Berlin, Bd. I., 1902–1910); certainly the most important work on the text of the New Testament which had been published since Westcott and Hort's *New Testament in the Original Greek* (see BIBLE: *New Testament*).

Von Soden introduces, besides a new notation of MSS. (see Bible, N.T. MSS. and versions), a new theory of textual history. He thinks that in the 4th century there were in existence three recensions of the text, which he distinguishes as *K*, *H* and *I*, with the following characteristics and attestations.

K corresponds roughly to Westcott and Hort's Syrian Antiochian text; it was probably made by Lucian in the 4th century. This was in the end the most popular form of text, and is found in a more or less degenerate state in all late MSS. The purest representatives are 61(Ω), ϵ 75 (V), 92, (461), 94, 1027 (S), 1126 (476 = scrivener's k) ϵ179 (661). Later recensions of *K* are called K^x and K^r, and there are also others of less importance which represent the combination of *K* with other texts.

H represents Westcott and Hort's Neutral and Alexandrian texts between which von Soden does not distinguish.

It is found in eleven MSS. in varying degrees of purity: δ1(B), δ 2 (א), δ 3 (C), δ 6 (Ψ), δ 48 (33), ϵ26 (Z), ϵ56 (L), ϵ76 (Δ) ϵ 1026 (892), δ 371 (1241) and ϵ 376 (579). Between these MSS. there is no very intimate connexion except between δ 1 and δ 2 (B and א) which represent a common original (δ^{1-2}). δ^{1-2} is the best representative of *H*, but it has been contaminated by the Egyptian versions, and sometimes by the *K* and *I* texts and by Origen, though not to any great extent.

The other *H* MSS. are none of them equal in value to the two great uncials. They have all been influenced by *K*, *I*, and by the text of parallel passages, to a greater extent than δ^{1-2}, or than either of the two witnesses to δ^{1-2}, but some of them have less Egyptian corruption.

The origin of the *H* text must be regarded as unquestionably Egyptian, in view of the fact that it was used by all the Egyptian Church writers after the end of the 3rd century, and von Soden adopts the well-known hypothesis, first made popular by Bousset, that it represents the recension of Hesychius.

I does not quite correspond to anything in Westcott and Hort's system, but has points of contact with their "Western" text. It is found in a series of subgroups of MSS. known as H^r, *J*, I^a, and others of less importance (about eleven subgroups are suggested). Of these H^r is a family containing Cod. *I* and its allies (δ254, ϵ346, δ457, δ467, &c.), ϵ288 (22) and some allied MSS. ϵ203 (872), ϵ183 and ϵ 1131; *J* is the well-known Ferrar group; and I^a contains δ 5 (D), ϵ93 (565), ϵ133 (700), ϵ168 (28), ϵ050 and some others. It is necessary to note that von Soden is able to place D in this group because he regards it as owing many of its most remarkable readings to contamination with the Latin version. *I* is, according to von Soden, a Palestinian recension connected with Eusebius, Pamphilus and Origen.

After establishing the text of *I*, *H* and *K*, von Soden reconstructs an hypothetical text, *I-H-K*, which he believes to have been their ancestor. He then tries to show that this text was known to all the writers of the 3rd and 2nd centuries, but has naturally to account for the fact that the quotations of these writers and the text of the early versions often diverge from it. The explanation that he offers is that the Diatessaron of Tatian was widely used and corrupted all extant texts, so that the Old Syriac, the Old Latin, the quotations of Irenaeus, Clement, Tertullian and others may be regarded as various combinations of the Tatianic text and *I-H-K*. Finally, he tries to show that the Tatianic text is itself in the main merely a corrupt form of *I-H-K* altered in order to suit the necessities of Tatian's plan.

For criticism of this important theory up to 1909 see Nestle's *Einführung in das griechische neue Testament*, pp. 274–278 (3rd ed., Göttingen, 1909), and K. Lake's *Professor H. von Soden's Treatment of the Text of the Gospels*, Edinburgh, 1908). (K. L.)

SÖDERHAMN, a seaport of Sweden, in the district (*län*) of Gefleborg, on an inlet of the Gulf of Bothnia, near the mouth of the Ljasne River, 183 m. N. by W. of Stockholm by rail. Pop. (1900), 11,258. This is one of the principal centres of the timber export trade, having saw-mills, planing-mills and wood-pulp works. There are also ironworks and breweries. Vessels drawing 15 ft. have access to Branthäll, where they generally load. The harbour is at the suburb of Stugsund. It is usually ice-bound for some four months in winter. The town was given municipal privileges by Gustavus Adolphus in 1620, but is modern in appearance, having been rebuilt after fires in 1860 and 1865.

SODERINI, PIERO (1450–1513), Florentine statesman, was elected gonfalonier for life in 1502 by the Florentines, who wished to give greater stability to their republican institutions, which had been restored after the expulsion of Piero de' Medici and the martyrdom of Savonarola. His rule proved moderate and wise, although he had not the qualities of a great statesman. He introduced a system of national militia in the place of foreign mercenaries, and during his government the long war with Pisa was brought to a close with the capture of that city by the Florentines in 1509. Grateful to France, who had assisted him, he always took the French side in Italian politics. But in 1512 the Medici with the help of a Spanish army returned to Florence, deposed Soderini and drove him into exile. He took refuge at Ragusa in Dalmatia, where he remained until the election of Pope Leo X., who summoned him to Rome and conferred many favours on him. Soderini lived in Rome, working for the good of Florence, to which he was never allowed to return, until his death.

See Razzi, *Vita di Pier Soderini* (Padua, 1737), also the articles FLORENCE and MEDICI.

SÖDERTELGE, a town of Sweden, in the district (*län*) of Stockholm, 23 m. W.S.W. of Stockholm by rail. Pop. (1900), 8,207. It is beautifully situated on a bay of Lake Mälar, which is here connected with the Baltic by the Södertelge canal, 1¼ m. in length, with a minimum depth of 10 ft. This is on the route followed by the Göta Canal steamers between Stockholm and Gothenburg: it was opened in 1819, though a canal was begun here in the first half of the 15th century at the instigation of the patriot Engelbrecht. The town contains an ancient church, believed to date from *c.*1100. Here and in the neighbourhood are the residences of many of the business class of Stockholm; and the town is in favour as a summer resort, having mineral springs and baths. There are engineering shops producing railway stock and motors, jute spinning and weaving mills, and match and joinery works.

SODIUM [symbol Na, from Lat. *natrium*; atomic weight 23·00 (O = 16)], a chemical element belonging to the group of alkali metals. It is abundantly and widely diffused in nature, but always in combination. Sodium chloride, or common salt (*q.v.*), is exceedingly common, being the chief salt present in sea-water, besides occurring in extensive stratified deposits. Sodium carbonates are also widely dispersed in nature, forming constituents of many mineral waters, and occurring as principal saline components in natron or trona lakes, as efflorescences in Lower Egypt, Persia and China, and as urao in Mexico, Colombia and Venezuela. The solid crusts found at the bottom of the salt lakes of the Araxes plain in Armenia contain about 16% of carbonate and 80 of sulphate. In Colombia there occurs a double salt, $Na_2CO_3 \cdot CaCO_3 \cdot 5H_2O$, known as gay-lussite. In Wyoming, California and Nevada enormous deposits of carbonates, mixed in some cases with sulphate and with chloride, occur. About Szegedin in Hungary and all over the vast pusztas (steppes) between the Theiss and the Danube, and from the Theiss up to and beyond Debreczin, the soil contains sodium carbonate, which frequently assumes the form of crude alkaline crusts, called "szekso," and of small saline ponds. A purified specimen of such Debreczin soda was found to contain as much as 90 % of real carbonate, $NaCO_3$, and 4 of common salt Natural sulphate occurs in an anhydrous condition as thenardite, Na_2SO_4, at Tarapaca, Chile, and in the rock-salt deposits at Espartinas near Aranjuez, Spain. Hydrated sulphates occur at several localities in the province of Madrid and in other provinces of Spain, and at Mühlingen in Aargau, and copious deposits of glauberite, the double sulphate of sodium and calcium, are met with in the salt-mines of Villarrubia in Spain, at Stassfurt, and in the province of Tarapaca, Chile, &c. A native nitrate of soda is obtained in great abundance in the district of Atacama and the province of Tarapaca, and is imported into Europe in enormous quantities as cubic nitre for the preparation of saltpetre. Cryolite, a fluoride of aluminium and sodium, is extensively mined in Greenland and elsewhere for industrial purposes. These form the principal natural sources of sodium compounds—the chloride as rock salt and in sea-water being of such predominating importance as quite to outweigh all the others. But it is questionable whether, taken altogether, the mass of sodium they represent is as much as that disseminated throughout the rocky crust in the form of soda felspar (*i.e.* as silicate of soda) and in other soda-containing rocks. From this source all soils contain small proportions of sodium in soluble forms, hence the ashes of plants, although they preferably imbibe potassium salts, contain traces and sometimes notable quantities of sodium salts. Sodium salts also form essential ingredients in all animal juices.

Although many sodium compounds have been known from very remote times, the element was not isolated until 1807, when Sir H. Davy obtained it by electrolysing caustic soda. This method was followed by that proposed by Gay-Lussac and Thénard, who decomposed molten caustic soda with red-hot iron; and this in turn was succeeded by Brunner's process of igniting sodium carbonate with charcoal. Deville made many improvements, but the method remained wasteful and uneconomical, and in 1872 the metal cost 4s. a pound. In 1886, however, Castner replaced the carbonate by caustic soda, and materially cheapened the cost of production; but this method was discarded for an electrolytic one, patented by Castner in 1890. Electrolytic processes had, in fact, been considered since 1851, when Charles Watt patented his method for the production of sodium and potassium from fused chlorides. Among the difficulties here to be contended with are the destructive action of fused chlorides and of the reduced alkali metals upon most non-metallic substances available for the containing vessel and its partition, and also of the anode chlorine upon metals; also the low fusing-point (95° C. for sodium, and 62° C. for potassium) and the low specific gravity of the metals, so that the separated metal floats as a fused layer upon the top of the melted salt. Again, pure sodium chloride melts at about 775° C., while sodium boils at 877° C., so that the margin of safety is but small if loss by vaporization is to be prevented. Borchers endeavoured to contend against the first difficulty by employing an iron cathode vessel and a chamotte (fire-clay) anode chamber united by a specially constructed water-cooled joint. The other difficulty is to some extent met by using mixed chlorides (*e.g.* sodium, potassium and strontium chlorides for sodium extraction), as these melt at a lower temperature than the pure chloride. In Castner's process (as employed at Oldbury and Niagara Falls and in Germany) fused caustic soda is electrolysed. The apparatus described in the patent specification is an iron cylinder heated by gas rings below, with a narrower cylinder beneath, through which passes upwards a stout iron cathode rod cemented in place by caustic soda solidified in the narrower vessel. Iron anodes are suspended around the cathode, and between the two is a cylinder of iron gauze at the bottom with a sheet-iron continuation above, the latter being provided with a movable cover. During electrolysis, oxygen is evolved at the anode and escapes from the outer vessel, while the sodium deposited in globules on the cathode floats upwards into the iron cylinder, within which it accumulates, and from which it may be removed at intervals by means of a perforated iron ladle, the fused salt, but not the metal, being able to pass freely through the perforations. The sodium is then cast into moulds. Sodium hydroxide has certain advantages compared with chloride, although it is more costly; its fusing-point is only 320° C., and no anode chlorine is produced, so that both containing vessel and anode may be of iron, and no porous partition is necessary.

Metallic sodium possesses a silvery lustre, but on exposure to moist air the surface is rapidly dulled by a layer of the hydroxide. It may be obtained crystallized in the quadratic system by melting in a sealed tube containing hydrogen, allowed to cool partially, and then pouring off the still liquid portion by inverting the tube. The specific gravity is 0·9735 at 13·5° (Baumhauer). At ordinary temperatures the metal has the consistency of wax and can be readily cut; on cooling it hardens. On heating it melts at 95·6° (Bunsen) to a liquid resembling mercury, and boils at 877·5° (Ruff and Johannsen, *Ber.*, 1905, 38, p. 3601), yielding a vapour, colourless in thin layers but a peculiar purple, with a greenish fluorescence, when viewed through thick layers. (For the optics of sodium vapour see R. W. Wood, *Physical Optics*.) According to A. Matthiessen, sodium ranks fourth to silver, copper and gold as a conductor of electricity and heat, and according to Bunsen it is the most electropositive metal with the exception of caesium, rubidium and potassium.

The metal is very reactive chemically. Exposed to moist air it rapidly oxidizes to the hydroxide; and it burns on heating in air with a yellow flame, yielding the monoxide and dioxide. A fragment thrown on the surface of water rapidly disengages hydrogen, which gas, however, does not inflame, as happens with potassium; but inflammation occurs if hot water be used, or if the metal be dropped on moist filter paper. Sodium also combines directly, sometimes very energetically, with most non-metallic elements. It also combines with dry ammonia at 300–400° to form sodamide, $NaNH_2$, a white waxy mass when pure, which melts at 155°. Heated in a current of carbon dioxide sodamide yields caustic soda and cyanamide, and with nitrous oxide it gives sodium azoimide; it deflagrates with lead or silver nitrate and explodes with potassium chlorate. Sodamide was introduced by Claisen (*Ber.*, 1905, 38, p. 693) as a condensing agent in organic chemistry, and has since been applied in many directions. Sodium is largely employed in the manufacture of cyanides and in reduction processes leading to the isolation of such elements as magnesium, silicon, boron, aluminium (formerly), &c.; it also finds application in organic chemistry. With potassium it forms a liquid alloy resembling mercury, which has been employed in high temperature thermometers (see THERMOMETRY).

Compounds.

In its chemical combinations sodium is usually monovalent; its salts are generally soluble in water, the least soluble being the metantimonate.

Sodium hydride, NaH, is a crystalline substance obtained directly from sodium and hydrogen at about 400°. It burns when heated in dry air, and ignites in moist air; it is decomposed by water, giving caustic soda and hydrogen. Dry carbon dioxide is decomposed by it, free carbon being produced; moist carbon dioxide, on the other hand, gives sodium formate.

Several oxides are known. A suboxide, Na_4O, appears to be formed as a grey mass when a clean surface of the metal is exposed to air, or when pure air is passed through the metal just above its melting point (De Forcrand, *Compt. rend.*, 1898, 127, pp. 364, 514). The monoxide, Na_2O, is obtained by heating the metal above 180° in a limited amount of slightly moist oxygen (Holt and Sims, *Journ. Chem. Soc.*, 1894, i. 442); it may also be prepared by heating the nitrate or nitrite with metallic sodium, free nitrogen being eliminated (German patent, 142467, 1902). It forms a grey mass, which melts at a red heat and violently combines with water to give the hydroxide. The hydroxide or caustic soda, NaOH, is usually manufactured from the carbonate or by electrolysis of salt solution (see ALKALI MANUFACTURE). When anhydrous it is a colourless opaque solid which melts at 310°, and decomposes at about 1100°. It is very soluble in water, yielding a strongly alkaline solution; it also dissolves in alcohol. It absorbs moisture and carbon dioxide from the atmosphere. Several hydrates are known: $2NaOH{\cdot}7H_2O$ is obtained as large monoclinic crystals by cooling a solution of specific gravity 1·365 to −8°; Pickering (*Journ. Chem. Soc.*, 1893, 65, p. 890) obtained $NaOH{\cdot}H_2O$ from hot concentrated solutions and $NaOH{\cdot}2H_2O$ from a solution of the hydroxide in 96·8% alcohol. (See also De Forcrand, *Compt. rend.*, 1901, 133, p. 223.)

Sodium dioxide, Na_2O_2, is formed when the metal is heated in an excess of air or oxygen. In practice the metal is placed on aluminium trays traversing an iron tube heated to 300°, through which a current of air, freed from moisture and carbon dioxide, is passed; the process is made continuous, and the product contains about 93% Na_2O_2. When pure, sodium dioxide has a faint yellowish tinge, but on exposure it whitens (W. R. Bousfield and T. M. Lowry, *Phil. Trans.*, 1905, A. 204, p. 253). When dissolved in water it yields some NaOH and H_2O_2; on crystallizing a cold solution $Na_2O_2{\cdot}8H_2O$ separates as large tabular hexagonal crystals, which on drying over sulphuric acid give $Na_2O_2{\cdot}2H_2O$, the former is also obtained by precipitating a mixture of caustic soda and hydrogen peroxide solutions with alcohol. Acids yield a sodium salt and free oxygen or hydrogen peroxide; with carbon dioxide it gives sodium carbonate and free oxygen; carbon monoxide gives the carbonate; whilst nitrous and nitric oxides give the nitrate. A solution in hydrochloric acid, consisting of the chloride and hydrogen peroxide, is used for bleaching straw under the name of soda-bleach; with calcium or magnesium chlorides this solution gives a solid product which, when dissolved in water, is used for the same purpose (Castner, *Journ. Soc. Chem. Ind.*, 1893, p. 603). Sodium dioxide is chiefly employed as an oxidizing agent, being used in mineral analysis and in various organic preparations; it readily burns paper, wood, &c., but does not evolve oxygen unless heated to a high temperature. Sodyl hydroxide, $NaHO_2$, exists in two forms: one, Na·O·OH, obtained from hydrogen peroxide and sodium ethylate; the other, O:Na·OH, from absolute alcohol and sodium peroxide at 0°. They are strong oxidizing agents and yield alkaline solutions which readily evolve oxygen on heating. Sodium trioxide, Na_2O_3, is said to be formed from an excess of oxygen and a solution of sodammonium in liquid ammonia. Water decomposes it, giving oxygen and the dioxide.

Generally speaking, sodium salts closely resemble the corresponding potassium salts, and their methods of preparation are usually the same. For sodium salts not mentioned below reference should be made to articles wherein the *acid* is treated, unless otherwise indicated.

Sodium combines directly with the halogens to form salts which are soluble in water and crystallize in the cubic system. The fluoride, NaF, is sparingly soluble in water (1 part in 25). For the chloride see SALT. The bromide and iodide crystallize from hot solutions in anhydrous cubes; from solutions at ordinary temperatures in monoclinic prisms with $2H_2O$; and at low temperatures with $5H_2O$. According to M. Loeb (*Journ. Amer. Chem. Soc.*, 1905, 27, p. 1019) the iodide differs from the other haloid salts in separating from solution in alcohols with "alcohol of crystallization." Sodium sulphide, Na_2S, obtained by saturating a caustic soda solution with sulphuretted hydrogen and adding an equivalent of alkali, is employed in the manufacture of soluble soda glass. Sodium sulphite, Na_2SO_3, which is employed as an antichlor, is prepared (with $7H_2O$) by saturating a solution of sodium carbonate with sulphur dioxide, adding another equivalent of carbonate and crystallizing. The anhydrous salt may be prepared by heating a saturated solution of the hydrated salt. H. Hartley and W. H. Barrett (*Journ. Chem. Soc.*, 1909, 95, p. 1184) failed to obtain a decahydrate which had been previously described. The acid sulphite, $NaHSO_3$, obtained by saturating a cold solution of the carbonate with sulphur dioxide and precipitating by alcohol, is employed for sterilizing beer casks. Sodium sulphate, Na_2SO_4, known in the hydrated condition (with $10H_2O$) as Glauber's salt, is manufactured in large quantities for conversion into the carbonate or soda (see ALKALI MANUFACTURE). It has long been doubted whether sodium yielded an alum; this was settled by N. I. Surgunoff in 1909 (*Abst. Journ. Chem. Soc.* ii. 1001), who obtained cubic crystals from a supersaturated solution of sodium and aluminium sulphates below 20°, higher temperatures giving monoclinic crystals. The acid sulphate, $NaHSO_4$, also known as bisulphate of soda, is obtained as large asymmetric prisms by crystallizing a solution of equivalent quantities of the normal sulphate and sulphuric acid above 50°. The acid salts $Na_3H(SO_4)_2$ and $Na_3H(SO_4)_2 \cdot H_2O$ are obtained from the normal sulphate and sulphuric acid (J. D'Ans, *Ber.*, 1906, 39, p. 1534).

The manufacture of sodium carbonate, commonly called soda, is treated under ALKALI MANUFACTURE. The anhydrous salt is a colourless powder or porous mass, having an alkaline taste and reaction. It melts at 1008°. On solution in water, heat is evolved and hydrates formed. Common washing soda or soda-crystals is the decahydrate, $Na_2CO_3 \cdot 10H_2O$, which appears as large clear monoclinic crystals. On exposure, it loses water and gives the monohydrate, $Na_2CO_3 \cdot H_2O$, a white powder sold as "crystal carbonate"; this substance, which is also formed on heating the decahydrate to 34°, crystallizes in the rhombic system. Both these hydrates occur in the mineral kingdom, the former as natron and the latter as thermonatrite. The heptahydrate, $Na_2CO_3 \cdot 7H_2O$, is obtained by crystallizing a warm saturated solution in a vacuum; it appears to be dimorphous. The acid carbonate or bicarbonate of soda, $NaHCO_3$, is produced in the ammonia-soda process for alkali manufacture. Another acid carbonate, $Na_2CO_3 \cdot 2NaHCO_3 \cdot 3H_2O$, is the mineral trona or urao. We may here notice the "percarbonates" obtained by Wolffenstein and Peltner (*Ber.*, 1908, 41, pp. 275, 280) on acting with gaseous or solid carbon dioxide on Na_2O_2, Na_2O_3 and $NaHO_2$ at low temperatures; the same authors obtained a perborate by adding sodium metaborate solution to a 50% solution of sodium peroxide previously saturated with carbon dioxide. For sodium nitrite see NITROGEN; for sodium nitrate see SALTPETRE; for the cyanide see PRUSSIC ACID; and for the borate see BORAX.

Of the sodium silicates the most important is the mixture known as soluble soda glass formed by calcining a mixture of white sand, soda-ash and charcoal, or by dissolving silica in hot caustic soda under pressure. It is a colourless transparent glass mass, which dissolves in boiling water to form a thick liquid. It is employed in certain printing processes, as a cement for artificial stone and for mending glass, porcelain, &c., and also for making the so-called silicated soaps (see SOAP).

Sodium is most distinctly recognized by the yellow coloration which volatile salts impart to a Bunsen flame, or, better, by its emission spectrum which has a line (double), the Fraunhofer D, line, in the yellow (the wave-lengths are 5896 and 5890). The atomic weight was determined by Stas to be 22·87 (H = 1); T. W. Richards and R. C. Wells (*Journ. Amer. Chem. Soc.*, 1905, 27, p. 459) obtained the value 23·006 (O = 16).

Medicine.

Pharmacology.—The metal sodium is not used in medicine, but many of its salts are employed. Besides *liquor sodii ethylatis* the following salts and preparations are used in the British Pharmacopoeia. (1) *Sodii carbonis*, known as washing soda; this carbonate on heating yields *sodii carbonis exsiccatus* and *sodii bicarbonas*; from the latter is made *trochiscus sodii bicarbonatis*. (2) *Sodii phosphas*. From sodium phosphate are made *sodii phosphas effervescens* and *sodii hypophosphis* (see PHOSPHORUS). (3) *Sodii sulphas* (Glauber's salt), with its sub-preparation *sodii sulphas effervescens*. (4) *Soda tartarata* (Rochelle salt), a tartrate of sodium and potassium, from which is made *pulvis sodae tartaratae effervescens*, known as Seidlitz powder. (5) *Sodii citro-tartras effervescens*, a mixture of sugar, sodium bicarbonate, citric and tartaric acids. (6) *Sodii chloridum*, common salt. (7) *Sodii sulphis*.

For *sodii bromidum*, *iodidum* and *salicylatum* see BROMINE, IODINE and SALICYLIC ACID respectively. For *sodii arsenas* and *cacodylate* see ARSENIC. *Sapo durus* (hard soap) is a compound of sodium with olive oil, and *sapo animalis* (curd soap) is chiefly sodium stearate.

Toxicology.—Poisoning by caustic soda is rare, but occasionally it takes place by swallowing soap lees (sodium carbonate), which may contain some impurities of caustic soda. The symptoms and treatment are the same as described under POTASSIUM. The salts of sodium resemble potassium in their action on the alimentary tract, but they are much more slowly absorbed, and much less diffusible; therefore considerable amounts may reach the small intestine and there act as saline purgatives. They are slowly absorbed into the blood, and are a natural constituent of the blood plasma, which derives them from the food. Sodium is excreted by all the mucous surfaces and by the liver and kidneys. On the latter they act as diuretics, but less powerfully than potassium, increasing the flow of water and the output of urea and rendering the urine less acid. They are said to diminish the secretion of the bronchial mucous membrane.

Therapeutics: *External Use.*—The liquor sodii ethylatis is a powerful caustic and is used to destroy small naevi and warts. A lotion of sodium bicarbonate is useful to allay itching. Solutions of sodium sulphite are used as mild antiparasitics. *Internal use.*—Sodium chloride is occasionally used in warm water as an emetic, and injections of it into the rectum as a treatment for thread worms. A 0·9% solution forms what is termed normal saline solution, which is frequently injected into the tissues in cases of collapse, haemorrhage and diarrhoea. It forms a valuable treatment in diabetic coma and eclampsia, acting by diluting the toxins in the blood. From this has developed the intramuscular injection of diluted sea-water in the treatment of gastro-enteritis, anaemia and various skin affections. Sodium chloride is an important constituent of the waters of Homburg, Wiesbaden, Nauheim and Kissingen. Sodium bicarbonate is one of our most useful gastric sedatives and antacids, relieving pain in hyperchloridia. It is the constituent of most stomachic mixtures. Effervescent soda water is a mild gastric sedative. Sodium phosphate and sulphate are cholagogue purgatives and are used in the treatment of gallstones. The sulphate is the chief constituent of Marienbad and Carlsbad waters. Large doses of these salts are used to remove fluid in dropsy. Soda tartarate is purgative and diuretic, as is the citro-tartarate. These purgative sodium salts are most useful in the treatment of chronic constipation, and of the constipation associated with gout and hepatic dyspepsia. They should be dissolved in warm water and taken in the morning, fasting. In visceral gout and chronic catarrhal conditions of the stomach a course of alkaline waters is distinctly beneficial. Sodium salts have not the depressant effect so marked in those of potassium.

SODOM AND GOMORRAH, in biblical geography, two of five cities (the others named Admah, Zeboiim and Bela or Zoar) which were together known as the "cities of the *Kikkar*" (circle), somewhere in the neighbourhood of the Dead Sea. They occupied a fertile region, chosen by Lot for his dwelling (Gen. xiii. 10–12). They were attacked by the four great Eastern kings and spoiled, but restored by the intervention of Abram and his men coming to the aid of Lot (Gen. xiv.). They were proverbial for wickedness, for which they were destroyed by a rain of "fire and brimstone" (Gen. xix.). The site of the cities, the historicity of the events narrated of them and the nature of the catastrophe that destroyed them, are matters of hot dispute. Modern names, more or less similar to the ancient appellations, have been noted in different parts of the Dead

Sea area; but no certain identification can be based on these similarities. The most striking coincidence is Jebel *Usdum*, by some equated with confidence to *Sodom*. The names are radically identical; but the hill is merely a salt-ridge 600 ft. high and 7 m. long, and cannot possibly represent an ancient city. The most that can be said is that the names have lingered in the Jordan valley in a vague tradition—very likely helped by, if not entirely due to, literary accounts of the catastrophe—just as has the name of Lot himself in the Arab name of the Dead Sea. The catastrophe has been explained as a volcanic eruption, or an explosive outburst of gas and oil stored and accumulating at high pressure. The latter, to which parallels in geologically similar regions in America are not unknown, is the most probable natural explanation that can be offered. (R. A. S. M.)

SODOMA, IL (1477–1549), the name given to the Italian painter Giovanni Antonio Bazzi (who until recent years was erroneously named Razzi). He is said to have borne also the name of "Sodona" as a family name, and likewise the name Tizzioni; Sodona is signed upon some of his pictures. While "Bazzi" was corrupted into "Razzi," "Sodona" may have been corrupted into "Sodoma"; Vasari, however, accounted for the name differently, as a nickname from his personal character. This version appears to have been inspired by Bazzi's pupil and subsequent rival Beccafumi. In R. H. Cust's recent work on the painter another suggestion is made. Vasari tells a story that, Bazzi's horse having won a race at Florence, a cry of "Who is the owner?" went up, and Bazzi contemptuously answered "Sodoma," in order to insult the Florentines (according to Milanesi); and Mr Cust offers the suggestion of the Italian friend, that the racing name was really a clipped form of *So doma*, "I am the trainer." Whatever the real origin, the name was long supposed to indicate an immoral character.

Bazzi was of the family de Bazis, and was born at Vercelli in Lombardy in 1477. His first master was Martino Spanzotto, by whom one signed picture is known; and he appears to have been in his native place a scholar of the painter Giovenone. Acquiring thus the strong colouring and other distinctive marks of the Lombard school, he was brought to Siena towards the close of the 15th century by some agents of the Spannocchi family; and, as the bulk of his professional life was passed in this Tuscan city, he counts as a member of the Sienese school, although not strictly affined to it in point of style. He does not seem to have been a steady or laborious student in Siena, apart from some attention which he bestowed upon the sculptures of Jacopo della Quercia. Along with Pinturicchio, he was one of the first to establish there the matured style of the *Cinquecento*. His earliest works of repute are seventeen frescoes in the Benedictine monastery of Monte Oliveto, on the road from Siena to Rome, illustrating the life of St Benedict, in continuation of the series which Luca Signorelli had begun in 1498; Bazzi completed the set in 1502. Hence he was invited to Rome by the celebrated Sienese merchant Agostino Chigi, and was employed by Pope Julius II. in the Camera della Segnatura in the Vatican. He executed two great compositions and various ornaments and grotesques. The latter are still extant; but the larger works did not satisfy the pope, who engaged Raphael to substitute his "Justice," "Poetry," and "Theology." In the Chigi Palace (now Farnesina) Bazzi painted some subjects from the life of Alexander the Great; "Alexander in the Tent of Darius" and the "Nuptials of the Conqueror with Roxana" (by some considered his masterpiece) are more particularly noticed. When Leo X. was made pope (1513) Bazzi presented him with a picture of the "Death of Lucretia" (or of Cleopatra, according to some accounts); Leo gave him a large sum of money in recompense and created him a cavaliere. Bazzi afterwards returned to Siena and at a later date went in quest of work to Pisa, Volterra, and Lucca. From Lucca he returned to Siena, not long before his death, which took place on the 14th of February 1549 (the older narratives say 1554). He had squandered his property and is said (rather dubiously) to have died in penury in the great hospital of Siena. Bazzi had married in youth a lady of good position, but the spouses disagreed and separated pretty soon afterwards. A daughter of theirs married Bartolommeo Neroni, named also Riccio Sanese or Maestro Riccio, one of Bazzi's principal pupils.

It is said that Bazzi jeered at the *History of the Painters* written by Vasari, and that Vasari consequently traduced him; certainly he gives a bad account of Bazzi's morals and demeanour, and is niggardly towards the merits of his art. According to Vasari, the ordinary name by which Bazzi was known was "Il Mattaccio" (the Madcap, the Maniac)—this epithet being first bestowed upon him by the monks of Monte Oliveto. He dressed gaudily, like a mountebank; his house was a perfect Noah's ark, owing to the strange miscellany of animals which he kept there. He was a cracker of jokes and fond of music, and sang some poems composed by himself on indecorous subjects. In his art Vasari alleges that Bazzi was always negligent—his early success in Siena, where he painted many portraits, being partly due to want of competition. As he advanced in age he became too lazy to make any cartoons for his frescoes, but daubed them straight off upon the wall. Vasari admits, nevertheless, that Bazzi produced at intervals some works of very fine quality, and during his lifetime his reputation stood high.

The general verdict is that Bazzi was an able master in expression, motion and colour. His taste was something like that of Da Vinci, especially in the figures of women, which have grace, sweetness and uncommon earnestness. He is not eminent for drawing, grouping or general elegance of form. His easel pictures are rare; there are two in the National Gallery in London.

It is uncertain whether Bazzi was a pupil of Leonardo da Vinci, though Morelli (in his *Italian Pictures in German Galleries*) speaks of his having "only ripened into an artist during the two years (1498–1500) he spent at Milan with Leonardo"; and some critics see in Bazzi's "Madonna" in the Brera (if it is really by Bazzi) the direct influence of this master. Modern criticism follows Morelli in supposing that Raphael painted Bazzi's portrait in "The School of Athens"; and a drawing at Christ Church is supposed to be a portrait of Raphael by Bazzi.

His most celebrated works are in Siena. In S. Domenico, in the chapel of St Catherine of Siena, are two frescoes painted in 1526, showing Catherine in ecstasy, and fainting as she is about to receive the Eucharist from an angel—a beautiful and pathetic treatment. In the oratory of S. Bernardino, scenes from the history of the Madonna, painted by Bazzi in conjunction with Pacchia and Beccafumi (1536–1538)—the "Visitation" and the "Assumption"—are noticeable. In S. Francesco are the "Deposition from the Cross" (1513) and "Christ Scourged"; by many critics one or other of these paintings is regarded as Bazzi's masterpiece. In the choir of the cathedral at Pisa is the "Sacrifice of Abraham," and in the Uffizi Gallery of Florence as "St Sebastien."

See for further details, *Giovanni Antonio Bazzi*, by Robert H. Hobart Cust (1906), which contains a full bibliography. (W. M. R.)

SODOR AND MAN, the name of the bishopric of the Church of England which includes the Isle of Man and adjacent islets. In 1154 the diocese of Sodor was formed to include the Hebrides and other islands west of Scotland (Norse *Sudr-eyjar*, Sudreys, or southern isles, in distinction from *Nordr-eyjar*, the northern isles of Orkney and Shetland) and the Isle of Man. It was in the archdiocese of Trondhjem in Norway. (The connexion of the Isle of Man with Norway is considered *s.v.* MAN, ISLE OF). A Norwegian diocese of Sodor had been in existence previously, but its history is obscure, and the first union of Man with it in 1098 by Magnus Barefoot is only traditional. The Norwegian connexion was broken in 1266, and in 1334 Man was detached from the Scottish islands. The cathedral of Sodor was on St Patrick's Isle at Peel (*q.v.*), and it is possible that the name Sodor being lost, its meaning was applied to the isle as the seat of the bishop. The termination "and Man" seems to have been added in the 17th century by a legal draughtsman ignorant of the proper application of the name of Sodor to the bishopric of Man. By the latter part of the 16th century the terms Sodor and Man had become interchangeable, the bishopric being spoken of as that of Sodor or Man. Till 1604 the bishops invariably signed themselves *Sodorensis*; after that date and till 1684, sometimes *Soderensis* and sometimes "Sodor and Man," and after 1684 always "Sodor and Man." The see, while for some purposes in the archdiocese of York, has its own convocation. The bishop sits in the House of Lords, but has no vote.

See A. W. Moore, *History of the Isle of Man* (London, 1900).

SOEST, a town of Germany, in the Prussian province of Westphalia, situated in a fertile plain (*Soester Börde*), 33 m. E.

of Dortmund, on the main railway Cologne-Elberfeld-Berlin. Pop. (1905), 17,394. Its early importance is attested by its seven fine churches (six Protestant), of which the most striking are St Peter's, the Wiesenkirche, a gem of Gothic architecture, Maria zur Höhe—St Mary-on-the-height—with beautiful mural frescoes, founded in 1314 and restored in 1850–1852, and the Roman Catholic cathedral, founded in the 10th century by Bruno, brother of Otto the Great (the present building was erected in the 12th century). This last, with its very original façade, is one of the noblest ecclesiastical monuments of Germany. Remains of the broad wall, now partly enclosing gardens and fields, and one of the gates remain; but the thirty-six strong towers which once defended the town have disappeared and the moats have been converted into promenades. The town-hall (1701) contains valuable archives, and among the numerous educational establishments must be mentioned the gymnasium, founded in 1534, through the instrumentality of Melanchthon, an evangelical teachers' seminary, an agricultural school, and a blind asylum. Iron-working, the manufacture of soap, hats, sugar, cigars, bricks and tiles, linen-weaving, tanning and brewing, together with market-gardening and farming in the neighbourhood, and trade in cattle and grain are the leading industries.

Mentioned in documents as early as the 9th century, Soest was one of the largest and most important Hanseatic towns in the middle ages, with a population estimated at from 30,000 to 60,000. It was one of the chief emporiums on the early trading route between Westphalia and Lower Saxony. Its code of municipal laws (*Schran; jus susatense*), dating from 1144 to 1165, was one of the earliest and best, and served as a model even to Lübeck. On the fall of Henry the Lion, duke of Saxony, Soest passed with the rest of Angria to Cologne. In the 15th century the strife between the towns-men and the archbishops broke out in open war, and in 1444 the strong fortifications of the town withstood a long siege by an army of 60,000 men. The women of Soest are said to have distinguished themselves in this contest (*Soester Fehde*). Papal intervention ended the strife, and Soest was permitted to remain under the protection of the dukes of Cleves. The prosperity of the town waned in more modern times: in 1763 its population was only 3800; in 1816 it was 6687.

See Vogeler, *Soest, seine Altertümer und Sehenswürdigkeiten* (Soest, 1890); Hausberg, *Die soester Fehde* (Trier, 1882); Sümmermann, *Die Wandmalereien in der Kirche Maria zur Höhe in Soest* (Soest, 1890); Aldenkirchen, *Die mittelälterliche Kunst in Soest* (Bonn, 1875); Ludorff und Vogeler, *Kunstdenkmäler des Kreises Soest* (Soest, 1905).

SOFA, a long couch with stuffed back, arms and seat, to hold two or more persons. The word is of Arabic origin, and is an adaptation of *suffah*, couch, from root *saffa*—to draw up in line. According to Richardson, *Dict. of Eng. Lang.* quoted by Skeat, the Arabic *suffah* was particularly a reclining place of wood or stone placed before the doors of Oriental houses. In the history of furniture the sofa was a development of the straight backed settee. It was not so much therefore a long chair or combination of chairs, as a seat or couch for reclining. The early 19th-century type had a back with a single arm at one end, the other being left open. The most favoured modern form is that known as the Chesterfield, with double arms and back, heavily padded. (See also SETTEE.)

SOFALA, a Portuguese seaport on the east coast of Africa, at the mouth of a river of the same name, in 20° 12′ S. Pop. (1900), about 1000. The town possesses scarcely a trace of its former importance, and what trade it had was nearly all taken away by the establishment of Beira (*q.v.*) a little to the north in 1890. Sofala Harbour, once capable of holding a hundred large vessels, is silting up and is obstructed by a bar. Ruins exist of the strong fort built by the Portuguese in the 16th century. Previous to its conquest by the Portuguese in 1505 Sofala was the chief town of a wealthy Mahommedan state, Arabs having established themselves there in the 12th century or earlier. At one time it formed part of the sultanate of Kilwa (*q.v.*). Sofala was visited by the Portuguese Jew, Pero de Covilhão, in 1489, who was attracted thither by the reports of gold-mines of which Sofala was the port. The conquest of the town followed, the first governors of the Portuguese East African possessions being entitled Captains-General of Sofala. (See PORTUGUESE EAST AFRICA.) Thomé Lopes, who accompanied Vasco da Gama to India in 1502 and left a narrative of the voyage (first printed in Ramusio, *Viaggi e Navegationi*), identifies Sofala with Solomon's Ophir and states that it was the home of the Queen of Sheba. This identification of Sofala with Ophir, to which Milton alludes (*Par. Lost*, xi. 399–401) is untenable.

The small island of Chiloane, with a good harbour, 40 m. S. of Sofala, has been colonized from Sofala (the township being named Chingune) as has also the island Santa Carolina, in the Bazaruto archipelago.

See *Bull. Geogr. Soc. Mozambique* (1882) for an account of the Sofala mines; and, generally, Idrísí, *Climate*, i. § 8. O. Dapper, *Description de l'Afrique* (Amsterdam, 1686); T. Baines, *The Gold Regions of South Africa* (1877); G. McC. Theal's *Records of South Eastern Africa* (1898–1903); Sir R. Burton's notes to his edition of Camoens.

SOFFIONI (sometimes spelt *suffioni*), a name applied in Italy to certain volcanic vents which emit jets of steam, generally associated with hydrogen sulphide and carbon dioxide, sometimes also with a little ammonia and marsh-gas. The soffioni are usually arranged in groups, and are best represented in the Maremma of Tuscany, where they contain a small proportion of boric acid, for which they are utilized industrially. For such natural steam-holes, the French geologists often use the term *soufflards* in place of the Italian soffioni.

SOFFIT (from Fr. *soffite*, Ital. *soffitta*, a ceiling, formed as if from *suffictus* for *suffixus*, Lat. *suffigere*, to fix underneath), a term in architecture given to the underside of any constructional feature; as for instance that of an arch or an architrave whether supported by piers or columns; also to the underside of a flight of stairs, and in the classic entablature to the under-side of the projecting cornice.

SOFIA (Bulgarian *Sredetz*, the middle town, a name now little used), the capital of Bulgaria, situated almost in the centre of an upland plain, about 1700 ft. above sea-level, between the Western Balkans on the N. and Mt Vitosh on the S. Pop. (1907) 82,187. Two small tributaries of the river Isker, the Perlovetz and the Eleshnitza or Boyana, flow respectively on the east and west sides of the town. Since 1880 the city has been almost entirely renovated in the "European" style; the narrow tortuous lanes and mean houses of the Turkish epoch have almost disappeared, and a new town with straight parallel streets has been constructed in the eastern suburb. The oldest building in Sofia is the little round chapel of St George in the Jewish quarter—originally, it is said, a Roman temple; then a church, then a mosque, and now a church once more. Of the principal mosques the large Buyuk Djamía, with nine metal cupolas, has become the National Museum; the Tcherna Djamía or Black Mosque, latterly used as a prison, has been transformed into a handsome church; the Banya-bashi Djamía, with its picturesque minaret, is still used by Moslem worshippers. Close to the last-named in the centre of the town, are the public baths with hot springs (temperature 117° F). In the cathedral or church of Sveti Kral (the Saint King), a modern building, are preserved the remains of the Servian king Stefan Urosh II. A large new cathedral dedicated to St Alexander Nevski was in course of construction in 1907; the foundation stone was taken from the church of St Sophia. The palace of the prince, occupying the site of the Turkish konak was built by Prince Alexander in 1880–1882; it has been greatly enlarged by King Ferdinand. In front of the palace is the public garden or Alexander Park. The theatre, the largest in south-eastern Europe, was completed in 1906. Other important buildings are the Sobranye, or parliament house, the palace of the synod, the ministries of war and commerce, the university with the national printing press, the national library, the officers' club and several large military structures. A small mausoleum contains the remains of Prince Alexander; there are monuments to the tsar Alexander II., to Russia, to the medical officers who fell in the war of 1877 and to the patriot Levsky. A public park has been laid out in the eastern suburbs. The city is well drained and possesses a good water supply; it is lighted by electricity and has an electric car system. It contains breweries, tanneries, sugar, tobacco, cloth, and silk factories, and exports skins, cloth, cocoons, cereals, attar of roses, dried fruit, &c. Sofia forms the centre of a railway system radiating to Constantinople (300 m.), Belgrade (206 m.) and central Europe, Varna, Rustchuk and the Danube, and Kiustendil near the Macedonian frontier. The climate is healthy; owing to the elevated situation it is somewhat cold, and is liable to sudden diurnal and seasonal changes; the temperature in January sometimes falls to 4° F. below zero and in August rises to 100°. The population, of which more than two-thirds are Bulgarians, and about one-sixth Spanish Jews, was 20,501 in 1881, 30,428 in 1888, 46,593 in 1893 and 82,187 in 1907.

History.—The colony of Serdica, founded here by the emperor Trajan, became a Roman provincial town of considerable importance in the 3rd and 4th centuries A.D., and was a favourite residence of Constantine the Great. Serdica was burnt by the Huns in A.D. 447; few traces remain of the Roman city, but more than one hundred types of its coins attest its importance. The town was taken by the Bulgarians under Krum in A.D. 809; the name Serdica was converted into Sredetz by the Slavs, who associated it with *sreda* (middle), and the Slavonic form subsequently became the Byzantine Triaditza. The name Sofia, which came into use towards the end of the 14th century is derived from the early medieval church of St Sophia, the massive ruins of which stand on an eminence to the east of the town. The church, which was converted into a mosque by the Turks, was partly destroyed by earthquakes in 1818 and 1858. The town successfully resisted the attacks of the emperor Basil II. in 987; between 1018 and 1186, under Byzantine rule, it served as a frontier fortress. During this period a number of prisoners of the Petcheneg tribe were settled in the neighbourhood, in all probability the ancestors of the Shôp tribe which now inhabits the surrounding districts. In 1382 Sofia was captured by the Turks; in 1443 it was for a brief time occupied by the Hungarians under John Hunyady. Under Turkish rule the city was for nearly four centuries the residence of the beylerbey or governor-general of the whole Balkan Peninsula except Bosnia and the Morea. During this period the population increased and became mainly Turkish; in 1553 the town possessed eleven large and one hundred small mosques. In the latter half of the 15th century Sofia, owing to its situation at the junction of several trade routes, became an important centre of Ragusan commerce. During the Turco-Russian campaign of 1829 it was the headquarters of Mustafa Pasha of Skodra, and was occupied by the Russians for a few days. On the 4th of January 1878 a Russian army again entered Sofia after the passage of the Balkans by Gourko; the bulk of the Turkish population had previously taken flight. Though less central than Philippopolis and less renowned in Bulgarian history than Trnovo, Sofia as selected as the capital of the newly-created Bulgarian state in view of its strategical position, which commands the routes to Constantinople, Belgrade, Macedonia and the Danube. (J. D. B.)

SOGDIANA (Sugdiane, O. Pers. *Sughuda*), a province of the Achaemenian Empire, the eighteenth in the list in the Behistun inscription of Darius (i. 16), corresponding to the modern districts of Samarkand and Bokhara; it lay north of Bactriana between the Oxus and the Jaxartes, and embraced the fertile valley of the Zerafshan (anc. Polytimetus). Under the Greeks Sogdiana was united in one satrapy with Bactria, and subsequently it formed part of the Bactrian Greek kingdom till the Scythians (see SCYTHIA) occupied it in the middle of the 2nd century B.C. The valley of the Zerafshan about Samarkand retained even in the middle ages the name of the Soghd of Samarkand. Arabic geographers reckon it as one of the four fairest districts in the world.

SOGNE FJORD, a great inlet of the west coast of Norway, penetrating the mainland to a distance of 136 m. It is the longest fjord in Norway, and the deepest, approaching 700 fathoms in some parts. Sognefest at its entrance is 50 m. by water from Bergen, in 61° 5′ N. The general direction from the sea is easterly. For the first 50 m. the sombre flanking mountains are unbroken by any considerable branch, but from this point several deep, narrow inlets ramify, penetrating the Jostedalsbrae and Jotunfjeld to the north and the northward extension of the Hardangerfjeld to the south, walled in at their heads by snow-clad mountains and frequented by travellers on account of the magnificent scenery. The principal are Fjaerlands, Sogndals and Lyster fjords to the north, Aardals fjord to the east, Laerdals and Aurlands fjords to the south. From the last branches the Naerö fjord, with a precipitous valley of great beauty (Naerödalen) at its head, traversed by a road, from Gudvangen on the fjord, across the Stalheim Pass to Vossevangen. The other principal villages are Vadheim on the outer fjord, the terminus of the road from Nordfjord; Balholm and Fjaerland (centres for visiting the fine glaciers of Jostedal); Lekanger, Sogndal, and Laerdalsören, whence a road strikes south-east for the Valders and Hallingdal districts.

SOHAM, a town in the Newmarket parliamentary division of Cambridgeshire, England, 5 m. S.E. of Ely by a branch of the Great Eastern railway. Pop. (1901), 4230. It lies in the midst of the flat fen country. To the west a rich tract, still known as Soham Mere, marks the place of one of the many wide and shallow sheets of water in the district now drained. The church of St Andrew is cruciform and had formerly a central tower; the existing western tower is of fine and ornate Perpendicular work. The body of the church, however, is mainly transitional Norman with additions principally Decorated, including a beautiful east window, much ancient woodwork, and other details of interest. The grammar school dates from 1687. The road from Soham to Ely was constructed as a causeway across the fens by Hervey le Breton, first bishop of Ely (1109–1131). The trade of the town is agricultural, fruit-growing and market-gardening being largely carried on in the vicinity.

SOIGNIES (or SOIGNES, the Walloon form), a busy and flourishing town of the province of Hainaut, owing its prosperity to the important blue granite quarries in the neighbourhood. It contains a fine abbey church of the 12th century and in the cemetery connected with it are many tombstones of the 13th and 14th centuries. Pop. (1904), 10,480.

The forest of Soignies extended in the middle ages over the southern part of Brabant up to the walls of Brussels, and is immortalized in Byron's *Childe Harold*. Originally it was part of the Ardenne forest, and even at the time of the French Revolution it was very extensive. The first blow towards its gradual contraction was struck when Napoleon ordered 22,000 oaks to be cut down in it to build the celebrated Boulogne flotilla for the invasion of England. King William I. of the Netherlands continued the process in the belief that he was thus adding to the prosperity of the country, and from 29,000 acres in 1820 the forest was reduced to 11,200 in 1830. A considerable portion of the forest in the neighbourhood of Waterloo was assigned in 1815 to the duke of Wellington, and to the holder of the title as long as it endured. This portion of the forest was only converted into farms in the time of the second duke. The Bois de la Cambre (456 acres) on the outskirts of Brussels was formed out of the forest, and beyond it stretches the Forêt de Soignies, still so called, to Tervueren, Groenendael, and Argenteuil close to Mont Saint Jean and Waterloo.

SOIL,[1] the term generally applied to that part of the earth's

[1] This word comes through O. Fr. *soil* from a Late Latin usage of *solea* for soil or ground, which in classic Lat. meant the sole of the foot, also a sandal. This was due to a confusion with *solum*, ground, whence Fr. *sol*. Both *solea* and *solum* are, of course, from the same root. To be distinguished from this word is "soil," to make dirty, to stain, defile. The origin is the O. Fr. *soil* or *souil*, the miry wallowing ground of a wild boar, whence the hunting phrase "to take soil," of a beast of the chase taking to water or marshy ground. The derivation is therefore from Lat. *soillus*, pertaining to

substance which is stirred or tilled by implements such as ploughs and spades. Below this is the *subsoil.* The soil through being acted upon by the air, heat, frost and other agencies usually consists of finer particles than those comprising the bulk of the subsoil. It contains more roots, and as a rule, is darker in colour than the subsoil on account of the larger proportion of decaying vegetable matter present in it: it is also looser in texture than the subsoil. The subsoil not unfrequently contains materials which are deleterious to the growth of crops, and roots descending into it may absorb and convey these poisonous substances to other parts of the plant or be themselves damaged by contact with them. On this account deeper tillage than usual, which allows of easier penetration of roots, or the carrying out of operations which bring the subsoil to the surface, must always be carefully considered.

At first sight few natural materials appear to be of less interest than the soil; yet its importance is manifest on the slightest reflection. From it, directly or indirectly, are obtained all food materials needed by man and beast. The inorganic materials within it supply some of the chief substances utilized by plants for their development and growth, and from plants animals obtain much of their sustenance.

Origin of the Soil.—It is a matter of common observation that stones of monuments, walls or buildings which are exposed to the air sooner or later become eaten away or broken up into small fragments under the influence of the weather. This disintegration is brought about chiefly by changes in temperature, and by the action of the rain, the oxygen, and the carbon dioxide of the air. During the daytime the surface of the stone may become very warm, while at night it is speedily cooled. Such alterations in temperature produce strains which frequently result in the chipping off of small fragments of the material composing the stone. Moreover the rain penetrates into the small interstices between its particles and dissolves out some of the materials which bind the whole into a solid stone, the surface then becoming a loose powdery mass which falls to the ground below or is carried away by the wind. The action of frost is also very destructive to many stones, since the water within their cracks and crannies expands on freezing and splits off small pieces from their surfaces. In the case of limestones the carbon dioxide of the air in association with rain and dew eats into them and leads to their disintegration. The oxygen of the air may also bring about chemical changes which result in the production of soluble substances removable by rain, the insoluble parts being left in a loosened state.

These " weathering " agents not only act upon stones of buildings, but upon rocks of all kinds, reducing them sooner or later into a more or less fine powder. The work has been going on for ages, and the finely comminuted particles of rocks form the main bulk of the soil which covers much of the earth's surface, the rest of the soil being composed chiefly of the remains of roots and other parts of plants.

If the whole of the soil in the British Islands were swept into the sea and the rocks beneath it laid bare the surface of the country would ultimately become covered again with soil produced from the rocks by the weathering processes just described. Moreover where there was no transport or solution of the soil thus produced it would necessarily show some similarity in composition to the rock on which it rested. The soils overlying red sandstone rocks would be reddish and of a sandy nature, while those overlying chalk would be whitish and contain considerable amounts of lime. In many parts of the country soils exhibiting such relationships, and known as *sedentary* soils, are prevalent, the transition from the soil to the rock beneath being plainly visible in sections exposed to view in railway cuttings, quarries and other excavations. The upper layer or soil proper consists of material which has been subjected to ages of weathering; the bulk of it is composed of finely comminuted particles of sand, clay and other minerals, among which are imbedded larger or smaller stones of more refractory nature. On descending into the substratum the finer material decreases and more stones are met with; farther down are seen larger fragments of unaltered rock closely packed, and this brash or rubble grades insensibly into the unbroken rock below.

In many districts the soil is manifestly unconnected in origin with the rock on which it rests, and differs from it in colour, composition and other characters. There are *transported* or drift soils, the particles of which have been brought from other areas and deposited over the rocks below. Some of the stiff boulder clays or " till " so prevalent over parts of the north of England appear to have been deposited from ice sheets during the glacial period. Perhaps the majority of drift soils, however, have been moved to their present position by the action of the water of rivers or the sea.

As fast as the rock of a cliff is weathered its fragments are washed to the ground by the rain, and carried down the slopes by small streams, ultimately finding their way into a river along which they are carried until the force of the water is insufficient to keep them in suspension, when they become deposited in the river bed or along its banks. Such river-transported material or *alluvium* is common in all river valleys. It is often of very mixed origin, being derived from the detritus of many kinds of rocks, and usually forms soil of a fertile character.

Quality of Soil.—The good or bad qualities of a soil have reference to the needs of the crops which are to be grown upon it, and it is only after a consideration of the requirements of plants that a clear conception can be formed of what characters the soil must possess for it to be a suitable medium on which healthy crops can be raised.

In the first place, soil, to be of any use, must be sufficiently loose and porous to allow the roots of plants to grow and extend freely. It may be so compact that root development is checked or stopped altogether, in which case the plant suffers. On the other hand it should not be too open in texture or the roots do not get a proper hold of the ground and are easily disturbed by wind: moreover such soils are liable to blow away, leaving the underground parts exposed to the air and drought.

The roots like all other parts of plants contain protoplasm or living material, which cannot carry on its functions unless it is supplied with an adequate amount of oxygen: hence the necessity for the continuous circulation of fresh air through the soil. If the latter is too compact or has its interstices filled with carbon dioxide gas or with water—as is the case when the ground is water-logged—the roots rapidly die of suffocation just as would an animal under the same conditions. There is another point which requires attention. Plants need very considerable amounts of water for their nutrition and growth; the water-holding capacity is, therefore, important. If the soil holds too much it becomes water-logged and its temperature falls below the point for healthy growth, at any rate of the kinds of plants usually cultivated on farms and in gardens. If it allows of too free drainage drought sets in and the plants, not getting enough water for their needs, become stunted in size. Too much water is bad, and too little is equally injurious.

In addition, the temperature of the soil largely controls the yield of crops which can be obtained from the land. Soil whose temperature remains low, whether from its northerly aspect or from its high water content or other cause, is unsatisfactory, because the germination of seeds and the general life processes of plants cannot go on satisfactorily except at certain temperatures well above freezing-point.

A good soil should be deep to allow of extensive root development and, in the case of arable soils, easy to work with implements. Even when all the conditions above mentioned in regard to texture, water-holding capacity, aeration and temperature are suitably fulfilled the soil may still be barren: plant food-material is needed. This is usually present in abundance although it may not be available to the plant under certain

swine, *sus.* " To sully," to besmirch, to cover with " mire " (O. Eng. *sol* cf. Ger *sühlen*) is a quite distinct word. Lastly there is a form " soil," used by agriculturists, of the feeding and fattening of cattle with green food such as vetches. This is from O. Fr. *saoler*, *saouler*, mod. *soûler*, Lat. *satullus*, full-fed (*satur*, satiated, *satis*, enough).

circumstances, or may need to be replenished or increased by additions to the soil of manures or fertilizers (see MANURE).

Chief Constituents of the Soil.—An examination of the soil shows it to be composed of a vast number of small particles of sand, clay, chalk and humus, in which are generally imbedded larger or smaller stones. It will be useful to consider the nature of the four chief constituents just mentioned and their bearing upon the texture, water-holding capacity and other characters which were referred to in the previous section.

Sand consists of grains of quartz or flint, the individual particles of which are large enough to be seen with the unaided eye or readily felt as gritty grains when rubbed between the finger and thumb. When a little soil is shaken up with water in a tumbler the sand particles rapidly fall to the bottom and form a layer which resembles ordinary sand of the seashore or river banks. Chemically pure sand is silicon dioxide (SiO_2) or quartz, a clear transparent glass-like mineral, but as ordinarily met with, it is more or less impure and generally coloured reddish or yellowish by oxide of iron. A soil consisting of sand entirely would be very loose, would have little capacity to retain water, would be liable to become very hot in the daytime and cool at night and would be quite unsuitable for growth of plants.

The term clay is often used by chemists to denote hydrated silicate of alumina ($Al_2O_3 \cdot 2SiO_2 \cdot 2H_2O$), of which kaolin or china clay is a fairly pure form. This substance is present in practically all soils but in comparatively small amounts. Even in the soils which farmers speak of as stiff clays it is rarely present to the extent of more than 1 or 2%. The word "clay" used in the agricultural sense denotes a sticky intractable material which is found to consist of exceedingly fine particles (generally less than ·005 mm. in diameter) of sand and other minerals derived from the decomposition of rocks, with a small amount of silicate of alumina. The peculiar character which clay possesses is probably due not to its chemical composition but to its physical state. When wet it becomes sticky and almost impossible to move or work with farm implements; neither air nor water can penetrate freely. In a dry state it becomes hard and bakes to a brick. It holds water well and is consequently cold, needing the application of much heat to raise its temperature. It is obvious, therefore, that soil composed entirely of clay is as useless as pure sand so far as the growth of crops upon it is concerned.

Chalk consists, when quite pure, of calcium carbonate ($CaCO_3$), a white solid substance useful in small amounts as a plant food-material, though in excess detrimental to growth. Alone, even when broken up into small pieces, it is unsuitable for the growth of plants.

Humus, the remaining constituent of soil, is the term used for the decaying vegetable and animal matter in the soil. A good illustration of it is peat. Its water-holding capacity is great, but it is often acid, and when dry it is light and incapable of supporting the roots of plants properly. Few of the commonly cultivated crops can live in a soil consisting mainly of humus.

From the above account it will be understood that not one of the four chief soil constituents is in itself of value for the growth of crops, yet when they are mixed, as they usually are in the soils met with in nature, one corrects the deficiencies of the other. A perfect soil would be such a blend of sand, clay, chalk and humus as would contain sufficient clay and humus to prevent drought, enough sand to render it pervious to fresh air and prevent water-logging, chalk enough to correct the tendency to acidity of the humus present, and would have within it various substances which would serve as food-materials to the crops.

Generally speaking, soils containing from 30 to 50% of clay and 50 to 60% of sand with an adequate amount of vegetable residues prove the most useful for ordinary farm and garden crops; such blends are known as "loams," those in which clay predominates being termed clay loams, and those in which the sand predominates sandy loams. "Stiff clays" contain over 50% of clay; "light sands" have less than 10%. In the mechanical analysis of the soil, after separation of the stones and fine gravel by means of sieves, the remainder of the finer earth is subjected to various processes of sifting and deposition from water with a view of determining the relative proportions of sand, silt and clay present in it. Most of the material termed "sand" in such analyses consists of particles ranging in diameter from ·5 to ·05 mm., and the "silt" from ·05 to ·005 mm., the "clay" being composed of particles less than ·005 mm. in diameter. The proportional amount of these materials in a sandy soil on the Bagshot beds and a stiff Oxford clay is given below:—

	Soil on Bagshot Beds.	Soil on Oxford Clay.
Coarse sand 1–·2 mm.	32 %	11 %
Fine sand ·2–·04 mm.	40 ,,	11 ,,
Silt ·04–·01 mm.	12 ,,	19 ,,
Fine silt ·01–·004 mm.	8 ,,	19 ,,
Clay below ·004 mm.	8 ,,	40 ,,

The pore-space within the soil, *i.e.* the space between the particles composing the soil, varies with the size of these particles and with the way they are arranged or packed. It is important, since upon it largely depends the movement of air and water in the land. It is generally from 30 to 50% of the total volume occupied by the soil.

Where the soil grains are quite free from each other the smaller grains tend to fill up the spaces between the larger ones; hence it might be concluded that in clays the amount of pore-space would be less than in coarser sands. This is the case in "puddled" clays, but in ordinary clay soils the excessively minute particles of which they largely consist tend to form groups of comparatively large composite grains and it is in such natural soils that the pore-space is largest.

Chemical Composition of the Soil.—It has been found by experiment that plants need for their nutritive process and their growth, certain chemical elements, namely, carbon, hydrogen, oxygen, nitrogen, sulphur, phosphorus, potassium, magnesium, calcium and iron. With the exception of the carbon and a small proportion of the oxygen and nitrogen, which may be partially derived from the air, these elements are taken from the soil by crops. The following table shows the amounts of the chief constituents removed by certain crops in ℔ per acre:—

Crop.	Nitrogen.	Phosphoric Acid.	Potash.	Lime.	Magnesia.
	℔	℔	℔	℔	℔
Wheat	50	21	29	9	7
Meadow hay	49	12	51	32	14
Turnips	110	33	149	74	9
Mangels	149	53	300	43	42

Plants also remove from the soil silicon, sodium, chlorine, and other elements which are, nevertheless, found to be unessential for the growth and may therefore be neglected here.

Leguminous crops take some of the nitrogen which they require from the air, but most plants obtain it from the nitrates present in the soil. The sulphur exists in the soil chiefly in the form of sulphates of magnesium, calcium and other metals; the phosphorus mainly as phosphates of calcium, magnesium and iron; the potash, soda and other bases as silicates and nitrates; calcium and magnesium carbonates are also common constituents of many soils.

In the ordinary chemical analyses of the soil determinations are made of the nitrogen and various carbonates present as well as of the amount of phosphoric acid, potash, soda, magnesia and other components soluble in strong hydrochloric acid.

Below are given examples of the analyses of a poor sandy soil and an ordinary loam:—

	Poor sandy Soil on Bagshot Beds.	Loam or Lias.
Nitrogen	·19 %	·17 %
Phosphoric acid	·18 ,,	·32 ,,
Potash	·19 ,,	·57 ,,
Carbonate of Lime	·23 ,,	1·22 ,,

Since the dry weight of the first foot of soil over an acre is about 4,000,000 ℔ the poor sandy soil contains within it:—

Nitrogen	7,600 ℔
Phosphoric acid	7,200 ,,
Potash	7,600 ,,
Lime	9,200 ,,

From the figures given previously of the amount of nitrogen, potash and phosphoric acid removed by a wheat or mangel crop it would appear that this soil has enough of these ingredients in it to yield many such crops; yet experience has shown that these crops cannot be grown on such a poor sandy soil unless manures containing phosphates, potash and nitrogen are added.

Many attempts have been made to correlate the results of the analyses of a soil with its known cropping power, but there is yet much to be learnt in regard to these matters. A great proportion of the food constituents which can be extracted by strong hydrochloric acid are not in a condition to be taken up by the roots of plants; they are present, but in a "dormant" state, although by tillage and weathering processes they may in time become "available" to plants. Analyses of this character would appear to indicate the permanent productive capacity of the soil rather than its immediate power of growing a crop.

Soils containing less than ·25% of potash are likely to need special application of potash fertilizers to give good results, while those containing as much as ·4 or ·5% do not usually respond to those manures. Where the amount of phosphoric acid (P_2O_5) is less than ·05% phosphatic manures are generally found to be beneficial; with more than ·1% present these fertilizers are not usually called for except perhaps in soils containing a high percentage of iron compounds. Similarly soils with less than ·1 % of nitrogen are likely to be benefited by applications of nitrogenous manures. Too mueh stress, however, cannot be laid upon these figures, since the fertility of a soil is very greatly influenced by texture and physical constitution, perhaps more so by these factors than by chemical composition.

At present it is not possible to determine with aeeuraey the amount of immediately available plant food-constituents in a soil: no doubt the various species of plants differ somewhat in their power of absorbing these even from the same soil. The method introdueed by Dyer of dissolving out the mineral constituents of the soil with a 1 % solution of citric acid, which represents about the average acidity of the roots of most eommon plants, yields better results. In the case of arable soils, where the amount of phosphoric acid determined by this method falls below ·01 %, phosphatie manuring is essential for good erops. The writer has found that many pasture soils containing less than ·025 or ·03 %, respond freely to applications of phosphates; probably in such eases even the weak acid is capable of dissolving out phosphates from the humus or other compounds which yield little or none to the roots of grasses and elovers. In soils where the potash available to citrie acid is less than ·005 %, kainit and other potash fertilizers are needed.

Water in the Soil.—The importanee of an adequate supply of water to growing erops eannot well be over-estimated. During the life of a plant there is a continuous stream of water passing through it which enters by the root-hairs in the soil and after passing along the stem is given off from the stomata of the leaves into the open air above ground. It has been estimated that an acre of cabbage will absorb from the land and transpire from its leaves more than ten tons of water per day when the weather is fine.

In addition to its usefulness in maintaining a turgid state of the young eells without which growth cannot proceed, water is itself a plant food-material and as absorbed from the soil eontains dissolved in it all the mineral food constituents needed by plants for healthy nutrition. Without a suffieient supply plants remain stunted and the crop yield is seriously reduced, as we see in dry seasons when the rainfall is much below the average. If one condition is more necessary than another for good erops it is a suitable supply of water, for no amount of manuring or other treatment of the soil will make up for a deficient rainfall. The amount needed for the most satisfactory nutrition varies with different plants. In the case of fair average farm crops it has been shown that for the produetion of one ton of dry matter contained in them from 300 to 500 tons of water has been absorbed and utilized by the plants. This may be more than the rainfall, in which ease irrigation or special control of the water supply may be necessary.

The water-holding capaeity of a soil depends upon the amount of free space between the partieles of which it is composed into which water can enter. In most eases this amounts to from 30 to 50 % of the volume of the soil.

When the pore-spaee of the soil is filled with water it becomes water-logged and few plants ean effect absorption by their roots under sueh eonditions. The root-hairs die from want of air, and the whole plant soon suffers. Fields of wheat and other eereals rarely recover after a week's submergence, but orchards and many trees when at rest in winter withstand a flooded or water-logged eondition of the soil for two or three weeks without damage. The most satisfactory growth is maintained when the amount of water present is not more than 40 to 60 % of what would saturate it. Under such conditions each partiele of soil is surrounded by a thin film of water and in the pore-spaee air ean freely circulate. It is from such films that the root-hairs absorb all that plants require for their growth. The movement of water into the root-hairs is brought about by the osmotic aetion of certain salts in their cell-sap. Crops are, however, unable to absorb all the water present in the soil, for when the films become very thin they are held more firmly or cling with more force to the soil particles and resist the osmotie action of the root-hairs. Plants have been found to wither and die in sandy soils containing 1½ % of water, and in elay soils in whieh there was still present 8 % of water.

When a long glass tube open at both ends is filled with soil and one end is dipped in a shallow basin of water, the water is found to move upwards through the soil column just as oil will rise in an ordinary lamp wick. By this eapillary action water may be transferred to the upper layers of the soil from a depth of several feet below the surface. In this manner plants whose roots descend but a little way in the ground are enabled to draw on deep supplies. Not only does water move upwards, but it is transferred by capillarity in all directions through the soil. The amount and speed of movement of water by this means, and the distance to which it may be carried, depend largely upon the fineness of the particles eomposing the soil and the spaees left between eaeh. The ascent of water is most rapid through eoarse sands, but the height to which it will rise is eomparatively small. In clays whose particles are exceedingly minute the water travels very slowly but may ultimately reach a height of many feet above the level of the "water-table" below. While this capillary movement of water is of great importance in supplying the needs of plants it has its disadvantages, since water may be transferred to the surfaee of the soil, where it evaporates into the air and is lost to the land or the erop growing upon it. The loss in this manner was found to be in one instance over a pound of water per day per square foot of surfaee, the "water-table" being about 4 or 5 ft. below.

One of the most effective means of conserving soil moisture is by "mulching," *i.e.* by eovering the surface of the soil with some loosely compacted material such as straw, leaf-refuse or stable-manure. The space between the parts of such substanees is too large to admit of capillary action; hence the water conveyed to the surface of the soil is prevented from passing upwards any further exeept by slow evaporation through the mulehing layer. A loose layer of earth spread over the surface of the soil acts in the same way, and a similarly effective mulch may be prepared by hoeing the soil, or stirring it to a depth of one or two inches with harrows or other implements. The hoe and harrow are therefore exeellent tools for use in dry weather. Rolling the land is beneficial to young erops in dry weather, since it promotes capillary aetion by redueing the soil spaces. It should, however, be followed by a light hoeing or harrowing.

In the semi-arid regions of the United States, Argentina and other countries where the average annual rainfall lies between 10 to 20 in., irrigation is necessary to obtain full crops every year. Good crops, however, ean often be grown in sueh areas without irrigation if attention is paid to the proper circulation of water in the soil and means for retaining it or preventing exeessive loss by evaporation. Of course care must be excrcised in the seleetion of plants—such as sorghum, maize, wheat, and alfalfa or lucerne—whieh are adapted to dry conditions and a warm climate.

So far as the water-supply is concerned—and this is what ultimately determines the yield of erops—the rain whieh falls upon the soil should be made to enter it and percolate rapidly through its interstiees. A deep porous bed in the upper layers is essential, and this should consist of fine particles which lie elose to eaeh other without any tendency to stick together and "puddle" after heavy showers. Every effort should be made to prepare a good mealy tilth by suitable ploughing, harrowing and consolidation.

In the operation of ploughing the furrow slice is separated from the soil below, and although in humid soils this layer may be left to settle by degrees, in semi-arid regions this loosened layer becomes dry if left alone even for a few hours and valuable water evaporates into the air. To prevent this various implements, sueh as disk harrows and specially constructed rollers, may be used to consolidate the upper stirred portion of the soil and plaee it in elose capillary relationship with the lower unmoved layer. If the soil is allowed to become dry and pulverized, rain is likely to run off or "puddle" the surface without penetrating it more than a very short distance. Constant hoeing or harrowing to maintain a natural soil muleh layer of 2 or 3 in. deep greatly conserves the soil water below. In certain districts where the rainfall is low a crop can only be obtained once every alternate year, the intervening season being devoted to tillage with a view of getting the rain into the soil and retaining it there for the crop in the following year.

Bacteria in the Soil.—Recent science has made mueh progress in the investigation of the micro-organisms of the soil. Whereas the soil used to be looked upon solely as a dead, inert material containing certain ehemical substances which serve as food constituents of the crops grown upon it, it is now known to be a plaee of habitation for myriads of minute living organisms upon whose aetivity mueh of its fertility depends. They are responsible for many important ehemical processes whieh make the soil eonstituents more available and better adapted to the nutrition of crops. One cubie centimetre of soil taken within a foot or so from the surface contains from 1½ to 2 millions of baeteria of many different kinds, as well as large numbers of fungi. In the lower depths of the soil the numbers decrease, few being met with at a depth of 5 or 6 ft.

The efficiency of many substances, such as farm-yard manure, guanos, bone-meal and all other organic materials, whieh are spread over or dug or ploughed into the land for the benefit of farm and garden erops, is bound up with the action of these minute living beings. Without their aid most manures would be useless for plant growth. Farm-yard manure, guanos and other fertilizers undergo decomposition in the soil and become broken down into eompounds of simple ehemical eomposition better suited for absorption by the roots of crops, the ehanges involved being directly due to the aetivity of baeteria and fungi. Much of the work earried on by these organisms is not clearly understood; there are, however, certain processes which have been extensively investigated and to these it is necessary to refer.

It has been found by experiment that the nitrogen needed by practically all farm crops except leguminous ones is best supplied in the form of a nitrate; the rapid effect of nitrate of soda when used as a top dressing to wheat or other plants is well known to farmers. It has long been known that when organie materials such as the dung and urine of animals, or even the bodies of animals and plants, are applied to the soil, the nitrogen within them becomes oxidized, and ultimately appears in the form of nitrate of lime, potash or some other base. The nitrogen in decaying roots, in the dead stems and leaves of plants, and in humus generally is sooner or later changed into a nitrate, the ehange being effected by bacteria. That the action of living organisms is the cause of the production of nitrates is supported by the fact that the change does not occur when the soil is heated nor when it is treated with disinfectants which destroy or check the growth and life of bacteria. The process resulting in the formation of nitrates in the soil is spoken of as *nitrification*.

The steps in the breaking down of the highly complex nitrogenous proteid compounds contained in the humus of the soil, or applied to the latter by the farmer in the form of dung and organic refuse generally, are many and varied; most frequently the insoluble proteids are changed by various kinds of putrefactive bacteria into soluble proteids (peptones, &c.), these into simpler amido-bodies, and these again sooner or later into compounds of ammonia. The urea in urine is also rapidly converted by the uro-bacteria into ammonium carbonate. The compounds of ammonia thus formed from the complex substances by many varied kinds of micro-organisms are ultimately oxidized into nitrates. The change takes place in two stages and is effected by two special groups of nitrifying bacteria, which are present in all soils. In the first stage the ammonium compounds are oxidized to nitrites by the agency of very minute motile bacteria belonging to the genus *Nitrosomonas*. The further oxidation of the nitrite to a nitrate is effected by bacteria belonging to the genus *Nitrobacter*.

Several conditions must be fulfilled before nitrification can occur. In the first place an adequate temperature is essential; at 5° or 6° C. (41°–43° F.) the process is stopped, so that it does not go on in winter. In summer, when the temperature is about 24° C. (75° F.), nitrification proceeds at a rapid rate. The organisms do not carry on their work in soils deficient in air; hence the process is checked in water-logged soils. The presence of a base such as lime or magnesia (or their carbonates) is also essential, as well as an adequate degree of moisture: in dry soils nitrification ceases.

It is the business of the farmer and gardener to promote the activity of these organisms by good tillage, careful drainage and occasional application of lime to soils which are deficient in this substance. It is only when these conditions are attended to that decay and nitrification of dung, guano, fish-meal, sulphate of ammonia and other manures take place, and the constituents which they contain become available to the crops for whose benefit they have been applied to the land.

Nitrates are very soluble in water and are therefore liable to be washed out of the soil by heavy rain. They are, however, very readily absorbed by growing plants, so that in summer, when nitrification is most active, the nitrates produced are usually made use of by crops before loss by drainage takes place. In winter, however, and in fallows loss takes place in the subsoil water.

There is also another possible source of loss of nitrates through the activity of denitrifying bacteria. These organisms reduce nitrates to nitrites and finally to ammonia and gaseous free nitrogen which escapes into the atmosphere. Many bacteria are known which are capable of denitrification, some of them being abundant in fresh dung and upon old straw. They can, however, only carry on their work extensively under anaerobic conditions, as in water-logged soils or in those which are badly tilled, so that there is but little loss of nitrates through their agency.

An important group of soil organisms are now known which have the power of using the free nitrogen of the atmosphere for the formation of the complex nitrogenous compounds of which their bodies are largely composed. By their continued action the soil becomes enriched with nitrogenous material which eventually through the nitrification process becomes available to ordinary green crops. This power of "fixing nitrogen," as it is termed, is apparently not possessed by higher green plants. The bacterium, *Clostridium pasteurianum*, common in most soils, is able to utilize free nitrogen under anaerobic conditions, and an organism known as *Azotobacter chroococcum* and some others closely allied to it, have similar powers which they can exercise under aerobic conditions. For the carrying on of their functions they all need to be supplied with carbohydrates or other carbon compounds which they obtain ordinarily from humus and plant residues in the soil, or possibly in some instances from carbohydrates manufactured by minute green algae with which they live in close union. Certain bacteria of the nitrogen-fixing class enter into association with the roots of green plants, the best-known examples being those which are met with in the nodules upon the roots of clover, peas, beans, sainfoin and other plants belonging to the leguminous order.

That the fertility of land used for the growth of wheat is improved by growing upon it a crop of beans or clover has been long recognized by farmers. The knowledge of the cause, however, is due to modern investigations. When wheat, barley, turnips and similar plants are grown, the soil upon which they are cultivated becomes depleted of its nitrogen; yet after a crop of clover or other leguminous plants the soil is found to be richer in nitrogen than it was before the crop was grown. This is due to the nitrogenous root residues left in the land. Upon the roots of leguminous plants characteristic swollen nodules or tubercles are present. These are found to contain large numbers of a bacterium termed *Bacillus radicicola* or *Pseudomonas radicicola*. The bacteria, which are present in almost all soils, enter the root-hairs of their host plants and ultimately stimulate the production of an excrescent nodule, in which they live. For a time after entry they multiply, obtaining the nitrogen necessary for their nutrition and growth from the free nitrogen of the air, the carbohydrate required being supplied by the pea or clover plant in whose tissues they make a home. The nodules increase in size, and analysis shows that they are exceedingly rich in nitrogen up to the time of flowering of the host plant. During this period the bacteria multiply and most of them assume a peculiar thickened or branched form, in which state they are spoken of as bacteroids. Later the nitrogen-content of the nodule decreases, most of the organisms, which are largely composed of proteid material, becoming digested and transformed into soluble nitrogenous compounds which are conducted to the developing roots and seeds. After the decay of the roots some of the unchanged bacteria are left in the soil, where they remain ready to infect a new leguminous crop.

The nitrogen-fixing nodule bacteria can be cultivated on artificial media, and many attempts have been made to utilize them for practical purposes. Pure cultures may be made and after dilution in water or other liquid can be mixed with soil to be ultimately spread over the land which is to be infected. The method of using them most frequently adopted consists in applying them to the seeds of leguminous plants before sowing, the seed being dipped for a time in a liquid containing the bacteria. In this manner organisms obtained from red clover can be grown and applied to the seed of red clover; and similar inoculation can be arranged for other species, so that an application of the bacteria most suited to the particular crop to be cultivated can be assured. In many cases it has been found that inoculation, whether of the soil or of the seed, has not made any appreciable difference to the growth of the crop, a result no doubt due to the fact that the soil had already contained within it an abundant supply of suitable organisms. But in other instances greatly increased yields have been obtained where inoculation has been practised. More or less pure cultures of the nitrogen-fixing bacteria belonging to the *Azotobacter* group have been tried and recommended for application to poor land in order to provide a cheap supply of nitrogen. The application of pure cultures of bacteria for improving the fertility of the land is still in an experimental stage. There is little doubt, however, that in the near future means will be devised to obtain the most efficient work from these minute organisms, either by special artificial cultivation and subsequent application to the soil, or by improved methods of encouraging their healthy growth and activity in the land where they already exist.

Improvement of Soils.—The fertility of a soil is dependent upon a number of factors, some of which, such as the addition of fertilizers or manures, increase the stock of available food materials in the soil (see MANURE), while others, such as application of clay or humus, chiefly influence the fertility of the land by improving its physical texture.

The chief processes for the improvement of soils which may be discussed here are: liming, claying and marling, warping, paring and burning, and green manuring. Most of these more or less directly improve the land by adding to it certain plant food constituents which are lacking, but the effect of each process is in reality very complex. In the majority of cases the good results obtained are more particularly due to the setting free of "dormant" or "latent" food constituents and to the amelioration of the texture of the soil, so that its aeration, drainage, temperature and water-holding capacity are altered for the better.

Liming.

The material which chemists call calcium carbonate is met with in a comparatively pure state in chalk. It is present in variable amounts in limestones of all kinds, although its whiteness may there be masked by the presence of iron oxide and other coloured substances. Carbonate of lime is also a constituent to a greater or lesser extent in almost all soils. In certain sandy soils and in a few stiff clays it may amount to less than ¼%, while in others in limestone and chalk districts there may be 50 to 80% present. Pure carbonate of lime when heated loses 44% of its weight, the decrease being due to the loss of carbon dioxide gas. The resulting white product is termed calcium oxide lime, burnt lime, quicklime, cob lime, or caustic lime. This substance absorbs and combines with water very greedily, at the same time becoming very hot, and falling into a fine dry powder, calcium hydroxide or slaked lime, which when left in the open slowly combines with the carbon dioxide of the air and becomes calcium carbonate, from which we began.

When recommendations are made about liming land it is necessary to indicate more precisely than is usually done which of the three classes of material named above—chalk, quicklime or slaked lime—is intended. Generally speaking the oxide or quicklime has a more rapid and greater effect in modifying the soil than slaked lime, and this again greater than the carbonate or chalk.

Lime in whatever form it is applied has a many-sided influence in the fertility of the land. It tends to improve the tilth and the capillarity of the soil by binding sands together somewhat and by opening up clays. If applied in too great an amount to light soils and peat land it may do much damage by rendering them too loose and open. The addition of small quantities of lime, especially in a caustic form, to stiff greasy clays makes them much more porous and pliable. A lump of clay, which if dried would become hard and intractable, crumbles into pieces when dried after adding to it ½% of lime. The lime causes the minute separate particles of clay to flocculate or group themselves together into larger compound grains between which air and water can percolate more freely. It is this power of creating a more crumbly tilth on stiff clays that makes lime so valuable to the farmer. Lime also assists in the decomposition of the organic matter or humus in the soil and promotes nitrification; hence it is of great value after green manuring or where the land contains much humus from the addition of bulky manures such as farm-yard dung. This tendency to destroy organic matter makes the repeated application of lime a pernicious practice, especially on land which contains little humus to begin with. The more or less dormant nitrogen and other constituents of the humus are made immediately available to the succeeding crop, but the capital of the soil is rapidly reduced, and unless the loss is replaced by the addition of more manures the land may become sterile. Although good crops may follow the application of lime, the latter is not a direct fertilizer or manure and is no substitute for such. Its best use is obtained on land in good condition, but not where the soil is poor. When used on light dry land it tends to make the land drier, since it destroys the humus which so largely assists in keeping water in the soil. Lime is a base and neutralizes the acid materials present in badly drained meadows and boggy pastures. Weeds, therefore, which need sour conditions for development are checked by liming and the better grasses and clovers are encouraged. It also sets free potash and possibly other useful plant food-constituents of the soil. Liming tends to produce earlier crops and destroys the fungus which causes finger-and-toe or club-root among turnips and cabbages.

Land which contains less than about ½% of lime usually needs the addition of this material. The particular form in which lime should be applied for the best results depends upon the nature of the soil. In practice the proximity to chalk pits or lime kilns, the cost of the lime and cartage, will determine which is most economical. Generally speaking light poor lands deficient in organic matter will need the less caustic form or chalk, while quicklime will be most satisfactory on the stiff clays and richer soils. On the stiff soils overlying the chalk it was formerly the custom to dig pits through the soil to the rock below. Shafts 20 or 30 ft. deep were then sunk, and the chalk taken from horizontal tunnels was brought to the surface and spread on the land at the rate of about 60 loads per acre. Chalk should be applied in autumn, so that it may be split by the action of frost during the winter. Quicklime is best applied, perhaps, in spring at the rate of one ton per acre every six or eight years, or in larger doses—4 to 8 tons—every 15 to 20 years. Small dressings applied at short intervals give the most satisfactory results. The quicklime should be placed in small heaps and covered with soil if possible until it is slacked and the lumps have fallen into powder, after which it may be spread and harrowed in. Experiments have shown that excellent effects can be obtained by applying 5 or 6 cwt. of ground quicklime.

Gas-lime is a product obtained from gasworks where quicklime is used to purify the gas from sulphur compounds and other objectionable materials. It contains a certain amount of unaltered caustic lime and slacked lime, along with sulphates and sulphides of lime, some of which have an evil odour. As some of these sulphur compounds have a poisonous effect on plants, gas-lime cannot be applied to land directly without great risk or rendering it incapable of growing crops of any sort—even weeds—for some time. It should therefore be kept a year or more in heaps in some waste corner and turned over once or twice so that the air can gain access to it and oxidize the poisonous ingredients in it.

Many soils of a light sandy or gravelly or peaty nature and liable to drought and looseness of texture can be improved by the addition of large amounts of clay of an ordinary character. Similarly soils can be improved by applying to them marl, a substance consisting of a mixture of clay with variable proportions of lime. Some of the chalk marls, which are usually of a yellowish or dirty grey colour, contain clay and 50 to 80% of carbonate of lime with a certain proportion of phosphate of lime. Such a material would not only have an influence on the texture of the land but the lime would reduce the sourness of the land and the phosphate of lime supply one of the most valuable of plant food-constituents. The beneficial effects of marls may also be partially due to the presence in them of available potash.

Claying and Marling.

Typical clay-marls are tenacious, soapy clays of yellowish-red or brownish colour and generally contain less than 50% of lime. When dry they crumble into small pieces which can be readily mixed with the soil by ploughing. Many other kinds of marls are described; some are of a sandy nature, others stony or full of the remains of small shells. The amount and nature of the clay or marl to be added to the soil will depend largely upon the original composition of the latter, the lighter sands and gravel requiring more clay than those of firmer texture. Even stiff soils deficient in lime are greatly improved in fertility by the addition of marls. In some cases as little as 40 loads per acre have been used with benefit, in others 180 loads have not been too much. The material is dug from neighbouring pits or sometimes from the fields which are to be improved, and applied in autumn and winter. When dry and in a crumbly state it is harrowed and spread and finally ploughed in and mixed with the soil.

On some of the strongest land it was formerly the practice to add to and plough into it burnt clay, with the object of making the land work more easily. The burnt clay moreover carried with it potash and other materials in a state readily available to the crops. The clay is dug from the land or from ditches or pits and placed in heaps of 60 to 100 loads each, with faggot wood, refuse coals or other fuel. Great care is necessary to prevent the heaps from becoming too hot, in which case the clay becomes baked into hard lumps of brick-like material which cannot be broken up. With careful management, however, the clay dries and bakes, becoming slowly converted into lumps which readily crumble into a fine powder, in which state it is spread over and worked into the land at the rate of 40 loads per acre.

Clay Burning.

The paring and burning of land, although formerly practised as an ordinary means of improving the texture and fertility of arable fields, can now only be looked upon as a practice to be adopted for the purpose of bringing rapidly into cultivation very foul leys or land covered with a coarse turf. The practice is confined to poorer types of land, such as heaths covered with furze and bracken or fens and clay areas smothered with rank grasses and sedges. To reduce such land to a fit state for the growth of arable crops is very difficult and slow without resort to paring and burning. The operation consists of paring off the tough sward to a depth of 1 to 2 in. just sufficient to effectually damage the roots of the plants forming the sward and then, after drying the sods and burning them, spreading the charred material and ashes over the land. The turf is taken off either with the breast plough—a paring tool pushed forward from the breast or thighs by the workman—or with specially constructed paring ploughs or shims. The depth of the sod removed should not be too thick or burning is difficult and too much humus is destroyed unnecessarily, nor should it be too thin or the roots of the herbage are not effectually destroyed.

Paring and Burning.

The operation is best carried out in spring and summer. After being pared off the turf is allowed to dry for a fortnight or so and is then placed in small heaps a yard or two wide at the base, a little straw or wood being put in the middle of each heap, which is then lighted. As burning proceeds more turf is added to the outside of the heaps in such a manner as to allow little access of air. Every care should be taken to burn and char the sod thoroughly without permitting the heap to blaze. The ashes should be spread as soon as possible and covered by a shallow ploughing. The land is then usually sown with some rapidly growing green crop, such as rape, or with turnips.

Paring and burning improves the texture of clay lands, particularly if draining is carried out at the same time. It tends to destroy insects and weeds, and gets rid of acidity of the soil. No operation brings old turf into cultivation so rapidly. Moreover the beneficial effects are seen in the first crop and last for many years. Many of the mineral plant food-constituents locked up in the coarse herbage and in the upper layers of the soil are made immediately available to crops. The chief disadvantage is the loss of nitrogen which it entails, this element being given off into the air in a free gaseous state. It is best adapted for application to clays and fen lands and should not be practised on shallow light sands or gravelly soils, since the humus so necessary for the fertility of such areas is reduced too much and the soil rendered too porous and liable to suffer from drought.

Many thousands of acres of low-lying peaty and sandy land adjoining the tidal rivers which flow into the Humber have been improved by a process termed "warping." The warp consists of fine muddy sediment which is suspended in the tidal-river water and appears to be derived from material scoured from the bed of the Humber by the action of the tide and a certain amount of sediment brought down by the tributary streams which join the Humber some distance from its mouth. The field or area to be warped must lie below the level of the water in the river at high tide. It is first surrounded by an embankment, after which the water from the river is allowed to flow through a properly constructed sluice in its bank, along a drain or ditch to the land which is prepared for warping. By a system of carefully laid channels the water flows gently over the land, and deposits its warp with an even level surface. At the ebb of the tide the more or less clear water flows back again from the land into the main river with sufficient force to clean out any deposit which may have accumulated in the drain leading to the warped area, thus allowing free access of more warp-laden water at the next tide. In this manner poor peats and sands may be covered with a large layer of rock soil capable of growing excellent crops.

Warping.

The amount of deposit laid over the land reaches a thickness of two or three feet in one season of warping, which is usually practised between March and October, advantage being taken of the spring tides during these months. The new warp is allowed to lie fallow during the winter after being laid out in four-yard "lands" and becomes dry enough to be sown with oats and grass and clover seeds in the following spring. The clover-grass ley is then grazed for a year or two with sheep, after which wheat and potatoes are the chief crops grown on the land.

Green Manuring. Green manures are crops which are grown especially for the purpose of ploughing into the land in a green or actively growing state. The crop during its growth obtains a considerable amount of carbon from the carbon dioxide of the air, and builds it up into compounds which when ploughed into the land become humus. The carbon compounds of the latter are of no direct nutritive value to the succeeding crop, but the decaying vegetable tissues very greatly assist in retaining moisture in light sandy soils, and in clay soils also have a beneficial effect in rendering them more open and allowing of better drainage of superfluous water and good circulation of fresh air within them. The ploughing-in of green crops is in many respects like the addition of farm-yard manure. Their growth makes no new addition of mineral food-constituents to the land, but they bring useful substances from the subsoil nearer to the surface, and after the decay of the buried vegetation these become available to succeeding crops of wheat or other plants. Moreover, where deep-rooting plants are grown the subsoil is aerated and rendered more open and suitable for the development of future crops.

The plants most frequently used are white mustard, rape, buckwheat, spurry, rye, and several kinds of leguminous plants, especially vetches, lupins and serradella. By far the most satisfactory crops as green manures are those of the leguminous class, since they add to the land considerable amounts of the valuable fertilizing constituent, nitrogen, which is obtained from the atmosphere. By nitrification this substance rapidly becomes available to succeeding crops. On the light, poor sands of Saxony Herr Schultz, of Lupitz, made use of serradella, yellow lupins and vetches as green manures for enriching the land in humus and nitrogen, and found the addition of potash salts and phosphates very profitable for the subsequent growth of potatoes and wheat. He estimated that by using leguminous crops in this manner for the purpose of obtaining cheap nitrogen he reduced the cost of production of wheat more than 50%.

The growing crops should be ploughed in before flowering occurs; they should not be buried deeply, since decay and nitrification take place most rapidly and satisfactorily when there is free access of air to the decaying material. When the crop is luxuriant it is necessary to put a roller over it first, to facilitate proper burial by the plough. The best time for the operation appears to be late summer and autumn. (J. Pe.)

Soil and Disease.—The influence of different kinds of soil as a factor in the production of disease requires to be considered, in regard not only to the nature and number of the micro-organisms they contain, but also to the amount of moisture and air in them and their capacity for heat. The moisture in soil is derived from two sources—the rain and the ground-water. Above the level of the ground-water the soil is kept moist by capillary attraction and by evaporation of the water below, by rainfall, and by movements of the ground-water; on the other hand, the upper layers are constantly losing moisture by evaporation from the surface and through vegetation. When the ground-water rises it forces air out of the soil; when it falls again it leaves the soil moist and full of air. The nature of the soil will largely influence the amount of moisture which it will take up or retain. In regard to water, all soils have two actions —namely, permeability and absorbability. Permeability is practically identical with the speed at which percolation takes place; through clay it is slow, but increases in rapidity through marls, loams, limestones, chalks, coarse gravels and fine sands, reaching a maximum in soil saturated with moisture. The amount of moisture retained depends mainly upon the absorbability of the soil, and as it depends largely on capillary action it varies with the coarseness or fineness of the pores of the soil, being greater for soils which consist of fine particles. The results of many analyses show that the capacity of soils for moisture increases with the amount of organic substances present; decomposition appears to be most active when the moisture is about 4%, but can continue when it is as low as 2%, while it appears to be retarded by any excess over 4%. Above the level of the ground-water all soils contain air, varying in amount with the degree of looseness of the soil. Some sands contain as much as 50% of air of nearly the same composition as atmospheric air. The oxygen, however, decreases with the depth, while the carbon dioxide increases.

Among the most noteworthy workers at the problems involved in the question of the influence of soil in the production of disease we find von Foder, Pettenkofer, Levy, Fleck, von Naegeli, Schleesing, Muntz and Warrington. The study of epidemic and endemic diseases generally has brought to light an array of facts which very strongly suggest that an intimate association exists between the soil and the appearance and propagation of certain diseases; but although experiments and observations allow this view to be looked upon as well established, still the precise rôle played by the soil in an aetiological respect is by no means so well understood as to make it possible to separate the factors and dogmatize on their effects. The earliest writers upon cholera emphasized its remarkable preference for particular places; and the history of each successive epidemic implies, besides an importation of the contagion, certain local conditions which may be either general sanitary defects or peculiarities of climate and soil. The general evidence indicates that the specific bacteria of cholera discharges are capable of a much longer existence in the superficial soil layers than was formerly supposed; consequently it is specially necessary to guard against pollution of the soil, and through it against the probable contamination of both water and air. The evidence, however, is not sufficiently strong to warrant a universal conclusion, the diffusion of cholera appearing to be largely dependent upon other factors than soil states. Again, all accounts of diphtheria show a tendency on the part of the disease to recur in the same districts year after year. The questions naturally suggest themselves—Are the reappearances due to a revival of the contagion derived from previous outbreaks in the same place, or to some favouring condition which the place offers for the development of infection derived from some other quarter; and have favouring conditions any dependence upon the character and state of the soil? Greenhow in 1858 stated that diphtheria was especially prevalent on cold, wet soils, and Airy in 1881 described the localities affected as "for the most part cold, wet, clay lands." An analysis of the innumerable outbreaks in various parts of Europe indicates that the geological features of the affected districts play a less important part in the incidence of the disease than soil dampness. In this connexion it is interesting to note the behaviour of the diphtheritic contagion in soil. Experiments show that pure cultures, when mixed with garden soil constantly moistened short of saturation and kept in the dark at a temperature of 14° C., will retain their vitality for more than ten months; from moist soil kept at 26° C. they die out in about two months; from moist soil at 30° C. in seventeen days; and in dry soil at the same temperature within a week. In the laboratory absolute soil dryness is as distinctly antagonistic to the vitality of the diphtheria bacillus as soil dampness is favourable. Both statistically and experimentally we find that a damp soil favours its life and development, while prolonged submersion and drought kill it. We may consider that, in country districts, constant soil moisture is one of the chief factors; while in the case of urban outbreaks mere soil moisture is subsidiary to other more potent causes.

Again, many facts in the occurrence and diffusion of enteric fever point to an intimate connexion between its origin and certain conditions of locality. Epidemics rarely spread over any considerable tract of country, but are nearly always confined within local limits. Observations made at the most diverse parts of the globe, and the general distribution area of the disease, show that mere questions of elevation, or even configuration of the ground, have little or no influence. On the other hand, the same observations go to show that the disease is met with oftener on the more recent formations than the older, and this fact, so far as concerns the physical characters of the soil, is identical with the questions of permeability to air and water. Robertson has shown that the typhoid bacillus can grow very easily in certain soils, can persist in soils through the winter months, and when the soil is artificially fed, as may be done by a leaky drain or by access of filthy water from the surface, the micro-organism will take on a fresh growth in the warm season. The destructive power of sunlight is only exercised on those organisms actually at the surface. Cultures of the typhoid organism planted at a depth of 18 in. were found to have grown to the surface. In the winter months the deeper layers of the soil act as a shelter to the organism, which again grows towards the surface during the summer. The typhoid organism was not found to be taken off from the decomposing masses of semi-liquid filth largely contaminated with a culture of *bacillus typhosus*; but, on the other hand, it was abundantly proved that it could grow over moist surfaces of stones, &c. Certain disease-producing organisms, such as the bacillus of tetanus and malignant oedema, appear to be universally distributed in soil, while others, as the *bacillus typhosus* and *spirillum cholerae*, appear to have only a local distribution. The conditions which favour the vitality, growth and multiplication of the typhoid bacillus are the following: the soil should be pervious; it should be permeated with a sufficiency of decaying—preferably animal—organic matters; it should possess a certain amount of moisture, and be subject to a certain temperature. Depriving the organism of any of these essential conditions for its existence in the soil will secure our best weapon for defence. The optimum temperature adapted to its growth and extension is 37° C. = 98°·4 F. Sir Charles Cameron attributes the prevalence of typhoid in certain areas in

Dublin to the soil becoming saturated with faecal matter and specifically infected. The ratio of cases to population living in Dublin on loose porous gravel soil for the ten years 1881–1891 was 1 in 94, while that of those living on stiff clay soil was but 1 in 145. "This is as we should expect, since the movements of ground air are much greater in loose porous soils than in stiff clay soils." A foul gravel soil is a most dangerous one on which to build. For warmth, for dryness, for absence of fog, and for facility of walking after rain, just when the air is at its purest and its best, there is nothing equal to gravel; but when gravel has been rendered foul by infiltration with organic matters it may easily become a very hotbed of disease. (J. L. N.)

SOISSONS, a city of northern France, in the department of Aisne, 65 m. N.E. of Paris by the railway to Laon. Pop. (1906), 11,586. Soissons, pleasantly situated amongst wooded hills, stands on the left bank of the Aisne, the suburbs of St Vaast and St Médard lying on the right bank. The cathedral of Notre-Dame was begun in the second half of the 12th century and finished about the end of the 13th. It is 328 ft. long and 87 wide, and the vaulting of the nave is 100 ft. above the pavement. The single tower dates from the middle of the 13th century and is an imitation of those of Notre-Dame of Paris, which it equals in height (216 ft.). The south transept, the oldest and most graceful portion of the whole edifice, terminates in an apse. The façade of the north transept dates from the end of the 13th century. The apse and choir retain some fine 13th-century glass. Considerable remains exist of the magnificent abbey of St Jean-des-Vignes, where Thomas Becket resided for a short time. These include the ruins of two cloisters (the larger dating from the 13th century), the refectory, and above all the imposing façade of the church (restored). Above the three portals (13th century) runs a gallery, over which again is a large window; the two unequal towers (230 and 246 ft.) of the 15th and early 16th centuries are surmounted by beautiful stone spires, which command the town. The church of St Léger, which belongs to the 13th century, was formerly attached to an abbey of the Génovéfains. Beneath are two Romanesque crypts. The royal abbey of Notre-Dame, now a barrack, was founded in 660 for monks and nuns by Leutrade, wife of Ebroïn, the celebrated mayor of the palace. The number of the nuns (216 in 858), the wealth of the library in manuscripts, the valuable relics, the high birth of the abbesses, the popularity of the pilgrimages, all contributed to the importance of this abbey, of which there exist only inconsiderable remains. The wealthiest of all the abbeys in Soissons, and one of the most important of all France during the first two dynasties, was that of St Médard, on the right bank of the Aisne, founded about 560 by Clotaire I., beside the villa of Syagrius, which had become the palace of the Frankish kings. St Médard, apostle of Vermandois, and kings Clotaire and Sigebert, were buried in the monastery, which became the residence of 400 monks and the meeting-place of several councils. It was there that Childeric III., the last Merovingian, was deposed and Pippin the Short was crowned by the papal legate, and there Louis the Pious was kept in captivity in 833. The abbots of St Médard coined money, and in Abelard's time (12th century) were lords of 220 villages, farms and manors. At the battle of Bouvines (1214) the abbot commanded 150 vassals. In 1530 St Médard was visited by a procession of 300,000 pilgrims. But the religious wars ruined the abbey, and, although it was restored by the Benedictines in 1637, it never recovered its former splendour. Of the churches and the conventual buildings of the ancient foundation there hardly remains a trace. The site is occupied by a deaf and dumb institution, the chapel of which stands over the crypt of the great abbey church, which dates from about 840. In the crypt is a stone coffin, said to have been that of Childebert II., and close at hand is an underground chamber, reputed to have been the place of captivity of Louis the Pious.

The civil buildings of the town are not of much interest. The hôtel-de-ville contains a library and a museum with collections of paintings and antiquities. The foundation of the hôtel-dieu dates back to the 13th century. The town has a large botanical garden. Soissons is the seat of a bishop and a sub-prefect, and has tribunals of first instance and of commerce, a communal college and higher ecclesiastical seminary. Among the industrial establishments are iron and copper foundries, and factories for the production of boilers, agricultural implements and other iron goods, straw hats, glass and sugar. Grain, haricot beans of exceptional quality, and timber are the principal articles of trade.

Soissons is generally identified with the oppidum of Gallia Belgica, called *Noviodunum* by Caesar. Noviodunum was the capital of the Suessiones, who occupied twelve towns, and whose king, Divitiacus, one of the most powerful in Gaul, had extended his authority even beyond the sea among the Britons. In 58 B.C. Galba, king of the Suessiones, separated from the confederation of the Belgians and submitted to the Romans. At the beginning of the empire Noviodunum took the name of *Augusta Suessionum*, and afterwards that of *Suessiona*, and became the second capital of Gallia Belgica, of which Reims was the metropolis. The town was before long surrounded with a regular wall and defended by a citadel, and it became the starting-point of several military roads (to Reims, Château-Thierry, Meaux, Paris, Amiens and St Quentin). Christianity was introduced by St Crispin and St Crispinian, men of noble birth, who, however, earned their livelihood by shoemaking, and thus became patrons of that craft. After their martyrdom in 297 their work was continued by St Sinitius, the first bishop of Soissons. After the barbarians had crossed the Rhine and the Meuse Soissons became the metropolis of the Roman possessions in the north of Gaul, and on the defeat of Syagrius by Clovis the Franks seized the town. It was at Soissons that Clovis married Clotilde, and, though he afterwards settled at Paris, Soissons was the capital of his son Clotaire, and afterwards of Chilperic I., king of Neustria. It was not till the time of Chilperic's son, Clotaire II., that the kingdom of Soissons was incorporated with that of Paris. Pippin the Short was at Soissons proclaimed king by an assembly of *leudes* and bishops, and he was there crowned by the papal legate, St Boniface, before being crowned at Saint Denis by the pope himself. Louis the Pious did penance there after being deposed by the assembly at Compiègne. Under Charles the Fat (886) the Normans failed in an attempt against the town, but laid waste St Médard and the neighbourhood. In 923 Charles the Simple was defeated outside the walls by the supporters of Rudolph of Burgundy, and Hugh the Great besieged and partly burned the town in 948. Under the first Capets Soissons was held by hereditary counts (see below), frequently at war with the king or the citizens. The communal charter of the town dates from 1131. At a synod held at Soissons in 1121 the teachings of Abélard were condemned, and he was forced to retract them. In 1155, at an assembly of prelates and barons held at Soissons, Louis VII. issued a famous decree forbidding all private wars for a space of ten years; and in 1325 Charles the Fair replaced the mayor of Soissons by a royal provost dependent on the bailiwick of Vermandois, the inhabitants retaining only the right of electing four *échevins*. The town had to suffer severely during the war of the Hundred Years; in 1414, when it was held by the Burgundians, it was captured and sacked by the Armagnacs under the dauphin; and this same fate again befell it several times within twenty years. The Treaty of Arras (1435) brought it again under the royal authority. It was sacked by Charles V. in 1544 and in 1565 by the Huguenots, who laid the churches in ruins, and, supported by the prince of Condé, count of Soissons, kept possession of the town for six months. During the League Soissons eagerly joined the Catholic party. Charles, duke of Mayenne, made the town his principal residence, and died there in 1611. A European congress was held there in 1728. In 1814 Soissons was captured and recaptured by the allies and the French. In 1815, after Waterloo, it was a rallying point for the vanquished, and it was not occupied by the Russians till the 14th of August. In 1870 it capitulated to the Germans after a bombardment of three days.

Counts of Soissons.—In the middle ages Soissons was the chief town of a countship belonging in the 10th and 11th centuries to a family which apparently sprang from the counts of Vermandois. Renaud, count of Soissons, gave his property in 1141 to his nephew Yves de Nesle. By successive marriages the countship of Soissons passed to the houses of Hainaut, Châtillon-Blois, Coucy, Bar and Luxemburg. Marie de Luxemburg brought it, together with the counties of Marle and St Pol, to Francis of Bourbon, count of Vendôme, whom she married in 1487. His descendants, the princes of Condé, held Soissons and gave it to their cadets. Charles of Bourbon, count of Soissons (1566–1612), son of Louis, prince of Condé, whose political vacillations were due to his intrigues with Henry IV.'s sister Catherine, became grand master of France and governor of Dauphiné and Normandy. His son, Louis of Bourbon (1604–1641), took part in the plots against Marie de Medici and Richelieu, and attempted to assassinate Richelieu. He had only one child, a natural son, known as the Chevalier de Soissons. The countship passed to the house of Savoy-Carignan by the marriage in 1625 of Marie de Bourbon-Soissons with Thomas Francis of Savoy. Eugène Maurice of Savoy, count of Soissons (1635–1673), married the beautiful and witty Olympia Mancini, a niece of Cardinal Mazarin, and obtained high military posts through his wife's influence. He defeated the Spaniards at the battle of the Dunes in 1658; took part in the campaigns at Flanders (1667), Franche-Comté (1668) and Holland (1672); and was present as ambassador extraordinary of France at the coronation of Charles II. of England. His wife led a scandalous life, and was accused of poisoning her husband and others. She was the mother of Louis Thomas Amadeus, count of Soissons, and of the famous Prince Eugène of Savoy. In 1734 the male line of the family of Savoy-Soissons became extinct, and the heiress, the princess of Saxe-Hildburghausen, ceded the countship of Soissons to the house of Orleans, in whose possession it remained until 1789.

SOKE (O. Eng. *soc*, connected ultimately with *secan*, to seek), a word which at the time of the Norman Conquest generally denoted jurisdiction, but was often used vaguely and is probably incapable of precise definition. In some cases it denoted the right to hold a court, and in others only the right to receive the fines and forfeitures of the men over whom it was granted when they had been condemned in a court of competent jurisdiction. Its primary meaning seems to have been "seeking"; thus "soka faldae" was the duty of seeking the lords court, just as "secta ad molendinum" was the duty of seeking the lords mill. The "Leges Henrici" also speaks of pleas "in socna, id est, in quaestione sua"—pleas which are in his investigation. It is evident, however, that not long after the Norman Conquest considerable doubt prevailed about the correct meaning of the word. In some versions of the much used tract *Interpretationes uocabulorum* soke is defined "aver fraunc court," and in others as "interpellacio maioris audientiae," which is glossed somewhat ambiguously as "claim a justis et requeste." Soke is also frequently associated to "sak" or "sake" in the alliterative jingle "sake and soke," but the two words are not etymologically related. "Sake" is the Anglo-Saxon "sacu," originally meaning a matter or cause (from *sacan*, to contend), and later the right to have a court. Soke, however, is the commoner word, and appears to have had a wider range of meaning. The term "soke," unlike "sake," was sometimes used of the district over which the right of jurisdiction extended.

Mr Adolphus Ballard has recently argued that the interpretation of the word "soke" as jurisdiction should only be accepted where it stands for the fuller phrase, "sake and soke," and that soke standing by itself denoted services only. There are certainly many passages in Domesday Book which support his contention, but there are also other passages in which soke seems to be merely a short expression for "sake and soke." The difficulties about the correct interpretation of these words will probably not be solved until the normal functions and jurisdiction of the various local courts have been more fully elucidated.

"The sokemen" were a class of tenants, found chiefly in the eastern counties, occupying an intermediate position between the free tenants and the bond tenants or villains. As a general rule they were personally free, but performed many of the agricultural services of the villains. It is generally supposed they were called sokemen because they were within the lord's soke or jurisdiction. Mr Ballard, however, holds that a sokeman was merely a man who rendered services, and that a sokeland was land from which services were rendered, and was not necessarily under the jurisdiction of a manor. The law term, socage, used of this tenure, is a barbarism, and is formed by adding the French *age* to *soc*.

Tait, review of the last-mentioned book in *English Historical Review* for January 1908; *Red Book of the Exchequer* (Rolls Series), iii. 1035. (G. J. T.)

SOKOTO, an important Fula state of west central Sudan, now a province of the British protectorate of Nigeria. The sultan of Sokoto throughout the 19th century exercised an overlordship over the Hausa states extending east from the Niger to Bornu and southward to the Benue and Adamawa. These states and Sokoto itself, known variously as the Sokoto or Fula empire and Hausaland, came (*c.* 1900–1903) under direct British control, but the native governments are maintained. The province of Sokoto occupies the north-west corner of the British protectorate, and is bounded west and north by French territory. South and east it adjoins other parts of the British protectorate. Bordering north on the Sahara, it contains much arid land, but south-west the land is very fertile. Running through it in a south-westerly direction is the Gublin Kebbi or Sokoto river, which joins the Niger in 11½° N. 4° E. On a tributary of this river is the town of Sokoto.

The Sokoto or Fula empire was founded at the beginning of the 19th century. The country over which the Fula ruled has, however, a history going back to the middle ages. Between the Niger and the kingdom of Bornu (*q.v.*) the country was inhabited by various black tribes, of whom the Hausa occupied the plains. Under the influence of Berber and Arab tribes, who embraced Mahommedanism, the Hausa advanced in civilization, founded large cities, and developed a considerable trade, not only with the neighbouring countries, but, via the Sahara, with the Barbary states. The various kingdoms which grew up round each large town had their own rulers, but in the first half of the 16th century they all appear to have owned the sway of the Songhoi kings (see TIMBUKTU). On the break up of the Songhoi empire the north-eastern part of Hausaland became more or less subject to Bornu, whose sultans in the 17th century claimed to rule over Katsena and Kano. In this century arose a dynasty of the Habé, a name now believed to be identical with Hausa, who obtained power over a large area of the northern portion of the present British protectorate. The Hausa, whose conversion to Mahommedanism began in the 12th century, were still in the 18th century partly pagans, though their rulers were followers of the Prophet. These rulers built up an elaborate system of government which left a considerable share in the management of affairs to the body of the people. Dwelling among the Hausa were a number of Fula, mostly herdsmen, and these were devout Mahommedans. One of the more cultivated teachers of this race, named Othman Dan Fodio, had been tutor to the king of Gobir (a district north of Sokoto). He incurred the wrath of that king, who, angered at some act of defiance, ordered the massacre of every Fula in his dominions. The Fula flocked to Fodio's aid, and in the battle of Koto or Rugga Fakko (1804) the king of Gobir was utterly defeated. Thereupon Fodio unfurled the green banner of Mahomet and preached a *jihad* or religious war. In a few years the Fula had subdued most of the Hausa states, some, like Kano, yielding easily in order to preserve their trade, others, like Katsena, offering a stubborn resistance. Gobir and Kebbi remained unconquered, as did the pagan hill tribes. The Fula were also defeated in their attack on Bornu. In most places they continued the system of government which had grown up under the Habé, the chiefs or emirs of the various

Establishment of Fula Rule.

states being, however, tributary to Dan Fodio. This sheik established himself at Sokoto, and with other titles assumed that of Sarikin Muslimin (king of the Mahommedans). As such he became the recognized spiritual head of all the Mahommedans of west central Sudan, a headship which his successors retained unimpaired, even after the loss of their temporal position to the British in 1903. On the death of Fodio (*c.* 1819) the empire was divided between a son and a brother, the son, famous under the name of Sultan Bello, ruling at Sokoto, the brother at Gando. All the other Fula emirs were dependent on these two sultanates. The Fula power proved, before many years had gone by, in many respects harmful to the country. This was especially the case in those districts where there was a large pagan population. Slave-raiding was practised on a scale which devastated and almost depopulated vast regions and greatly hampered the commercial activity of the large cities, of which Zaria and Kano were the most important. The purity of the ancient administration was abandoned. The courts of justice became corrupt, administrative power was abused and degenerated into a despotism controlled only by personal considerations, oppressive taxes destroyed industry and gradually desolated the country. Soon after the Fula had established themselves Europeans began to visit the country. Hugh Clapperton, an Englishman, was at Sokoto in 1823 and again in 1827, dying there on the 13th of April of that year. Heinrich Barth made a prolonged stay in various Hausa cities at dates between 1851 and 1855. To Barth is due a great deal of our knowledge of the country. In Barth's time American merchants were established on the Niger, bartering goods in exchange for slaves. This traffic was carried on through Nüpe "to the great damage," says Barth, "of the commerce and the most unqualified scandal of the Arabs, who think that the English, if they would, could easily prevent it." The over-seas traffic in slaves did not continue long after the date (1851) to which Barth referred, but slave-raiding by the Fula went on unchecked up to the moment of the British occupation of the country. At Sokoto the sultanship continued in the hands of Fodio's descendants, and the reigning sultan concluded in 1885 a treaty with the Royal Niger Company (then called the National African Company) which gave to the company certain rights of sovereignty throughout his dominions.

Submission to British Rule.

In 1900 the rights of the company were transferred to the Crown. In the course of the years 1900, 1901, 1902, British authority was established in the states bordering on the Niger and the Benue and in Bornu. The northern states declined to fulfil the conditions of the treaties negotiated with the Niger Company or to submit to the abolition of the slave trade, and in 1902 Sokoto and Kano openly defied the British power. A campaign was undertaken against them in the opening months of 1903 in which the British troops were entirely successful. Kano was taken in February 1903, and Sokoto after some resistance made formal submission on the 22nd of March following. From that day British authority was substituted for Fula authority throughout the protectorate. The emir of Sokoto took an oath of allegiance to the British Crown and Sokoto became a British province, to which at a later period Gando was added as a sub-province—thus making of Sokoto one of the double provinces of the protectorate.

The double province thus constituted has an area of about 35,000 sq. m., with an estimated population of something over 500,000. It includes the ancient kingdoms of Zamfara on the east and Argunga or Kebbi on the west. The dominions of the emir of Sokoto have suffered some diminutions by reason of British agreements with France relating to the common frontier of the two European powers in the western Sudan. The emir felt deeply the loss of territory ceded to France in 1904 but accepted the settlement with much loyalty. Like the emir of Kano the new emir of Sokoto worked most loyally with the British administration. The province has been organized on the same principle as the other provinces of Northern Nigeria. A British resident of the first class has been placed at Sokoto and assistant residents at other centres. British courts of justice have been established and British governors are quartered in the province. Detachments of civil police are also placed at the principal stations. The country has been assessed under the new system for taxes and is being opened as rapidly as possible for trade. After the establishment of British rule farmers and herdsmen reoccupied districts and the inhabitants of cities flocked back to the land, rebuilding villages which had been deserted for fifty years. Horse breeding and cattle raising form the chief source of wealth in the province. There is some ostrich farming. Except in the sandy areas there is extensive agriculture, including rice and cotton. Special crops are grown in the valleys by irrigation. Weaving, dyeing and tanning are the principal native industries. Fair roads are in process of construction through the province. Trade is increasing and a cash currency has been introduced.

The emir of Gando, treated on the same terms as the emirs of Kano and Sokoto, proved less loyal to his oath of allegiance and had to be deposed. Another emir was installed in his place and in the whole double province of Sokoto-Gando prosperity has been general. In 1906 a rising attributed to religious fanaticism occurred near Sokoto in which unfortunately three white officers lost their lives. The emir heartily repudiated the leader of the rising, who claimed to be a Mahdi inspired to drive the white man out of the country. A British force marched against the rebels, who were overthrown with great loss in March 1906. The leader was condemned to death in the emir's court and executed in the market place of Sokoto, and the incident was chiefly interesting for the display of loyalty to the British administration which it evoked on all sides from the native rulers. (See also NIGERIA; FULA; and HAUSA.)

Robinson, *Hausaland* (London, 1896); *The Annual Reports on Northern Nigeria*, issued since 1900 by the Colonial Office, London; Sir F. D. Lugard, "Northern Nigeria," in *Geo. Journ.* vol. xxiii., and Major J. A. Burdon, "The Fulani Emirates," ibid. vol xxiv. (both London, 1904). Except the last-named paper most of these authorities deal with many other subjects besides the Fula. (F. L. L.)

SOKOTRA (also spelt Socotra and formerly Socotora), an island in the Indian Ocean belonging to Great Britain. It is cut by 12° 30′ N., 54° E., lies about 130 m. E.N.E. of Cape Guardafui and about 190 m. S.E. of the nearest part of the coast of Arabia and is on the direct route to India by the Suez Canal. It is 72 m. long by 22 m. broad and has an area estimated at from 2000 to 3000 sq. m. It is the largest and most easterly member of a group of islands rising from adjacent coral banks, the others being Abd el Kuri, The Brothers (Semha and Darzi), and Kal Farun.

Physical Features.—From the sea Sokotra has an imposing appearance. The centre culminates in a series of rugged pinnacles—the Haghier mountains, which rise to nearly 5000 ft. above a high (1500 ft.) abutting and undulating limestone plateau, deeply channelled by valleys. At many parts of the north coast the edges of this plateau reach the shore in precipitous cliffs, but in others low plains, dotted with bushes and date-palms, front the heights behind. The southern shore is bordered nearly its entire length by a belt of drifted sand, forming the Nuget plain. On this side of the island there are but one or two possible anchoring grounds, and these only during the north-east monsoon. On the north coast there are no harbours; but fairly safe anchorages, even in the north-east winds, are available off Hadibu or under Haulaf, a few miles distant, and at Kallansayia, at the north-west end of the island.

Geology.—The fundamental rocks of the island are gneisses, through which cut the feldspathic granites which form the Haghier *massif*. Through these, again, pierce other granites in dikes or lava flows, and overlying the whole are limestones of Cretaceous and Tertiary age, themselves cut through by later volcanic eruptions. "In the Haghier hills," to quote Professor Bonney, "we have probably a fragment of a continental area of great antiquity, and of a land surface which may have been an 'ark of refuge' to a terrestrial fauna and flora from one of the very earliest periods of this world's history."

Climate.—From October to May the weather is almost rainless except in the mountains, where there are nightly showers and heavy mists. During this season the rivers, which are roaring torrents throughout the monsoon, are almost all lost in the dry, absorbent plains. The temperature of the coast area varies from 65° F. in the night to 85° F. in the day—in the hot season it may reach 95° F.; and on the mountains (3500 ft.), from 52° F. to 72° F. In the low grounds fever of an acute and hematuric form is very prevalent.

Flora and Fauna.—The fauna contains no indigenous mammals, a wild ass which roams the eastern plains, perhaps its oldest denizen, is probably of Nubian origin; while the domestic cattle, a peculiar, unhumped, small, shapely, Alderney-like breed, may be a race gradually developed from cattle imported at a distant period from Sind or Farther India. There are 67 species of birds known from Sokotra, of which 15 are endemic; of 22 reptiles, 3 genera and 14 species are peculiar; and of the land and fresh-water shells, to whose distribution great importance attaches, 44 species out of 47 are confined to the island. Among the other invertebrate groups there is also a large proportion of endemic species.

The flora is even more peculiar than the fauna. Aloes, dragon's-blood (*Dracaena*), myrrh, frankincense, pomegranate, and cucumber (*Dendrocycios*) trees are its most famous species. The phanerogams number 570, apportioned to 314 genera, and of these over 220 species and 98 genera are unknown elsewhere. The flora and also (though to a less degree) the fauna present not only Asian and Central African affinities, but, what is more interesting, Mascarene, South African and Antipodean-American relationships, indicating a very different distribution of land and water and necessitating other bridges of communication than now exist. The natural history of Sokotra, unravelled by the study of its geology and biology, has been summarized by Professor Balfour as follows:—

"During the Carboniferous epoch there was in the region of Sokotra a shallow sea, in which was deposited, on the top of the fundamental gneisses of this spot, . . . the sandstone of which we have such a large development in Nubia. . . . During the Permian epoch Sokotra may have been a land surface, forming part of the great mass of land which probably existed in this region at that epoch, and gave the wide area for the western migration of life which presently took place, and by which the eastern affinities in Sokotra may be explained. In early and middle Tertiary times, when the Indian peninsula was an island, and the sea which stretched into Europe washed the base of the Himalayan hills, Sokotra was in great part submerged and the great mass of limestone was deposited; but its higher peaks were still above water, and formed an island, peopled mainly by African species—the plants being the fragmentary remains of the old African flora—but with an admixture of eastern and other Asian forms. Thereafter it gradually rose, undergoing violent volcanic disturbance."

By this elevation "Madagascar would join the Seychelles, which in turn . . . would run into the larger Mascarene Islands. In this way, then, Africa would have an irregular coast-line, prolonged greatly south of the equator into the Indian Ocean, and running up with an advance upon the present line until it reached its north-west limit outside and south of Sokotra. Thence an advanced land surface of Asia would extend across the Arabian Sea into the Indian peninsula." Sokotra thus "again became part of the mainland, though it is likely for only a short period, and during this union the life of the adjacent continent covered its plains and filled its valleys. Subsequently it reverted to its insular condition, in which state it has remained." The Antipodean-American element in the Sokotran flora probably arrived via the Mascarene Islands or South Africa from a former Antarctic continent.

Inhabitants.—The inhabitants, believed to number from 10,000 to 12,000, are composed of two, if not more, elements. On the coast the people are modern Arabs mixed with negro, Indian and European blood; in the mountains live the true Sokotri, supposed to be originally immigrants from Arabia, who have been isolated here from time immemorial. Some of them are as light-skinned as Europeans, tall, robust, thin-lipped, straight-nosed, with straight black hair; others are shorter and darker in complexion, with round heads, long noses, thick lips, and scraggy limbs, indicating perhaps the commingling of more than one Semitic people. Their manner of life is simple in the extreme. Their dwellings are circular, rubble-built, flat, clay-topped houses, or caves in the limestone rocks. They speak a language allied to the Mahra of the opposite coast of Arabia. Both Mahra and Sokotri are, according to Dr H. Müller, daughter-tongues of the old Sabaean and Minaean, standing in the same relation to the speech of the old inscriptions as Coptic does to that of the hieroglyphics. The Sokotran tongue has been, he believes, derived from the Mahra countries, but it has become so differentiated from the Mahra that the two peoples understand each other only with difficulty. Sokotri is the older of the two languages, and retains the ancient form, which in the Mahran has been modified by Arabic and other influences. Hadibu, Kallansayia and Khadup are the only places of importance in the island. Hadibu, or Tamarida (pop. about 400) the capital, is picturesquely situated on the north coast at the head of the open bay of Tamarida on a semicircular plain enclosed by spurs of the Haghier mountains. A dense grove of date palms surrounds the village.

Trade and Products.—The chief export is ghi or clarified butter, which is sent to Arabia, Bombay and Zanzibar. Millet, cotton and tobacco are grown in small quantities. The most valuable vegetable products are aloes and the dragon's-blood tree. The Sokotran aloe is highly esteemed; in the middle ages the trade was mostly in these products and in ambergris. The people live mainly on dates and milk. They own large numbers of cattle, sheep and goats. Dates are both home-grown and imported.

History.—Sokotra has claims to be reckoned one of the most ancient incense-supplying countries. Among the "harbours of incense" exploited by various Pharaohs during some twenty-five centuries it is impossible to believe that the island could be missed by the Egyptian galleys on their way to the "Land of Punt," identified by several writers with Somaliland; nor that, though the roadsteads of the African coast were perhaps oftener frequented, and for other freights besides myrrh and frankincense, the shores of Sokotra were neglected by such ardent explorers as those, for instance, of Queen Hatshepsut of the 18th dynasty. They would have found on the island, which is probably referred to under the name "Terraces of Incense" (from its step-like contours), the precious "auta trees"—whose divine dew, for use in the service of their gods, was their special quest—in greater abundance and in a larger number of species than any other country.

To the Greeks and Romans Sokotra was known as the isle of Dioscorides; this name, and that by which the island is now known, are usually traced back to a Sanskrit form, Dvīpa-Sakhādhāra, "the island abode of bliss," which again suggests an identification with the νῆσοι εὐδαίμονες of Agatharchides (§ 103). The *Periplus* of the Erythraean Sea speaks of the island as peopled only in one part by a mixed race of Arab, Indian and Greek traders. It was subject to the king of the Incense Country, and was a meeting-place of Arabian and Indian ships. Cosmas in the 6th century says that the people spoke Greek and were largely Christian, with a bishop sent from Persia. The Arab geographers also had a tradition of an early Greek settlement (which they ascribe to Alexander), but also of later Persian influence, followed by a settlement of Mahra tribes, who partly adopted Christianity. The Sokotri appear to have remained Nestorian Christians, with a bishop under the metropolitan of Persia, through the middle ages, though there are indications pointing to a connexion with the Jacobite church. As early as the 10th century Sokotra was a haunt of pirates; in the 13th century Abulfeda describes the inhabitants as "Nestorian Christians and pirates" but the island was rather a station of the Indian corsairs who harassed the Arab trade with the Far East. The population seems in the middle ages to have been much larger than it is now; Arabian writers estimate the fighting men at 10,000.

The Portuguese under Tristão da Cunha and Albuquerque seized Sokotra in 1507 in pursuance of the design to control all the trade routes between Europe and the East, Sokotra being supposed to command the entrance to the Red Sea. But on the capture of Goa and the building of a fortress there Albuquerque caused the fort which da Cunha had had built at Coco (Tamarida to be dismantled (1511), and though Portuguese ships subsequently raided the island they made no other settlement on it. The Portuguese found that Sokotra was held by Arabs from Fartak, but the "natives" (a different race) were Christians, though in sad need of conversion. This pious work Portuguese priests attempted, but with scant success. However, as late as the middle of the 17th century the Carmelite P. Vincenzo found that the people still called themselves Christians, and had a strange mixture of Jewish, Christian and Pagan rites. The women were all called Maria. No trace of Christianity is now found in the island, all the inhabitants professing Islam.

A certain dependence (at least of places on the coast) on some sovereign of the Arabian coast had endured before the occupation of Tamarida by da Cunha, and on the withdrawal of the Portuguese this dependence on Arabia was resumed. In the 19th century Sokotra formed part of the dominions of the sultan of Kishin. The opening of the Suez Canal route to India led to the island being secured for Great Britain. From 1876 onward a small subsidy has been paid to the sultan of Kishin by the authorities at Aden; and in 1886 the sultan concluded a treaty formally placing Sokotra and its dependencies under the protection of Great Britain. Sokotra is regarded as a dependency of Aden, but native rule is maintained, thc local governor or viceroy of thc sultan of Kishin being a member of that chief's family, and also styled sultan. Since it came under British control the island has been visited by various scientific expeditions. Professor Bayley Balfour made an investigation in 1880, expeditions were headed by Drs Riebeck and Schweinfurth in 1881, by Theodore Bent in 1897, and by Dr H. O. Forbes and Mr Ogilvie-Grant (who also visited Abd-el-Kuri) in 1898–1899. Simultaneously with the last named a further expedition, conducted by Professor D. H. Müller, under the auspices of the Imperial Academy of Sciences of Vienna, visited Sokotra, Abd-el-Kuri and some other islets of the group to investigate their geology and languages. With the Indian government the relations of the Sokotri have occasionally been strained, owing to their piratical tendencies.

Abd-el-Kuri island lies 60 m. W.S.W. of Sokotra, and 53 m. E.N.E. from Cape Guardafui, is 20 m. long by 3½ m. in width. At either end the island is hilly, the central part being a low plateau. On the north side is a sandy beach; on the south cliffs rise abruptly from the ocean. The highest part of the island is towards its eastern end, where the hills rise to 1670 ft. It is largely arid and there are no permanent streams. Its zoology resembles that of Sokotra, but the fauna includes land shells and scorpions peculiar to Abd-el-Kuri. The inhabitants, who number one to two hundred, speak Sokotri and Arabic and are chiefly engaged in diving for pearl shell on the Bacchus Bank N.E. of the island. They live chiefly on turtle (which abounds in the island), fish and molluscs. The land is nowhere cultivated.

Kal Farun is the name of two rocky islets rising nearly 300 ft. above the sea 13 m. N.N.E. of the western end of Abd-el-Kuri. Birds flock to them in great numbers; in consequence they are completely covered with guano, which gives them a snow-white appearance. The Brothers (often called by the older navigators The Sisters) lie between Abd-el-Kuri and Sokotra. Semha is 6½ m. long and 3 m. broad. It has rocky shores and rises in a table-shaped mountain to 2440 ft. As in Abd-el-Kuri ambergris is found on its shores and turtles abound. There is running water all the year. It is a fishing ground of the Sokotri. Darzi lies 9 m. E. by S. of Semha, is 3½ m. long by 1 m. broad and rises almost perpendicularly from the sea to 1500 ft. The top is flat. The coral banks which surround Sokotra and The Brothers are united and are not more than 30 fathoms below sea-level; a valley some 100 fathoms deep divides them from the bank around Abd-el-Kuri, while between Abd-el-Kuri and Cape Guardafui are depths of over 500 fathoms.

See, for the history of Sokotra, Yule, *Marco Polo* (1903 ed.) ii. 406–410, and, besides the authorities there cited, Yakut, *s.v.*; Hamdānī p. 52; Kazwini ii. 54. Kossmat, *Geologie der Inseln Sokotra, Semha und Abd el Kūri* (Vienna, 1902); R. V. Wettstein in *Vegetationsbilder* (3rd series, 5th pt., Jena, 1906). See also J. Jackson, *Socotra, Notes bibliographiques* (Paris, 1892), a complete bibliography to the year of publication. (H. O. F.; X.)

SOLANACEAE, in botany, an order of Dicotyledons belonging to the sub-class Sympetalae (or Gamopetalae) and to the series Tubiflorae, containing 75 genera with about 1500 species, widely distributed through the tropics, but passing into the temperate zones. The chief centre of the order lies in Central and South America; 32 of the genera are endemic in this region. It is represented in Britain by three genera including 4 species: *Hyoscyamus niger* (henbane), *Solanum Dulcamara* (Bittersweet) and *S. nigrum* and *Atropa Belladonna* (Deadly Nightshade).

The plants are herbs, shrubs or small trees. *Solanum nigrum*, a common weed in waste places, is a low-growing annual herb; *S. Dulcamara* is an irregularly climbing herb perennial by means of a widely creeping rhizome; *Atropa Belladonna* is a large perennial herb. The genus *Solanum*, to which belong more than half the number of species in the order, contains plants of very various habits including besides herbs, shrubs and trees. The leaves are generally alternate, but in the flower-bearing parts of the stem are often in pairs, an arrangement which, like the extra-axillary position of the flowers or cymes, results from a congenital union of axes. Thus in *Datura* (thorn apple) (fig. 1 A), where the branching is dichasial, the leaf which originates at any given node becomes

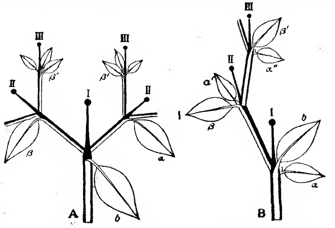

Fig. 1.—Diagrams illustrating branch development in Solanaceae, in A. *Datura Stramonium*, B. *Atropa Belladonna*.

I, II, III, Flowers on inflorescences of successive orders; *b*, bract of I; *α*, *β*, bracts of II; *α'*, *β'*, bracts of III, and so on. In A the branching is dichasial and the bracts are adnate to their axillary shoots up to the points at which the next branches arise; thus *α* and *β* appear to arise from axis II, though in reality originating on axis I. In B the branching is cincinnal, one of the two branches at each node is undeveloped and its bract *α*, *α'*, *α"* is smaller than the other member of the pair, *β*, *β'*, which is adnate to and apparently carried up on its axillary branch.

raised upon its axillary shoot as far as the next higher node, from which it appears to spring. In *Atropa Belladonna* (fig. 1 B) one of the branches at each node is undeveloped and there is a pair of unequal leaves; the smaller subtends the branch which has not developed, the larger has been carried up from the node below.

An interesting anatomical feature is the presence in the stem of bicollateral bundles—that is, the vascular bundles have phloem on the inside as well as on the outside of the xylem.

The hermaphrodite, generally regular, flowers have the parts in fives, 5 sepals, 5 petals, 5 stamens in alternating whorls, and two carpels, which are generally placed obliquely (see fig. 2, floral diagram). The sepals persist and often become enlarged in the fruit. The

Fig. 2.—Floral diagram of *Solanum*—the arrow indicates the oblique symmetry of the flower.

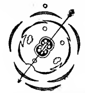

Fig. 3.—Floral diagram of *Schizanthus*—the arrow indicates the oblique symmetry. Two stamens only are functional.

corolla is regular and rotate as in *Solanum* (fig. 2), or bell-shaped as in *Atropa*, or somewhat irregular as in *Hyoscyamus*; in the tribe Salpiglossideae, which forms a link with the closely allied order Scrophulariaceae, it is zygomorphic, forming, *e.g.* as in *Schizanthus* (fig. 3), a two-lipped flower. The stamens are inserted on the corolla tube and alternate with its lobes; in zygomorphic flowers only two or four fertile stamens are present; the bilocular anthers open by slits or pores (fig. 4). The flowers are generally conspicuous and adapted to insect pollination; honey is secreted on the disk at the base of the ovary or at the bottom of the corolla tube between the stamens. The ovary is usually bilocular, but in *Capsicum* becomes unilocular above, while in some cases an in-growth of a secondary septum makes it 4-celled as in *Datura*, or irregularly 3- to 5-celled as in *Nicandra*. The anatropous ovules are generally numerous on swollen axile placentas, sometimes few as in *Cestrum*, a large American genus with tubular flowers, species of which are grown in Britain as greenhouse plants; the simple style bears a bilobed or sometimes capitate stigma (fig. 5). The fruit is a many-seeded berry, as in *Solanum*, or

Fig. 4.—Stamen of a species of *Solanum*, showing the divergence of the anther-lobes at the base, and the dehiscence by pores at the apex *a*.

capsule. as in *Datura*, where it splits lengthwise, and *Hyoscyamus* (fig. 6), where it opens by a transverse lid forming a pyxidium. The embryo is bent or straight and embedded in endosperm. The persistent calyx may serve to protect the fruit or aid in its distribution, as in the bladdery structure enveloping the fruit of *Physalis* or the prickly calyx of species of *Solanum*.

FIG. 5.—The pistil of Tobacco (*Nicotiana Tabacum*), consisting of the ovary *o*, containing ovules, the style *s*, and the capitate stigma *g*. The pistil is placed on the receptacle *r*, at the extremity of the peduncle.

The order is divided into 5 tribes; the division is based on the greater or less curvature of the embryo, the number of ovary cells and the regular or zygomorphic character of the flower. The great majority of the genera belong to the tribe Solaneae, which is characterized by a 2-celled ovary. *Lycium* is a genus of trees or shrubs, often thorny, with a cylindrical or narrowly bell-shaped corolla and a juicy berry; *L. europaeum* is a straggling climber often cultivated under the name of tea-plant. For *Atropa* see NIGHTSHADE; *A. Belladonna* yields the drug atropin. For *Hyoscyamus* see HENBANE. *Physalis*, with 45 species mostly in

FIG. 6.—Seed-vessel (*pyxidium*) of Henbane (*Hyoscyamus niger*) opening by circumscissile dehiscence.

the warmer parts of North and South America, includes *P. alkekengi*, "winter cherry," and *P. peruviana*, "Cape gooseberry." *Capsicum* (*q.v.*) is widely cultivated for its fruit. which are the so-called chillies. *Solanum* contains 900 species, among which are *S. tuberosum* (potato; *q.v.*), *S. Lycopersicum* (tomato; *q.v.*), and the two British species already mentioned. For *Mandragora* see MANDRAKE. To the tribe Datureae, characterized by a 4-celled ovary, belongs *Datura; D. Stramonium* (thorn apple), sometimes found as an escape in Britain, is officinal. *Nicotiana*, to which belong the tobacco plant (*N. tabacum*) and other cultivated species, and *Petunia*, are American genera belonging to the tribe Cestreae, in which the embryo is straight or only slightly bent, as it is also in the tribe Salpiglossideae, which is characterized by the zygomorphy of the flowers; *Salpiglossis* and *Schizanthus* are known in cultivation.

SOLAR, SOLLER (Lat. *solarium*, Fr. *galetas*, Ital. *solaio*), in architecture, a room in some high situation, a loft or garret, also an elevated chamber in a church from which to watch the lamps burning before the altars. The Latin *solarium* was used principally of a sundial, but also of a sunny part of a house.

SOLARIO, ANTONIO (*c.* 1382–1455), Italian painter of the Neapolitan school, commonly called Lo Zingaro, or The Gipsy. His father is said to have been a travelling smith. To all appearance Antonio was born at Civita in the Abruzzi, although it is true that one of his pictures is signed "Antonio de Solario Venetus," which may possibly be accounted for on the ground that the signature is not genuine. Solario is said to have gone through a love-adventure similar to that of the Flemish painter, Quintin Massys. He was at first a smith, and did a job of work in the house of the prime Neapolitan painter Colantonio del Fiore; he fell in love with Colantonio's daughter, and she with him; and the father, to stave him off, said if he would come back in ten years an accomplished painter the young lady should be his. Solario studied the art, returned in nine years, and claimed and obtained his bride. The fact is that Colantonio del Fiore is one of those painters who never existed; consequently his daughter never existed, and the whole story, as relating to these particular personages, must be untrue. Whether it has any truth, in relation to some unidentified painter and his daughter, is a separate question which we cannot decide. Solario made an extensive round of study—first with Lippo Dalmasio in Bologna, and afterwards in Venice, Ferrara, Florence and Rome. On returning to Naples he rapidly took the first place in his art. His principal performance is in the court of the monastery of S. Severino—twenty large frescoes illustrating the life of St Benedict, now greatly decayed; they present a vast variety of figures and details, with dexterous modelling and colouring. Sometimes, however, Lo Zingaro's colour is crude, and he generally shows weakness of draughtmanship in hands and feet. His tendency is that of a naturalist—the heads lifelike and individual, and the landscape backgrounds better invented and cared for than in any contemporary. In the Studj gallery of Naples are three pictures attributed to this master, the most remarkable one being a "Madonna and Child Enthroned with Saints." The heads here are reputed to be mostly portraits. Solario initiated a mode of art new in Naples; and the works painted between his time and that of Tesauro (*c.* 1470) are locally termed "Zingareschi." He had many scholars, but not of pre-eminent standing—Nicola Vito, Simone Papa, Angiolillo Roccadirame, Pietro and Ippolito dal Donzello. It has often been said that Solario painted in oil, but of this there is no evidence.

SOLAR SYSTEM, in astronomy, the group of heavenly bodies, comprising the sun and the bodies which move around the sun as a centre of attraction, of which the Earth is one. These bodies may be classified as follows: first the *Sun*, ☉, distinguished as containing much the greater part of all the matter composing the system, being more than 600 times as massive as all the other bodies combined. It is this great mass which makes it the central one of the system. It is also, so far as is known, the only incandescent body of the system, and therefore the only one that shines by its own light. Secondly, *planets*. The bodies of this class consist of eight major planets moving round the sun at various distances, and of an unknown number of minor planets, much smaller than the major planets, forming a separate group. Thirdly, *satellites*, or *secondary planets* revolving around the major planets, and therefore accompanying them in their revolutions around the sun. A fourth class of bodies, the constitution of which is still in some doubt, comprises comets and meteors. These differ in that comets are visible either in a telescope or to the naked eye, and seem to be either wholly or partially of a nebulous or gaseous character, while meteors are, individually at least, invisible to us except as they become incandescent by striking the atmosphere of the earth. It is, however, an open question whether a comet is other than an accumulation of meteoric bodies (see COMET).

The major planets are separated into two groups of four each, between which the minor planets, for the most part, revolve. The arrangement of the major planets, with the numbers of their respective satellites thus far known, in the order of distance from the sun, is as follows:—

The first group in order—the smaller major planets—comprises:—

Mercury, ☿, with no known satellite;
Venus, ♀, with no known satellite;
The Earth, ⊕, with one satellite, the moon;
Mars, ♂, with two satellites.

Outside of this group lies the zone of minor planets or asteroids.

The outer group of major planets comprises:—

Jupiter, ♃, with eight satellites;
Saturn, ♄, with ten satellites;
Uranus, ⛢ or ♅, with four satellites;
Neptune, ♆, with one satellite.

The distances separating the individual orbits in each group seem to approximate to a certain order of progression, expressed in Bode's law (see BODE). But there is an obvious gap between the two groups of major planets which is filled by the group of minor planets. Taking the mean distance of this group as that of a planet, the distance of the major planets closely approximates to Bode's law, except in the case of Neptune.

A remarkable feature of the solar system, which distinguishes it from all other known systems in the universe, is the symmetry of arrangement and motion of its greater bodies. All the major planets and many of the minor planets revolve in elliptic orbits so nearly circular in form that the unaided eye would not notice the deviation from that form. But as the orbits are not centred on the sun, which is in a focus of each, the displacement of the seeming circle would be readily seen in the case of Mercury and of Mars. The same statements are true of the orbits of the satellites around their primaries. The major planets all move around the sun in the same direction, from west to east, in orbits but little inclined to each other. All the known minor planets have the same common direction, but their orbits generally have a greater eccentricity and mutual inclination. The general rule is that the satellites also move round in the same direction, and in orbits of moderate inclination. Exceptions occur in the case of the satellites of Uranus, which are nearly perpendicular to the plane of the orbit. The satellite of Neptune, and one satellite, Phoebe, of Saturn, are also quite exceptional, the direction of motion being retrograde.

For the elements of the orbits, and the general character of the several planets see PLANET. Details as to each are found under the respective names of the several planets. (S. N.)

SOLDER (derived through the French from Lat. *soldare*, to make *solidus*, firm), an alloy easily melted and used for uniting as by a metallic cement two metal surfaces, joints, edges, &c. (See BRAZING AND SOLDERING.)

SOLE (*Solea*), the most valuable of European flat-fishes.[1] For most people who look at fish merely from the culinary point of view, soles are of two kinds: true soles, with such varieties as Dover soles and Brixham soles (slips being the name applied to young specimens), and lemon soles, an inferior fish, which is no sole at all, but a sort of dab (*Glyptocephalus microcephalus*). Leaving out the latter, there are five species on the British coasts; the common sole (*Solea vulgaris*) the French sole, or sand sole lemon sole of Yarrell (*S. lascaris*), the thick-back (*S. variegata*), and the solenette or little sole (*S. lutea*). All these agree in the right side being coloured and bearing the eyes, in the elongate form, in the small eyes (separated by a space covered with scaly skin, in the small, twisted mouth, with minute teeth on the colourless side only), and with the snout projecting beyond the mouth and more or less hooked. All true soles are excellent, but the common species is the only one which, from its larger size, growing to a length of 26 in. and attaining maturity at a length of about 10 in., regularly appears on all the markets. It occurs from the south-west coast of Scandinavia, Mecklenburg and Great Britain to the Mediterranean. Most of the best fishing grounds for soles lie comparatively near land, though the spawning takes place some miles away.

Much information on the life history of the sole will be found in the monograph by J. T. Cunningham (Plymouth, 1890).

SOLEMN (Lat. *sollemnis*, *sollennis*, less correctly *solennis*, yearly, annual; from *sollus*=*totus*, whole, entire, Gr. ὅλος, and *annus*, year), properly that which occurs annually, hence at stated intervals, regular, established; the term being particularly used of religious rites or ceremonies which recur at stated intervals, hence festive, sacred, marked by religious ceremony or ritual, and so grave, impressive, serious, the most general current usage. Another branch of meaning stresses the formal, customary aspect; and hence in such phrases as "solemn act," probate in "solemn form," it means that which is done with all due forms and ceremonies.

SOLENT, THE, a strait of the English Channel, between the mainland (the coast of Hampshire, England), and the north-western coast of the Isle of Wight, forming the western entrance to Southampton Water, Spithead being the eastern. Its length, from the eastern shore of Southampton Water to the Needles rocks off the western extremity of Wight, is 15 m. The general breadth is from 2½ to 3 m., but between Stone Point on the mainland and Egypt Point on the north coast of Wight it narrows to 1¼ m.; and 3½ m. north of the Needles there springs from the mainland a great shingle bank, mostly only a few yards in breadth above water, but nearly 2 m. in length. It reduces the breadth of the Solent to a little over ¾ m., and broadens at the end, on which stands Hurst Castle, an important fortification dating from the time of Henry VIII. Here Charles I. was imprisoned in 1648. The coast of the mainland is low but picturesque, and is broken by the shallow estuaries of the Beaulieu River and the Lym, with the small port of Lymington upon it. The coast of Wight rises more steeply. On this side the Medina estuary opens northward, and those of the Newtown and the Yar north-westward into the strait. At the mouth of Southampton Water is a projecting bar resembling but smaller than that of Hurst Castle, and like it bearing a Tudor fortress, Calshot Castle. The Solent is frequently the scene of yacht races. The configuration of the coast causes a double tide in the strait.

SOLESMES, a village of western France on the left bank of the Sarthe in the department of Sarthe, 29 m. W.S.W. of Le Mans by road. In 1010 a priory was founded at Solesmes and placed under the authority of the abbey of La Couture of Le Mans. Suppressed at the revolution, it was established as a Benedictine monastery in 1830. In 1837 it was raised to the rank of abbey and became a centre of learning, the music here was also famous. A nunnery was afterwards founded beside it, but both institutions were abandoned after the passing of the associations law in 1901. The monastery, rebuilt at the end of the 19th century, forms a lofty mass of buildings on the river bank. Its church (13th and 16th centuries) is interesting only for the possession of two masterpieces of sculpture of uncertain authorship, executed approximately between 1490 and 1550. The most striking represents the burial of Christ and is sheltered by a stone structure, the front of which is beautifully carved. An arched opening in this front reveals the central group of eight figures surrounding the tomb, that of Mary Magdalen in the foreground being remarkably lifelike and expressive. The other work similarly enclosed represents the burial of the Virgin and is the later of the two in date and in the pure Renaissance style. Sculptures representing Jesus among the Doctors and other scenes are also in the church.

SOLETO, a village of Apulia, Italy, in the province of Lecce, from which it is 11 m. S. by rail, situated 299 ft. above sea-level. Pop. (1901), 3349. The Romanesque church of S. Stefano contains Byzantine frescoes of the 14th century similar to those in the subterranean chapel of the Santi Stefani at Vaste, south of Otranto, and others showing the formation of an independent style. The fine, richly decorated campanile adjoining the former cathedral was erected in 1397.

SOLEURE (Ger. *Solothurn*), one of the cantons of north-western Switzerland. Its total area is 305·5 sq. m., of which 294 sq. m. are reckoned as "productive," 111·3 sq. m. being covered by forests and ·29 sq. m. by vineyards. Save two small districts in its southern portion the whole canton is situated in the Jura range, while it is said to be the most irregular in shape of all the Swiss cantons, this being accounted for by the fact that it consists simply of the territories won at different dates by the town from which it takes its name. It includes most of the Aar valley between the towns of Bienne and Aarau, neither of which is in the canton, while in its northern portion the waters join the Birs River, and in its southern portion is the last bit of the Emme before its junction with the Aar. It comprises three isolated districts, of which one (Steinhof) on the south is an "enclave" in the canton of Bern, while the others, Hofstetten, that includes the famous pilgrimage resort of Mariastein, and Klein Lützel, are on the Alsatian frontier, and bounded by the cantons of Bern and of Basel. The highest point in the canton is the Hasenmatt (4748 ft.) which forms the culminating summit of the Weissenstein ridge, that rises just north-west of the town of Soleure, and boasts of an hotel well-known as a great centre for the air and whey cure. The canton is well supplied in its southern portion with railways, the main line from Bienne to Aarau running through it past the great junction of Olten, where the direct lines from Lucerne by the St Gotthard, from Bern, from Zürich, and from Basel all unite. Formerly the districts composing the canton were in the dioceses of Lausanne,

[1] The American sole (*Achirus fasciatus*) is a small flat-fish of inferior quality.

Basel and Constance, but since the complete reorganization of 1814 they are all in the diocese of Basel, the bishop of which has his chair in Soleure. In 1900 the population was 100,762, of whom 97,930 were German-speaking, 1912 French-speaking, and 829 Italian-speaking, while 69,461 were "Catholics" (the census does not distinguish between Romanists and Christian Catholics, who are still fairly strong here), 31,012 Protestants, and 159 Jews. The capital is Soleure, while the only other important town is Olten (6969 inhabitants). Between Soleure and Granges or Grenchen (5202 inhabitants) is the village of Selzach, where since 1893 a passion-play has been performed every summer by the inhabitants.

Till about 1850 the canton was mainly agricultural and pastoral, its pastures numbering 209, capable of supporting 4179 cows and of an estimated capital value of 2,395,215 francs. Nowadays it is distinguished for the variety of its industries, especially in and around Soleure and Olten, among them being watch-making, shoe-factories, cotton-spinning and cement factories.

The canton is divided into ten administrative districts, that comprise 132 communes. The present cantonal constitution dates from 1887, but was revised as to some important points in 1895. The *Kantonsrat*, or legislative assembly, is elected (since 1895 according to the principles of proportional representation) by all citizens over twenty years of age, in the proportion of one member to 800 inhabitants. Since 1895 the people have elected the *Regierungsrat* or executive, consisting of five members. In both cases the period of office is four years, though on the demand of 4000 citizens a popular vote must be taken as to whether the existing members shall continue to sit or not. In the canton the "obligatory referendum" and the "initiative" have obtained since 1875. By the former all laws passed by the legislative assembly, and all financial resolutions involving the expenditure of 100,000 francs, or of an annual sum of 15,000 francs, must be approved by a popular vote. By the latter 2000 citizens can compel the legislative assembly to consider any proposal for making a new law or for amending an old one. Further, the demand of the majority of the assembly or of 3000 citizens is sufficient to necessitate a popular vote as to the advisability of revising the constitution, the revised draft itself requiring a further popular vote. The two members of the federal *Ständerat* and the five members of the federal *Nationalrat* are also chosen by a popular vote.

(W. A. B. C.)

SOLEURE, the capital of the Swiss canton of that name, is an ancient little town, almost entirely situated on the left bank of the Aar. It was a Roman *castrum*, remains of which still exist, on the highway from Avenches to Basel, while its position at the foot of the Jura and close to the navigable portion of the Aar has always made it a meeting-point of various routes. Five railway lines now branch thence, while a sixth has been recently added, the tunnel beneath the Weissenstein to Moutier Grandval having been completed. It was strongly fortified in 1667–1727, but since 1830 these defences have been removed for reasons of practical convenience. Its chief building is the minster of SS Ursus and Victor, which dates from the 18th century, though it stands on the site of a far older edifice. Since 1828 it has been the cathedral church of the bishop of Basel, but in 1874 its chapter was suppressed. The ancient clock tower has a quaint 16th-century clock, while the older portions of the town-hall date still further back. The early 17th-century arsenal contains the finest collection of armour and old weapons in Switzerland, while the modern museum houses a splendid collection of fossils from the Jura, the specimens of Alpine rocks collected by F. J. Hugi (1796–1855), a native of Soleure, and a Madonna by the younger Holbein. The building now used as the cantonal school was formerly the residence of the French ambassadors to the Swiss confederation from 1530 to 1797. There are some fine 16th-century fountains in the little town, which in its older portions still keeps much of its medieval aspect, though in the modern suburbs and in the neighbouring villages there is a certain amount of industrial activity. The Polish patriot Kosciusko died here in 1817; his heart is preserved at Rapperswil, but his body is buried at Cracow. In 1900 the town had 10,025 inhabitants, almost all German-speaking, while there were 6098 "Catholics" (either Romanists or Christian Catholics), 3814 Protestants and 81 Jews. In 1904 there were twenty churches or chapels in the town itself. One mile north of the town is the Hermitage of St Verena, in a striking rock gorge, above which rises the Weissenstein ridge, the hotel on which (4223 ft.) is much frequented in summer for the air and whey cure as well as for the glorious Alpine panorama that it commands.

A 16th-century rhyme claims for the town of Soleure the fame of being the oldest place in "Celtis" save Trier. Certainly its name, "Salodurum," is found in Roman inscriptions, and its position as commanding the approach to the Rhine from the south-west has led to its being more than once strongly fortified. Situated just on the borders of Alamannia and Burgundy, it seems to have inclined to the allegiance of the latter, and it was at Soleure that in 1038 the Burgundian nobles made their final submission to the German king, Conrad II. The medieval town grew up round the house of secular canons founded in the 10th century in honour of St Ursus and St Victor (two of the Theban legion who are said to have been martyred here in 302) by Queen Bertha, the wife of Rudolph II., king of Burgundy, and was in the diocese of Lausanne. The prior and canons had many rights over the town, but criminal jurisdiction remained with the kings of Burgundy, then passed to the Zähringen dynasty, and on its extinction in 1218 reverted to the emperor. The city thus became a free imperial city, and in 1252 shook off the jurisdiction of the canons and took them under its protection. In 1295 we find it allied with Bern, and this connexion is the key to its later history. It helped Bern in 1298 in the great fight against the nobles at Dornbühl, and again at Laupen in 1339 against the jealous Burgundian nobles. It was besieged in 1318 by Duke Leopold of Austria, but he was compelled to withdraw. In the 14th century the government of the town fell into the hands of the gilds, whose members practically filled all the public offices. Through Bern, Soleure was drawn into association with the Swiss Confederation. An attempt to surprise it in 1382, made by the Habsburgs, was foiled, and resulted in the admittance of Soleure in 1385 into the Swabian League and in its sharing in the Sempach War. Though Soleure took no part in that battle, it was included in the Sempach ordinance of 1393 and in the great treaty of 1394 by which the Habsburgs renounced their claims to all territories within the Confederation. In 1411 Soleure sought in vain to be admitted into the Confederation, a privilege only granted to her in 1481 at the diet of Stans, after she had taken part in the Aargau, Italian, Toggenburg, and Burgundian Wars. It was also in the 15th century that by purchase or conquest the town acquired the main part of the territories forming the present canton. In 1529 the majority of the "communes" went over to the reformed faith, and men were sent to fight on Zwingli's side at Kappel (1531), but in 1533 the old faith regained its sway, and in 1586 Soleure was a member of the Golden, or Borromean, League. Though the city ruled the surrounding districts, the peasants were fairly treated, and hence their revolt in 1653 was not so desperate as in other places. Soleure was the usual residence of the French ambassador from 1530 to 1797, and no doubt this helped on the formation of a "patriciate," for after 1681 no fresh citizens were admitted, and later we find only twenty-five ruling families distributed over the eleven gilds. Serfage was abolished by Soleure in 1785. The old system of the city ruling over eleven bailiwicks came to an end in March 1798, when Soleure opened its gates to the French army, and it was one of the six "directorial" cantons under the 1803 constitution. In 1814 the old aristocratic government was set up again, but this was finally broken down in 1831, Soleure in 1832 joining the league to guarantee the maintenance of the new cantonal constitutions. Though distinctly a Roman Catholic canton, it did not join the "Sonderbund," and voted in favour of the federal constitutions of 1848 and 1874.

(W. A. B. C.)

SOLFATARA, a volcanic vent emitting vapours chiefly of sulphurous character, whence the name, from the Italian *solfo* (sulphur). The typical example is the famous Solfatara, near Puzzuoli, in the Phlegraean Fields, west of Naples. This is an old crater which has not been in active eruption since A.D. 1198, but which is continuously exhaling heated vapours, chiefly hydrogen sulphide, sulphur dioxide and steam. These issue from orifices in the crust, on the walls of which are yellow incrustations of sublimed sulphur, sometimes orange-red by association with arsenic sulphide, whilst the trachytic rocks of the volcano are bleached and corroded by the effluent vapours, with formation of such products as gypsum and alum. Sal ammoniac occurs among the sublimates. The term solfatara has been extended to all dormant volcanoes of this type; and a volcano which has ceased to emit lava or ashes but still evolves heated vapours, is said to have passed into the "solfataric stage." Examples are to be found in many volcanic districts. By French geologists the term *soufrière* is used instead of the Italian solfatara. (See VOLCANOES.)

SOLFERINO, a village of Lombardy, Italy, in the province of Mantua, 5 m. S.W. of San Martino della Battaglia (a railway station 72 m. E. of Milan on the line to Verona), situated 410 ft. above sea-level, on the south-west edge of the hills bordering the Lake of Garda on the south. Pop. (1901), 1350. It was the scene of a battle fought on the 24th of June 1859 between the allied Franco-Sardinian army under Napoleon III. and Victor Emanuel, and the Austrian army commanded by Francis Joseph II., in which, after a severe contest, the latter retired over the Mincio (see ITALIAN WARS). The battle fought by the Sardinians on the left wing of the allied army is often called by the separate title of San Martino, from a hamlet near the Brescia-Verona railway, about which it was fought. From this battle, a certain shade of blue was designated by the name of Solferino, and was very popular for some years, though now, unlike its companion "magenta," it is forgotten.

SOLI (mod. *Mezetlü*), an ancient town of Asia Minor, on the coast of Cilicia, between the rivers Lamus and Pyramus, from each of which it is about 62 m. Colonists from Argos in Greece and Lindus in Rhodes are described as the founders of the town, which is first mentioned at the time of the expedition of the younger Cyrus. In the 4th century B.C. it was so wealthy that Alexander exacted a fine of 200 talents. In the Mithradatic War, Soli was destroyed by Tigranes, but it was subsequently rebuilt by Pompey, who settled there many of the pirates whom he had captured, and called the town Pompeiopolis. Soli was the birthplace of Chrysippus the Stoic and of the poets Philemon and Aratus. The bad Greek spoken there gave rise to the term *σολοικισμός*, solecism, which has found its way into all the modern languages of Europe. The ruins, which lie on the right bank of the Mezetlü Su have been lately plundered to supply building material for Mersina, and little remains except part of the colonnade which flanked the main street leading to the harbour. The place is easily reached from Mersina by carriage in about 1½ hours. (D. G. H.)

SOLI, a Greek city on the north coast of Cyprus, lying at Soliais in the metalliferous country round Karavortasi near Lefka, on the south side of Mórphou Bay. Its kingdom was bounded by the territories of Marion, Paphos, Tamassus and Lapathus. It was believed to have been founded after the Trojan War (*c.* 1180) by the Attic hero Acamas; but no remains have been found in this district earlier than the Early Iron Age (*c.* 1000-800). The town of "Sillu," whose king Irisu was an ally of Assur-bani-pal of Assyria in 668 B.C., is commonly supposed to represent Soli.[1] In Hellenic times Soli had little political importance, though it stood a five months' siege from the Persians soon after 500 B.C.; its copper mines, however, were famous, and have left copious slag heaps and traces of small scattered settlements. A neighbouring monastery is dedicated to "Our Lady of the Slagheaps" (*Panagia Skourgiótissa*). But the copper seems to have been exhausted in Roman times, and thereupon Soli became desert.

See W. H. Engel, *Kypros* (Berlin, 1841; classical authorities); J. L. Myres and M. Ohnefalsch-Richter, *Cyprus Museum Catalogue*, (Oxford, 1899; antiquities): G. F. Hill, *Brit. Mus. Cat. Coins of Cyprus* (London, 1904; coins). (J. L. M.)

SOLICITOR, in England, an officer of the Supreme Court of Judicature qualified to conduct legal proceedings for his clients: see also ATTORNEY. Previous to the reign of Henry III. the common law considered it indispensable that the parties to a suit should be actually present, but the privilege of appearing by attorney was conceded in certain cases by special dispensation. The passing of the statute of Merton and subsequent enactments made it competent for both parties in all judicial proceedings to appear by attorney. Previous to the passing of the Judicature Act of 1873 there was a distinction between the terms "solicitor" and "attorney." Solicitors appear to have been at first distinguished from attorneys, as not having the attorney's power to bind their principals, but latterly the distinction was between attorneys as the agents formally appointed in actions at law, and solicitors who took care of proceedings in parliament, chancery, privy council, &c. In practice, however, and in ordinary language, the terms were synonymous. Down to the 17th century the solicitor of the chancery courts was considered inferior to the attorney of the common law courts, but the rapid growth of equity jurisdiction gave the solicitor an importance in no degree inferior to his fellow practitioner at the common law. Until 1873 it was usual for attorneys to be admitted as solicitors as well, but the Judicature Act of that year enacted that all persons admitted as solicitors, attorneys or proctors of an English court shall henceforth be called solicitors of the Supreme Court. Regulations regarding the qualification of attorneys are found as far back as the 20 Edward I. (1292), and the profession has been stringently regulated by a series of statutes passed during the 19th century, notably the Solicitors Act 1843 and the Solicitors Acts 1877 and 1888.

Every person, before he can become a duly qualified solicitor, must serve an apprenticeship or clerkship to a practising solicitor for a term of years varying from three to five, he must pass all the necessary examinations, he must be duly admitted and entered on the roll of solicitors kept by the Incorporated Law Society and must take out an annual certificate to practise. The organization of the profession is in the hands of the Incorporated Law Society. Established originally in 1827, in succession to an earlier society dating back to 1739, it was incorporated in 1831. It began courses of lectures for students in 1833 and ten years later was constituted registrar of attorneys and solicitors. In 1860 it obtained the power of suing unqualified solicitors and in 1888 it was given the custody of the roll of solicitors, on the abolition of the office of the clerk of the Petty Bag. The Solicitors Act of 1888 vested in the Incorporated Law Society the power of investigating complaints as to the professional conduct of solicitors, as well as power to refuse to renew the annual certificate of a solicitor, subject to the solicitor's right of appeal. The statutory committee of the Incorporated Law Society may make application to the court to strike a solicitor off the rolls without preliminary inquiry by the committee where he has been convicted of a criminal offence, but where he is alleged to have been guilty of unprofessional conduct or a statutory offence the committee first hold a preliminary inquiry. Apart from its judicial administrative authority it has exercised powerful influence in the attitude which it has frequently taken towards proposed legislation. Membership of the society, which is not compulsory, is open to any duly qualified practising solicitor, on approval by the council. No person, however duly qualified, can be admitted as a solicitor till he has attained the age of twenty-one years. Though admitted as a solicitor and his name entered on the roll he is not at liberty to practise until he has taken out his annual certificate, the fees for which vary according as the applicant

[1] E. Schrader, *Abh. K. Preuss. Ak. Wiss.* (1879), pp. 31–36.

intends to practise in London or the provinces. Solicitors now have a right to practise in any court, *i.e.* in every division of the High Court, in every inferior court, in the ecclesiastical courts (as proctors), in the court of appeal, in the privy council and in the House of Lords. Their right of audience, however, is restricted. They may appear as advocates in most of the inferior courts, as before justices, magistrates, coroners, revising barristers and county courts. They have no right of audience, however, in the Mayor's court, London, nor in the High Court of Justice, privy council or House of Lords, where, from time immemorial, the right has pertained to the bar, but they have right of audience in chambers and certain bankruptcy matters. Since the Conveyancing Act 1881 solicitors may do all kinds of conveyancing, which formerly was considered the exclusive business of the bar. The Conveyancing Act 1881 having made great changes in the practice of conveyancing, it became necessary to place the remuneration of solicitors upon a new basis. This was done by the Solicitors Remuneration Act, passed on the same day as the Conveyancing Act. It provides for the framing of general orders, fixing the principles of remuneration with reference *inter alia* to the skill and responsibility involved, not, as was generally the case before, with reference simply to the length of the documents perused or prepared. A solicitor is not responsible for statements made by him in his professional capacity as an advocate, and all communications which pass between a solicitor and his client are privileged, so also is any information or document which he has obtained in his professional capacity on behalf of his client. The relation of solicitor and client disqualifies the former from dealing with his client on his own behalf, while it gives him a lien, on professional services, over the deeds, &c., of the client in his possession. A solicitor's remuneration is minutely arranged by statute and he has no power of recovering more from his client than his statutory charges, and he is liable to be sued for damages for negligence in his client's behalf. Certain personal privileges belong to a solicitor. He is free from serving on juries, nor need he, against his will, serve as a mayor, alderman, sheriff, overseer or churchwarden.

In Scotland solicitors in the Supreme Court are not, as in England, the only persons entitled to act as law agents. They share the privilege with writers to the signet in the Supreme Court, with agents at law and procurators in the inferior courts. They were formed into a society in 1784 and incorporated in 1796, and are usually recognized as members of the College of Justice. This difference is, however, now of little importance, as by the Law Agents Act 1873 any person duly admitted a law agent is entitled to practise before any court in Scotland. In the United States the term solicitor is used in some states in the sense of a law agent practising before a court of equity.

Many of the great public offices in England and the United States have their solicitors. In England the treasury solicitor fills an especially important position. He is responsible for the enforcement of payments due to the treasury, and conducts generally its legal business. The office of king's proctor is also combined with that of treasury solicitor. Under his powers as king's proctor the treasury solicitor acts as administrator of the personal estate of an intestate which has lapsed to the crown, and intervenes in cases of divorce where collusion is alleged (see under PROCTOR). Under the Prosecution of Offences Act 1884 he also acted as director of public prosecutions, and was sometimes called Crown Solicitor. By the Prosecution of Offences Act 1908 the office of director of public prosecutions was separated from that of treasury solicitor and made a separate appointment. In Ireland, solicitors called crown solicitors are attached to each circuit, their duty being to prepare the case for the crown in all criminal prosecutions. In the United States the office of solicitor to the treasury was created by Act of Congress in 1830. His principal duties are to take measures for protecting the revenue and to deal with lands acquired by the United States by judicial process or vested in them by security for payment of debts.

See E. B. V. Christian, *A Short History of Solicitors*; Cordery on *Solicitors*; and A. P. Poley, *Law Affecting Solicitors*.

SOLICITOR-GENERAL, in England, one of the law officers of the crown, appointed by letters patent. He is always a member of the House of Commons and of the political party in power, changing with it. His duties are practically the same as those of the attorney-general (*q.v.*), to whom he is subordinate, and whose business and authority would devolve upon him in case of a vacancy in the office. He receives a salary of £6000 a year, in addition to fees for any litigious business he may conduct on behalf of the crown. The position of the solicitor-general for Scotland in the main corresponds with that of the English solicitor-general. He is next in rank to the lord-advocate. In the United States the office of solicitor-general was created by Act of Congress in 1870.

SOLINGEN, a town of Germany, in the Prussian Rhine Province, on a height above the Wupper, 13 m. S.E. of Düsseldorf, and 20 m. N.E. of Cologne by rail. Pop. (1905), 49,018. Solingen is one of the chief seats of the German iron and steel industry, its speciality consisting in all kinds of cutlery, Solingen sword-blades have been celebrated for centuries, and are widely used outside Germany, while bayonets, knives, scissors, surgical instruments, files, steel frames and the like are also produced in enormous quantities. These articles are largely made by the workmen at their own homes and supplied to the dépôts of the large dealers; there are about 20,000 workers in steel in Solingen and the vicinity. Solingen received its municipal charter in 1374. Sword-blades have been made here since the early middle ages, and tradition affirms that the art was introduced during the Crusades by smiths from Damascus.

SOLINUS, GAIUS JULIUS, Latin grammarian and compiler, probably flourished during the first half of the 3rd century A.D. He was the author of *Collectanea rerum memorabilium*, a description of curiosities in a chorographical framework. Adventus, to whom it is dedicated, is identified with Oclatinius Adventus, consul A.D. 218. It contains a short description of the ancient world, with remarks on historical, social, religious and natural history questions. The greater part is taken from Pliny's *Natural History* and the geography of Pomponius Mela. According to Mommsen, Solinus also used a chronicle (possibly by Cornelius Bocchus) and a *Chorographia pliniana*, an epitome of Pliny's work with additions made about the time of Hadrian. Schanz, however, suggests the *Roma* and *Pratum* of Suetonius. The *Collectanea* was revised in the 6th century under the title of *Polyhistor* (subsequently taken for the author's name). It was popular in the middle ages, hexameter abridgments being current under the names of Theodericus and Petrus Diaconus.

The commentary by Saumaise in his *Plinianae exercitationes* (1689) is indispensable; best edition by Mommsen (1895), with valuable introduction on the MSS., the authorities used by Solinus, and subsequent compilers. See also Teuffel, *Hist. of Roman Literature* (Eng. trans., 1900), 389; and Schanz, *Geschichte der römischen Litteratur* (1904), iv. 1. There is an old English translation by A. Golding (1587).

SOLIPSISM (Lat. *solus*, alone, *ipse*, self), a philosophical term, applied to an extreme form of subjective idealism which denies that the human mind has any valid ground for believing in the existence of anything but itself. "It may best be defined, perhaps, as the doctrine that all existence is experience, and that there is only one experient. The Solipsist thinks that *he is the one!*" (Schiller). It is presented as a solution of the problem of explaining the nature of our knowledge of the external world. We cannot know things-in-themselves: they exist for us only in our cognition of them, through the medium of sense-given data. In F. H. Bradley's words (*Appearance and Reality*): "I cannot transcend experience, and experience is *my* experience. From this it follows that nothing beyond myself exists; for what is experience is its (the self's) states."

See IDEALISM; also F. C. S. Schiller, *Mind*, New Series (April 1909).

SOLÍS, ANTONIO DE (1610–1686), Spanish dramatist and historian, was born in 1610 at Alcalá de Henares (less probably, Plasencia), and studied law at Salamanca, where he produced a comedy entitled *Amor y obligación*, which was acted in 1627. He became secretary to the count of Oropesa, and in 1654 he was appointed secretary of state as well as private secretary to Philip IV. Later he obtained the lucrative post of chronicler of the Indies, and, on taking orders in 1667, severed his connexion with the stage. He died at Madrid on the 19th of April 1686. Of his ten extant plays, two have some place in the history of the drama. *El Amor al uso* was adapted by Scarron and again by Thomas Corneille as *L'Amour à la mode*, while *La Gitanilla de Madrid*, itself founded on the *novela* of Cervantes, has been utilized directly or indirectly by P. A. Wolff, Victor Hugo and Longfellow. The titles of the remaining seven are *Triunfos de amor y fortuna*, *Euridice y Orfeo*, *El Alcázar del secreto*, *Las Amazonas*, *El Doctor Carlino*, *Un Bobo hace ciento*, and *Amparar el enemigo*. *Amor y obligación* survives in a manuscript at the Biblioteca Nacional. The

Historia de la conquista de Méjico, covering the three years between the appointment of Cortes to command the invading force and the fall of the city, deservedly ranks as a Spanish prose classic. It was published in 1684; an English translation by Townshend appeared in 1724.

SOLITAIRE (Fr. for "solitary"), a game played on a board indented with 33 or 37 hemispherical hollows, with the same number of balls or marbles. An unoccupied hollow is left by removing one ball, and the balls, or pieces, are then captured as in draughts. No moves are allowed in diagonal directions or over more than one space at a time.

SOLO, or Solo Whist, a card game which is a modification of whist, the chief distinctive feature being that a single player generally has to oppose the other three. The game came into vogue in England towards the end of the 19th century. The following "declarations" can be made, the order being important: (1) proposition; (2) acceptance; (3) solo; (4) *misère*; (5) *abondance* (or abundance); (6) *misère ouverte*; (7) *abondance déclarée* (declared abundance). Proposition and acceptance go together, as will be seen; of the rest "solo" can be declared over "proposition," *misère* over solo, and so on. The stakes—regarding sixpence as the unit—are: for proposition, sixpence; for solo, sixpence (sometimes a shilling); for *misère*, a shilling; for abundance, eighteenpence; for open *misère*, two shillings; for declared abundance, three shillings. A further stake may be arranged for "overtricks," to be paid to the player for every trick made above the number proposed, and for "undertricks," to be paid by the player for every trick below that number.

A full pack is used; players cut as at whist for deal and seats; the cards may be dealt singly, but are more commonly dealt by threes, with a single card for the last round. The last card is turned up and left exposed for a round, whether it is used for trumps or not. One deal constitutes a game. The laws of whist obtain, where applicable, in such matters as following suit, revoking, the passing of the deal, &c. The player on the dealer's left is first to declare or pass: if he proposes, any player may accept, the right going first to the player on his left, but any player when his turn comes may make a higher declaration than any that has gone before him, though a player whose call has been superseded may amend his call afterwards. If all the players pass, either there is a new deal, or by arrangement there is a general *misère*, when the player who takes the most tricks—sometimes, the last trick—pays a single stake all round.

The Declarations.—(1) *Proposal*: This is an invitation to another player to "accept," *i.e.* to join the proposer in an attempt to make eight tricks. (2) *Solo*: Here a player undertakes to win five tricks, playing against the other three in combination. (3) *Misère*: This is a declaration by a player that he will not win a single trick. There are no trumps, but the turn-up card is left exposed for the first round. If the caller wins a trick the game is at an end (there are no overtricks or undertricks), but he has a right to see the opponents' hands, to be sure that no revoke has been made. A trick that has been turned may not be seen afterwards. (4) *Abundance* is a declaration that a player will make nine tricks single-handed. The caller makes any suit trumps, but abundance in the turn-up suit takes precedence over abundance in other suits. The trump suit must be declared after the other players have passed, before the first round is played. (5) *Misère ouverte*: This call is a declaration to lose all thirteen tricks, but after the first trick the caller's cards are placed on the table, though he may play them as he pleases. (6) *Declared Abundance*: This is a declaration of the caller to make all thirteen tricks by his own hand. He makes his own trumps and always leads, but a declaration in the suit of the turn-up card takes precedence over others. The game ends when the caller loses a trick. There are no undertricks.

SOLOGNE (*Secalaunia* from Lat. *secale*, rye), a region of north-central France extending over portions of the department of Loiret, Loir-et-Cher and Cher. Its area is about 1800 sq. m., and its boundaries are, on the N. the river Loire, on the S. the Cher, on the E. the districts of Sancerre and Berry. The Sologne is watered by the Cosson and the Beuvron, tributaries of the Loire, and the Sauldre, an affluent of the Cher, all three having a west-south-westerly direction. The pools and marshes which are characteristic of the region are due to the impermeability of its soil, which is a mixture of sand and clay. The consequent unhealthiness of the climate has been greatly mitigated since the middle of the 19th century, when Napoleon III. led the way in the reclamation of swamps, the planting of pines and other trees and other improvements. Arable farming and stock-raising are fairly flourishing in the Sologne, but there is little manufacturing activity, the cloth manufacture of Romorantin being the chief industry. Game is abundant, and the region owes much of its revived prosperity to the creation of large sporting estates.

SOLOLA, the capital of the department of Sololá, in Guatemala; on the northern shore of lake Atitlán, 46 m. W.N.W. of Guatemala city. Pop. (1905), about 17,000. Sololá is the ancient capital of the Cakchiquel Indians, who form the bulk of the population. In the city coarse cloth, pottery, cigars and soap are manufactured, and there is a large prison and reformatory. Among the surrounding mountains are large and successful coffee plantations, owned by German settlers. On the 18th of April 1902 Sololá was wrecked by an earthquake, but as most of the houses were constructed of wood it was speedily rebuilt.

SOLOMON[1] (10th century B.C.), the son of David by Bathsheba, and his successor in the kingdom of Israel. The many floating and fragmentary notes of various dates that have found a place in the account of his reign in the book of Kings (*q.v.*) show how much Hebrew tradition was occupied with the monarch under whom the throne of Israel reached its highest glory; and that time only magnified in popular imagination the proportions of so striking a figure appears from the opinions entertained of him in subsequent writings. The magnificence and wisdom of Solomon (cf. Matt. vi. 29; Luke xi. 31) and the splendour of his reign present a vivid contrast to the troublous ages which precede and follow him, although the Biblical records prove, on closer inspection, to contain so many incongruous elements that it is very difficult to form a just estimate of his life and character. A full account is given of the circumstances of the king's accession (contrast the summary notices, 1 Kings xxii. 41 seq., 2 Kings xv. 1, xxi. 24, xxiv. 18, &c.). He was not the true heir to the throne, but was the son of David by Bathsheba, wife of Uriah the Hittite, whom David sent to his death "in the forefront of the battle." The child of the illegitmate union died; the second was called Jedidiah ("beloved of Yah [weh]") or Shĕlōmōh (the idea of requital or recompense may be implied); according to 1 Chron. iii. 5, on the other hand, Solomon was the fourth, or rather the fifth, child of Bathsheba and David. The episode forms the prelude to family rivalries. David's first-born, Amnon, perished at the hands of the third son, Absalom, who lost his life in his revolt (2 Sam. xiii.-xx.). The second, Chileab, is not mentioned in the history, and the fate of the fourth, who regarded himself as the future king, is described in 1 Kings i., ii. Bathsheba, relying upon David's promise that Solomon should succeed him, vigorously advanced her son's claims with the support of Zadok the priest, the military officer Benaiah, and David's bodyguard; Adonijah, for his part, had David's old priest Abiathar, the commander Joab, and the men of Judah. A more serious breach could scarcely be imagined. The adherents of Solomon gained the day, and with his accession a new régime was inaugurated, not, however, without bloodshed.

Solomon's age at his accession is not recorded. The tradition that he was only twelve (1 Kings ii. 12 Septuagint; or fourteen, Jos. *Ant.* viii. 7, 8) may rest upon iii. 7 ("I am but a little child"; if this is not hyperbole), or upon the chronological scheme embodied in 2 Sam. xiii. 23, 38, xiv. 28, xv. 7. It agrees with his subordinate position in portions of ch. i., but his independent actions in ch. ii. suggest a more mature age, and according to xi. 42, xiv. 21, his son Rehoboam was already born (but contrast again xii. 24 Septuagint, 2 Chron. xiii. 7). See further, *Ency. Bib.* col. 4681, n. 5.

[1] Heb. *Shĕlōmōh*, as though "his peace"; but the true meaning is uncertain; evidence for its connexion with the name of a god is given by H. Winckler and Zimmern, *Keilinschr. u. das Alte Test.*, 3rd ed., pp. 224, 474 seq. The English form follows the Σολόμων of N.T. and Josephus; the Lat. *Salomo* agrees with Σαλώμων (one of several variant forms shown in MSS. of the LXX.).

The acute observation that 2 Sam. ix.–xx.; 2 Kings i. ii. 1–9, 13 sqq., were evidently incorporated after the Deuteronomic redaction of the books of Samuel (K. Budde, *Samuel*, p. xi.) is confirmed by the framework of Kings with its annalistic material similar to that preserved in 2 Sam. v.–viii., xxi.–xxiv.; 1 Kings ii. 10–12. With this may belong iii. 3 (the compiler's judgment); and especially v. 3 sqq., where reference is made to David's incessant wars (2 Sam. viii.). That 2 Sam. ix.–xx., &c., had previously been omitted by the Deuteronomic redactor himself (Budde) cannot be proved. These post-Deuteronomic narratives preserve older material, but with several traces of revision, so that 1 Kings i. ii. now narrate both the end of David's reign and the rise of Solomon (see I. Benzinger's commentary on Kings, p. xi.; C. Holzhey, *Buch d. Könige*, p. 17). The latter, however, is their present aim, and some attempt appears to have been made in them to exculpate one whose accession finds a Judaean parallel in Jehoram (2 Chron. xxi. 1–4). Thus it has been held that David's charges (ii. 1–9) were written to absolve Solomon, and there is little probability in the story that Adonijah after his pardon really requested the hand of Abishag (ii. 13–25), since in Oriental ideas this would be at once viewed as a distinct encroachment upon Solomon's rights as heir (cf. W. R. Smith, *Kinship and Marriage*, 2nd ed., p. 110).

Every emphasis is laid on the wisdom of Solomon and his wealth. Yahweh appeared to Solomon in a dream and offered to grant whatever he might ask. Confessing his inexperience, the king prayed for a discerning heart, and was rewarded with the gift of wisdom together with riches and military glory. There follows an example of his sagacity: the famous story of the steps he took to determine which of two claimants was the mother of a child (iii. 16-28).[1] His wisdom excelled that of Egypt and of the children of the East; by the latter may be meant Babylonia, or more probably the Arabs, renowned through all ages for their shrewdness. Additional point is made by emphasizing his superiority over four renowned sages, sons of Mahol; but the allusion to these worthies (who are incorporated in a Judaean genealogy, 1 Chron. ii. 6) is no longer intelligible. He is also credited with an interest in botany and natural history (iv. 33), and later Jewish legend improved this by ascribing to him lordship over all beasts and birds and the power of understanding their speech. To this it added the sovereignty over demons, from a wrong interpretation of Eccles. ii. 8 (see Lane, *Arabian Nights*, introd., n. 21, and ch. 1, n. 25). As his fame spread abroad, people came to hear his wisdom, and costly presents were showered upon him. The sequel was the visit of the Queen of Sheba (1 Kings iv. 29-34; x.). The interesting narrative appears in another light when we consider Solomon's commercial activity and the trading intercourse between Palestine and south Arabia.[2] His wealth was in proportion to his wisdom. Trading journeys were conducted with Phoenician help to Ophir and Tarshish. With the horse-breeding districts of the north he traded in horses and chariots (x. 28 seq.; see MIZRAIM), and gold accumulated in such enormous quantities that the income for one year may be reckoned at about £4,100,000 in weight (x. 11 seq., 14 sqq.). Silver was regarded as stones; the precious cedars of Lebanon as sycamores. His realm extended from Tiphsah (Thapsacus) on the Euphrates to the borders of Egypt (iv. 21, 24), and it agrees with this that he gains important conquests in the north (2 Chron. viii. 3 seq.; but see 1 Kings ix. 18). He maintained a very large harem (xi.), and among his wives was the daughter of an Egyptian Pharaoh. For his distinguished consort, who brought Gezer as a dowry, a special palace was built (iii. 1, ix. 16, 24), and this was only one of many building enterprises.

The description of the magnificent temple of Jerusalem, which occupies considerable space in Solomon's history (v.–viii.), appears in more elaborate form in the chronicler's later work. The detailed record stands in contrast to the brief account of his other buildings, *e.g.* the palace, which, from an Oriental point of view, was of the first importance (vii. 1-12). But the Temple and palace were adjoining buildings, separated only by a wall (cf. Ezek. xlii. 20, xliii. 7 seq.), and it cannot be said that the former had originally the prominence now ascribed to it. Nor can the accounts given by Deuteronomic writers of its significance for the religious worship of Israel be used for an estimate of contemporary religion (v. 1-6, viii.). Whatever David had instituted at Jerusalem, it is at Gibeon that Solomon observed the opening sacrificial ceremonies, and there he received the divine revelation, " for that was the great high-place " (iii. 4 sqq.). Though this is justified by a late writer (iii. 2), subsequent history shows that the high-places, like the altars to heathen deities in Jerusalem itself, long remained undisturbed; it was the Deuteronomic reformation, ascribed to Josiah, which marked the great advance in the religion of Yahweh, and under its influence the history of the monarchy has been compiled. Moreover, with the emphasis which is laid upon the Jerusalem Temple is to be associated the new superiority of Zadok, the traditional ancestor of the Zadokites, the Jerusalem priests, whose supremacy over the other Levitical families only enters into the history of a much later age (see LEVITES).

In fact, Solomon, the pious saint, is not the Solomon of the earlier writings. Political, commercial and matrimonial alliances inevitably left their mark upon national religion, and the introduction of foreign cults which ensued is characteristically viewed as an apostasy from Yahweh of which he was guilty *in his old age*.[3] The Deuteronomic writer finds in it the cause of the subsequent separation of the two kingdoms (xi. 1–13), and he connects it with certain external troubles which prove to have affected the *whole* course of his reign. The general impression of Solomon's position in history is in fact seriously disturbed when the composite writings are closely viewed. On the one side we see genial internal conditions prevailing in the land (iv. 20, 25), or the exalted position of the Israelites as officials and overseers, while the remnant of the pre-Israelite inhabitants serve in labour gangs (ix. 20 sqq.). On the other hand is the mass of toiling Israelites, whose oppressed condition is a prelude to the later dissensions (1 Kings v. 13 sqq.; cf. 1 Kings xii.; see the divergent tradition in 2 Chron. ii.). The description of Solomon's administration not only ignores the tribal divisions which play an important part in the separation of Israel from Judah (xii. 16; cf. 2 Sam. xix. 43–xx. 2), but represents a kingdom of modest dimensions in which Judah apparently is not included. Some north Judaean cities might be named (iv. 9 seq.), but south Judah and Hebron the seat of David's early power find no place, and it would seem as though the district which had shared in the revolt of Adonijah was freed from the duty of furnishing supplies. But the document has intricate textual peculiarities and may be the Judaean adaptation of a list originally written from the standpoint of the north-Israelite monarchy. Further speculation is caused when it is found that Solomon fortifies such cities as Megiddo, Beth-horon and Tamar, and that the Egyptian Pharaoh had slain the Canaanites of Gezer (ix. 15 sqq.). We learn, also, that Hadad, a young Edomite prince, had escaped the sanguinary campaign in the reign of David (2 Sam. viii. 13 seq.), and had taken refuge in Egypt. He was kindly received by Pharaoh, who gave him the sister of his queen Tahpenes to wife. On David's death he returned and ruled over Edom, thus not merely controlling the port of Elath and the trade-routes, but even (according to the Septuagint) oppressing Israel (xi. 14–22, 25, see Septuagint on *v.* 22).[4] Moreover, an Aramaean dependant

[1] For parallels, see R. Flint in Hastings's *Dict. Bib.* iv. 562, n. 1. For the Pompeian wall-painting representing Solomon's judgment (the figures are pygmies!), see A. Jeremias, *Altes Test. im Lichte d. alt. Orients* 2nd ed., p. 492 seq. (with illustration and references).

[2] For Mahommedan stories of Solomon, the hoopoe and the queen of Sheba, see the Koran, Sur. xxvii., which closely follows the second Targum to Esther i. 2, where the Jewish fables may be read in full. On this story, see also J. Halévy, *École pratique des hautes études* (1905), pp. 5–24, and the Chinese parallel in the *Mittheilungen* of the Berlin Seminar for Oriental Languages (1904), vii. i. pp. 117–172. For the late legends of Solomon see M. Grünbaum, *Neue Beiträge zur semit. Sage*, pp. 198–237 (Leiden, 1893); G. Salzberger, *Die Salomo-Sage in der semitischen Literatur* (Berlin, 1907).

[3] On the relation between trade and religion in old Oriental life, see the valuable remarks by G. A. Smith, *Ency. Bib.* col. 5157 seq.

[4] The narrative contains composite features (see the literature cited in article KINGS). There is a curious resemblance between one form of the story and the Septuagint account of the rise of Jeroboam (*q.v.*).

of Hadadezer, king of Zobah, to the north of Palestine (see David's war, 2 Sam. viii. 3 sqq., x. 6 sqq.), deserted his lord, raised a band of followers and eventually captured Damascus, where he established a new dynasty. Like Hadad, " he was an adversary to Israel all the days of Solomon " (xi. 23–25). To these notices must also be added the cession of territory in north Palestine to Hiram, king of Phoenicia (ix. 11). It is parenthetically explained as payment for building materials, which, however, are otherwise accounted for (v. 6, 11); or it was sold for 120 talents of gold (nearly £750,000 sterling), presumably to assist Solomon in continuing his varied enterprises—but the true nature of the transaction has been obscured, although the consequences involved in the loss of the territory are unmistakable. If these situations can with difficulty find a place in our picture of Solomon's might, it is clear that some of them form the natural introduction to the subsequent history, when his death brought internal discontent to a head, when the north under Jeroboam refused allegiance to the south, and when the divided monarchy enters upon its eventful career by the side of the independent states of Edom, Damascus and Phoenicia.

It is now generally recognized in histories of the Old Testament that a proper estimate of Solomon's reign cannot start from narratives which represent the views of Deuteronomic writers, although, in so far as late narratives may rest upon older material more in accordance with the circumstances of their age, attempts are made to present reconstructions from a combination of various elements. Among the recent critical attempts to recover the underlying traditions may be mentioned those of T. K. Cheyne (*Ency. Bib.*, art. " Solomon ") and H. Winckler (*Keilinschr. u. d. Alte Test.*, 3rd. ed., pp. 233 sqq.). But, in general, where the traditions are manifestly in a later form they are in agreement with later backgrounds, and it is questionable whether earlier forms can be safely recovered when it is held that they have been rewritten or when the historical kernel has been buried in legend or myth. It is impossible not to be struck with the growing development of the Israelite tribes after the invasion of Palestine, their strong position under David, the sudden expansion of the Hebrew monarchy under Solomon, and the subsequent slow decay, and this, indeed, is the picture as it presented itself to the last writers who found in the glories of the past both consolation for the present and grounds for future hopes. But this is not the original picture, and, since very contradictory representations of Solomon's reign can be clearly discerned, it is necessary in the first instance to view them in the light of an independent examination of the history of the preceding and following periods where, again, serious fluctuation of standpoint is found. Much therefore depends upon the estimate which is formed of the position of David (*q.v.*). See also JEWS: *History*, § 7 seq; PALESTINE: *Old Testament History*.

On Solomon's relation to philosophical and proverbial literature, see PROVERBS. Another aspect of his character appears in the remarkable " Song of Solomon," on which see CANTICLES. Still another phase is represented in the monologue of Ecclesiastes (*q.v.*) In the Book of Wisdom, again, the composition of an Egyptian Hellenist, who from internal evidence is judged to have lived somewhat earlier than Philo, Solomon is introduced uttering words of admonition, imbued with the spirit of Greek philosophers, to heathen sovereigns. The so-called Psalter of Solomon, on the other hand, a collection of Pharisee psalms written in Hebrew soon after the taking of Jerusalem by Pompey, and preserved to us only in a Greek version, has nothing to do with Solomon or the traditional conception of his person, and seems to owe its name to a transcriber who thus distinguished these newer pieces from the older " Psalms of David " (see SOLOMON, PSALMS OF). (S. A. C.)[1]

SOLOMON ISLANDS (Ger., *Salomoinseln*), an archipelago of the Western Pacific Ocean, included in Melanesia, and forming a chain (in continuation of that of the Admiralty Islands and New Mecklenburg in the Bismarck Archipelago) from N.W. to S.E. between 154° 40′ and 162° 30′ E., 5° and 11° S., with a total land area of 17,000 sq. m. (For map, see PACIFIC OCEAN.) A comparatively shallow sea surrounds the islands and indicates physical connexion with the Bismarck Archipelago and New Guinea, whereas directly east of the Solomons there are greater depths. The principal island at the north-west end of the chain is Bougainville (3900 sq. m.), and that at the south-east San Cristoval or Bauro. Between these the chain is double, consisting (from the north-west) of Choiseul (2260 sq. m.), Isabel (Ysabel, of about the same area as Choiseul) and Malaita (2400 sq. m.) to the north, and Vella Lavella, Ronongo, Kulambangra, Kausagi, Marovo (New Georgia or Rubiana) and the Hammond Islands, and Guadalcanar[2] or Guanbata (2500 sq. m.). Between and around these main islands there are many smaller islands. Ongtong Java, a coral reef of many islets, lies considerably north of the main group to which, geographically, it can hardly be said to belong.[3] Bougainville, the largest of the group, contains Mt Balbi (10,170 ft.), and two active volcanoes. In Guadalcanar is Mt Lammas (8000 ft.), while the extreme heights of the other islands range between 2500 and 5000 ft. The islands (by convention of 1899) are divided unequally between Great Britain and Germany, the boundary running through Bougainville Strait, so that that island and Buka belong to Germany (being officially administered from Kaiser Wilhelm's Land), but the rest (South Solomons) are British.

The islands are well watered, though the streams seem to be small; the coasts afford some good harbours. All the large and some of the small islands appear to be composed of ancient volcanic rock, with an incrustation of coral limestone showing here and there along the coast. The mountains generally fall steeply to the sea. There is some level land in Bougainville, but little elsewhere. Deep valleys separate the gently rounded ridges of forest-clad mountains, lofty spurs descend from the interior, and, running down to the sea, terminate frequently in bold rocky headlands 800 to 1000 ft. in height, as in San Cristoval (north coast). On the small high island of Florida there is much undulating grass-land interspersed with fine clumps of trees; patches of cultivated land surround its numerous villages, and plantations on the hill-sides testify to the richness of its soil. The whole chain of islands appears to be rising steadily. Some of the smaller islands are of recent calcareous formation. Barrier and fringing reefs, as well as atolls, occur in the group, but the channels between the islands are dangerous chiefly from the strong currents which set through them.

The climate is very damp and debilitating. The rainfall is unusually heavy. Fever and ague prevail on the coast. The healthiest portions are the highlands, where most exposed to the south-east trades. The dry season, with north-west winds, lasts from December to May. Vegetation is luxuriant; magnificent forests clothe the mountains, and sandalwood, ebony and lignum vitae, besides a variety of palms, are found in them. Mangrove swamps are common on the coasts. The probable geological connexion with New Guinea would account for the Papuan character of the fauna of the Solomons, which form the eastern limit of certain Papuan types. The existence of peculiar types in the Solomons, however, points to an early severance. Mammals are not numerous; they include the cuscus, several species of bat, and some rats of great size. There are various peculiar species of frogs, lizards and snakes, including the great frog *Rana Guppyi*, from 2 to 3 lb in weight. Of birds, several parrots and other genera are characteristically Papuan and are unknown east of the Solomons.

Population.—The Solomon islanders are of Melanesian (Papuan) stock, though in different parts of the group they vary considerably in their physical characteristics, in some islands approaching the pure Papuan, in some showing Polynesian crossings and in others resembling the Malays. As a race they are small and sturdy, taller in the north than in the south. Projecting brows, deeply sunk dark eyes, short noses, either straight or arched, but always depressed at the root, and moderately thick lips, with a somewhat receding chin, are general characteristics. The mesocephalic appears to be the preponderant form of skull; though this is unusual among Melanesian races. In colour the skin varies from a black-brown to a copperish hue, but the darker are the most common shades. The hair is naturally dark, but is often dyed red or fawn, and crisp, inclining to woolly. The islanders of the Bougainville Straits have lank, almost straight, black hair and very dark skins.

To strangers the natives have long had the reputation of being treacherous. They are cannibals, infanticide is common, and head

[1] Some sentences from W. R. Smith's article in *Ency. Brit.*, 9th ed., have been retained and in places modified.

[2] Guadalcanal of the Spanish discoverers.

[3] This group, so named by Abel Tasman in 1643, is also called Leuenewa or Lord Howe, and is densely inhabited by natives said to be of Polynesian origin.

hunting was formerly prevalent. The average lot of the women is that of slaves. In some cases there is belief in a good spirit inhabiting a pleasant land, and an evil spirit associated with a volcano; also in a future life. The language is of pure Melanesian type, though a number of dialects are spoken. The natives are good agriculturists. The Solomon Islands are, in the Pacific, the eastern limit of the use of the shield. The canoes are skilfully built of planks sewn together and caulked. The high carved prow and stern give the craft almost a crescent shape. These and the gunwale are tastefully inlaid with mother-of-pearl and wreathed with shells and feathers.

The British islands are under a resident commissioner, and have some trade in copra, ivory, nuts, pearl shell and other produce. Coco-nuts, pine-apples and bananas, with some cocoa and coffee, are cultivated on small areas. The German islands have a small trade in sandalwood, tortoise-shell, &c. The total population may be roughly estimated at 180,000.

History.—The Spanish navigator Alvaro Mendaña must be credited with the discovery of these islands in 1567, though it is somewhat doubtful whether he was actually the first European who set eyes on them. In anticipation of their natural riches he named them Islas de Salomon. The expedition surveyed the southern portion of the group, and named the three large islands San Cristoval, Guadalcanal and Ysabel. On his return to Peru, Mendaña endeavoured to organize another expedition to colonize the islands, but it was not before June 1595 that he, with Pedro Quiros as second in command, was able to set sail for this purpose. The Marquesas and Santa Cruz islands were now discovered; but on one of the latter, after various delays, Mendaña died, and the expedition collapsed.

Even the position of the Solomon Islands was now in uncertainty, for the Spaniards, fearing lest they should lose the benefits expected to accrue from these discoveries, kept secret the narratives of Mendaña and Quiros. The Solomon Islands were thus lost sight of until, in 1767, Philip Carteret lighted on their eastern shores at Gower Island, and passed to the north of the group; without, however, recognizing that it formed part of the Spanish discoveries. In 1768 Louis de Bougainville found his way thither. He discovered the three northern islands (Buka, Bougainville and Choiseul), and sailed through the channel which divides the two last and bears his name. In 1769 a French navigator, M. de Surville, was the first, in spite of the hostility of the natives, to make any lengthened stay in the group. He gave some of the islands the French names they still bear,[1] and brought home some detailed information concerning them which he called Terre des Arsacides (Land of the Assassins); but their identity with Mendaña's Islas de Salomon was soon established by French geographers. In 1788 the English lieutenant Shortland coasted along the south side of the chain, and, supposing it to be a continuous land, named it New Georgia; and in 1792 Captain Edward Manning sailed through the strait which separates Ysabel from Choiseul and now bears his name. In the same year, and in 1793, d'Entrecasteaux surveyed portions of the coast-line of the large islands. Dumont d'Urville in 1838 continued the survey.

Traders now endeavoured to settle in the islands, and missionaries began to think of this fresh field for labour, but neither met with much success, and little was heard of the islanders save accounts of murder and plunder. In 1845 the French Marist Fathers went to Isabel, where Mgr Epaulle, first vicar-apostolic of Melanesia, was killed by the natives soon after landing. Three years later this mission had to be abandoned; but in 1881 work was again resumed. In 1856 John Coleridge Patteson, afterwards bishop of Melanesia, had paid his first visit to the islands, and native teachers trained at the Melanesian mission college subsequently established themselves there. About this date the yacht "Wanderer" cruised in these seas, but her owner, Mr Benjamin Boyd, was kidnapped by the natives and never afterwards heard of. In 1873 the "foreign-labour" traffic in plantation hands for Queensland and Fiji extended its baneful influence from the New Hebrides to these islands. In 1893 the islands Malaita, Marovo, Guadalcanar and San Cristoval with their surrounding islets were annexed by Great Britain, and the final delimitation of German and British influence in the archipelago was made by the convention of the 14th of November 1899.

See H. B. Guppy, *The Solomon Islands* (London, 1887), where full references to earlier works are given; C. Ribbe, *Zwei Jahre unter den Kannibalen der Salomon-Inseln* (Dresden, 1903).

[1] He called Gower, Inattendue; Ulava, Contrarieté; and named Port Praslin, the harbour at the north-west of Ysabel.

SOLOMON, ODES OF, a collection of 42 hymns, probably dating from the end of the 1st century, known to the early Christian Church (as is proved by the quotations and comments in the 3rd century gnostic book, *Pistis Sophia*, and a short extract in the *Institutes* of Lactantius). They were recovered by Dr Rendel Harris in 1908 from a 16th-century Syriac manuscript (containing also the *Psalms of Solomon*, see below) in his possession. The first, second, and part of the third odes are missing, but the first has been restored from the *Pistis Sophia*. Of their authorship nothing is known, "Solomon" being a recognized pseudonym. While there are thoughts and expressions which lend themselves to gnostic use, there is nothing in the odes which is of distinctively gnostic origin. Many of them, indeed, are unmistakably Christian, and the writer of the *Pistis Sophia* seems to have regarded them as almost if not quite canonical, a fact which secures at latest a 2nd-century origin. Dr Harris indeed would date several of them between A.D. 75 and 100. They contain few traces of the New Testament, and the words "gospel" and "church" are not found. Here and there a Johannine atmosphere is detected, though not sufficiently to justify the assumption that the author knew the writer of the Fourth Gospel. References to the life and teaching of Christ are rare, though the Virgin Birth is alluded to in Ode 19 in a passage marked by legendary embellishment, and the descent into Hades is spoken of in quite the apocryphal style in Ode 42. These odes are probably among the latest in the book. There are no clear allusions to baptism and none at all to the eucharistic celebration. One passage speaks of ministers (perhaps = deacons) who are entrusted with the water of life to hand to others; the word "priest" occurs once, at the beginning of Ode 20, "I am a priest of the Lord, and to Him I do priestly service, and to Him I offer the sacrifices of His thought." The odes, which are perhaps the product of a school of writers, and were originally written in Greek, vary in execution and spiritual tone, but are generally characterized by a buoyant feeling of Christian joy. Harnack considers that they form a Jewish *Grundschrift*, with a number of Christian interpolations; only two are "purely Christian," while several "colourless" ones are more likely Jewish. He finds in them a link between the piety and theology of the *Testaments of the Twelve Patriarchs* and that of the Johannine gospel and epistles.

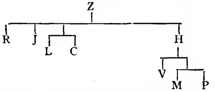
See J. Rendel Harris, *The Odes and Psalms of Solomon* (1909); *An Early Christian Psalter* (1909); Joh. Flemming and A. Harnack, *Ein jüdisch-christliches Psalmbuch aus dem ersten Jahrhundert* (Leipzig, 1910); *The Times* (April 7, 1910); W. E. Barnes, in *Journ. of Theol. Studies*, xi. 615, and *The Expositor* (July 1910); F. Spitta, in *Zeitschrift für N.T. Wissenschaft*, xi. 193.

SOLOMON, PSALMS OF. These psalms, eighteen in all, enjoyed but small consideration in the early Christian Church; for only six direct references to them are found in early Christian literature, though in the Jewish Church they must have played an important rôle; for they were used in the worship of the synagogue.

They were of course not written by Solomon, but were subsequently ascribed to him. The fact that they do not contain a single reference to Solomon is in favour of their having been first published anonymously. On the other hand, their author (or authors) may have placed over them the superscription "Psalms of Solomon" in order to gain currency for this new collection under the shelter of a great name of the past.

MSS. AND TEXTS.—Before the publication of Swete's second edition and the edition of von Gebhardt, only five MSS., A, H, V, M, P (of which H represents the Copenhagen MS.) were known, and these were utilized to the full in the splendid edition of Ryle and James (Ψαλμοὶ Σολομῶντος, *Psalms of the Pharisees commonly called the Psalms of Solomon, the Text newly revised from all the MSS.*, 1891). In Swete's edition (*The Old Testament in Greek*,[2] 1894) there was given in addition to the above a collation of the Vatican

MS. R. Finally in 1895, von Gebhardt published from five MSS. his edition entitled Ψαλμοὶ Σολομῶντος, *Die Psalmen Salomos zum erstenmale mit Benutzung der Athoshandschriften und des Cod. Casanatensis herausgegeben.* The five MSS. used by this last editor are C, H, J, L, R, of which C, J, L are exploited for the first time and represent respectively the MSS. Casanatensis, Iberiticus and Laura-Kloster. He represents the affinities of the MSS. in the following table, where Z stands for the archetype:—



Thus H is the only MS. common to this edition and that of Ryle and James; for Gebhardt regards the secondary MSS. V, M, P as not deserving consideration. Notwithstanding there is a much finer critical training for the student in the textual discussions and retroversions in the latter edition than in the former.

TRANSLATIONS.—Wellhausen, *Die Pharisäer und die Sadducäer* (1874), 131 sqq. This translation is unfortunately based on the *editio princeps* of De la Cerda published in 1626. Pick's translation which appeared in the *Presbyterian Review* for October 1883, pp. 775–813, is based on the same text and is imperfect owing to a faulty knowledge of English. Ryle and James (*op. cit.*). Kittel's translation (Kautzsch, *Apokr. u. Pseudep.* i. 1900, ii. 127 sqq.) was made from von Gebhardt's text.

The Original Language.—All modern scholars are practically agreed that the Psalms were written in Hebrew. It is unnecessary to enter into this question here, but a point or two might be mentioned which call for such a presupposition. (i.) First we find that, after the manner of the canonical Psalms, the musical symbol *διάψαλμα* (סֶלָה) is inserted in xvii. 31 and xviii. 10, a fact which points to their use in the divine worship in the synagogue. (ii) Next we find that a great number of passages cannot be understood unless by retroversion into Hebrew, when the source of the error becomes transparent. One such instance occurs in ii. 29, *τοῦ εἰπεῖν τὴν ὑπερηφανίαν τοῦ δράκοντος ἐν ἀτιμίᾳ*. Here *εἰπεῖν*, which is utterly meaningless, = לאמר a corruption of לקיר or לחקיר "to change," "turn" (Wellhausen). Thus we arrive at the sense required, "To turn the pride of the dragon into dishonour. (iii.) Finally, there are several passages where the text exhibits the future tense, when it ought to give the past imperfect. This phenomenon can easily be explained as a false rendering of the Hebrew imperfect.[1]

Date.—The date can be determined from references to contemporary events. Thus the book opens with the alarms of war (i. 2, viii. 1), in the midst of a period of great prosperity (i. 3, 4, viii. 7), but the prosperity is merely material, for from the king to the vilest of his subjects they are altogether sinful (xvii. 21, 22). The king, moreover, is no descendant of David, but has usurped his throne (xvii. 6–8). But judgment is at hand. "A mighty striker" has come from the ends of the earth (viii. 16), who when the princes of the land greeted him with words of welcome (viii. 18), seized the city (viii. 21), cast down its walls (ii. 1), polluted its altar (ii. 2), put its princes and counsellors to the sword (viii. 23), and carried away its sons and daughters captive to the west (viii. 24, xvii. 14). But the dragon who conquered Jerusalem (ii. 29), and thought himself to be more than man (ii. 32, 33), at last meets with shameful death on the shores of Egypt (ii. 30, 31).

The above allusions are easy to interpret. The usurping kings who are not descended from David are the Maccabeans. The "mighty striker" is Pompey. The princes who welcomed his approach are Aristobulus II. and Hyrcanus II. Pompey carried off princes and people to the west, and finally perished on the coast of Egypt in 48 B.C. Thus Ps. ii. was written soon after 48 B.C., while Ps. i., viii., xvii. fall between 63 and 48 B.C., for they presuppose Pompey's capture of Jerusalem, but show no knowledge of his death. Ps. v., vii., ix., xiii., xv. belong apparently to the same period, but iv. and xii. to an earlier one. On the whole Ryle and James are right in assigning 70–40 B.C. as the limits within which the psalms were written.

Authorship.—The authors were Pharisees. They divide their countrymen into two classes—"the righteous" (ii. 38–39, iii. 3–5, 7, 8), and "the sinners" (ii. 38, iii. 13, iv. 9); "the saints" (iii. 10) and "the transgressors" (iv. 11). The former are the Pharisees; the latter the Sadducees. The authors protest against the Asmonaean (*i.e.* the Maccabees) for usurping the throne of David and laying violent hands on the high priesthood (xvii. 5, 6, 8), and proclaim the coming of the Messiah, the true son of David (xvii. 23–25), who is to set all things right and establish the supremacy of Israel. The Messiah is to be pure from sin (xvii. 41), purge Jerusalem from the defilement of sinners and of the Gentiles (xvii. 29, 30, 36), destroy the hostile nations and extend his righteous rule over all the remaining peoples of the earth (xvii. 27, 31, 32, 34, 38).[2]

Ps. xvii., xviii. and i.–xvi. can hardly be assigned to the same authors. The hopes of the Messiah are confined to the former, and a somewhat different eschatology underlies the two works (see Charles, *Eschatology: Hebrew, Jewish and Christian*, 220–225).

In addition to the literature mentioned above, also in Ryle and James's edition and Schürer, *Gesch. des jüd. Volkes*, 3rd ed., iii. 150 sqq, see *Ency. Bib.* i. 241–245. (R. H. C.)

SOLON (7th and 6th century B.C.), Athenian statesman, the son of Execestides of the family of Codrus, was born about 638 B.C. The prodigality of his father made it necessary for Solon to maintain himself by trade, especially abroad. In his youth he became well known as the author of amatory poems and later of patriotic and didactic verse. Hence his inclusion among the Seven Sages. Solon's first public service was the recovery of Salamis from the Megarians. A law had been passed forbidding any reference to the loss of the island; Solon solved the difficulty by feigning madness, and reciting an inflammatory poem in the agora. It appears that Solon was appointed to recover the "fair island" and that he succeeded in expelling the Megarians. Sparta finally arbitrated in favour of the Athenians (*c.* 596), who ascribed their success to Solon. About a year later he seems to have moved a decree before the Amphictyons declaring war on Cirrha. At this period the distress in Attica and the accumulating discontent of the poorer classes, for whom Draco's code had proved inadequate, reached its height. Solon was summoned by all classes unanimously to discover a remedy; under the legal title of Archon, he received unlimited powers which he exercised in economic and constitutional reforms (see below). From various sources we learn that these reforms met with considerable opposition, to escape from which Solon left Athens for ten years. After visiting Egypt, he went to Cyprus, where Philocyprus, king of Aepea, received him with honour. Herodotus (v. 113) says that Philocyprus, on the advice of Solon, built himself a new town called, after his guest, Soli. The story that Solon visited Croesus in Lydia, and made to him the famous remark—"Call no man happy till he is dead"—is unfortunately discredited by the fact that Croesus seems to have become king nearly thirty years after Solon's legislation, whereas the story must be dated within ten years of it. Subsequently Solon returned to Athens, to find civil strife renewed, and shortly afterwards his friend (perhaps his relative) Peisistratus made himself tyrant. About 558 B.C. Solon died, and, according to the story in Diogenes Laërtius i. 62 (but see Plutarch's *Solon*, 32), his ashes were scattered round the island of Salamis. If the story is true, it shows that he was regarded as the oecist of Salamis.

Reforms.—The date of Solon's archonship has been usually fixed at 594 B.C. (Ol. 46. 3), a date given by Diog. Laërt. (i. 62) on the evidence of the Rhodian Sosicrates (fl. 200–128 B.C.; see Clinton, *Fast. Hell.* ii. 298, and Busolt, 2nd ed., ii. 259). The date 594 is confirmed by statements in the Aristotelian *Constitution of Athens* (ch. 14). For various reasons, the dates 592,

[1] In addition to Ryle and James, *Introd.* pp. lxxvii.–lxxxvii., see Perles, "Die Erklärung der Psalm. Sal." (*Oriental. Litteraturzeit.*, 1902, v. 7–10).

[2] The conception of the Messiah is vigorous, but the influence of such a conception was hurtful; for by connecting the Messianic with the popular aspirations of the nation, the former were secularized and the way prepared for the ultimate destruction of the nation.

591 and even 590 have been suggested by various historians (for the importance of this question see the concluding paragraph of this article). The historical evidence for the Solonian reforms has always been unsatisfactory. There is strong reason to conclude that in the 5th and 4th centuries there was no general tradition as to details. In settling differences there is no appeal to tradition, and this though there occur radical and insoluble contradictions. Thus the *Constitution of Athens* (ch. vi.) says that the Seisachtheia ("shaking off of burdens") consisted in a cancelling of all debts public and private, whereas Androtion, an elder contemporary, denies this specifically, and says that it consisted in the reduction of the rate of interest and the debasement of the coinage. The *Constitution* (ch. x.) denies the existence of any connexion between the coinage reform and the relief of debtors. The absence of tradition is further confirmed by the fact that the *Constitution* always appeals for corroboration to Solon's *Poems*. Of the *Laws* it is probable that in the 4th century, though some dealing with agrarian distress were in existence, those embodying the Seisachtheia were not, and few if any of the purely constitutional laws remained. The main source of the account in the *Constitution* is, therefore, the *Poems* of Solon, from which numerous quotations are made (see chs. 5–12).

The reforms of Solon may be divided under three heads—economic, constitutional and miscellaneous. They were necessary owing mainly to the tyrannical attitude of the rich to the poorer classes. Of these many had become slaves in lieu of payment of rent and loans, and thus the land had fallen gradually into the hands of the capitalists. It was necessary to readjust the economic balance and to provide against the evil of aristocratic and capitalist predominance.

A. *Economic Reforms.*—Solon's economic reforms consisted of the Seisachtheia and certain commercial laws (*e.g.* prevention of export trade except in olive oil, Plut. *Sol.* 24). Among all the problems connected with the Seisachtheia, it is clear (1) that Solon abolished the old Attic law of debt which permitted loans on the security of the debtor's person; (2) that he restored to freedom those who had been enslaved for debt; (3) that he refused the demand for the division of the land (γῆς ἀναδασμός). As to the cancelling of all debts (χρεῶν ἀποκοπή) there is some controversy; Gilbert and Busolt maintain that all debts were cancelled; strong reasons, may however, be advanced against it. It is possible that the statement in the *Constitution* is a hypothesis to explain the restoration of the slaves to freedom. Further, Solon seems to have regulated the accumulation of land (cf. in Rome the legislation of Tiberius Gracchus) and the rate of interest; and to have simplified commerce by replacing the Pheidonian standard by the Euboic, which was in use among the Ionian traders, in commerce with whom he foresaw that prosperity lay. It is impossible here to enter into the details of the controversy in connexion with Solon's land reforms; it must suffice to give the bare outlines of the dispute. There is no question that (1) the distressed class whom Solon sought to relieve were the *Hektemors*, and that (2) the achievement on which he prided himself was the removal of the ὅροι or stones which were seen everywhere in Attica, and were symbolic of the slavery of the soil. Almost all writers say that these ὅροι were mortgage-pillars: that they were originally boundary stones and that when land was mortgaged the terms of the agreement were carved on the stones, as evidence. Now firstly, though such mortgage-pillars existed in the time of Demosthenes, none are found earlier than the year 400 B.C., nor is there any reference before that year to this special sense of the word. If then these stones which Solon removed were mortgage-pillars, it is strange that none should have been found till two hundred years later. Secondly, it is highly improbable that the terms on which land was then cultivated admitted of mortgaging at all. The Hektemors, who, according to the *Constitution*, paid the sixth part of their produce as rent,[1] were not freeholders but tenants, and therefore, could not mortgage their land at all. From this it follows that when Solon said he had "removed the stones" he referred to the fatal accumulation of land by landowners. The tenants failed to pay rent, were enslaved, and the "boundary stone" of the landowner was moved forward to include their land. Thus the removal of the ὅροι was a measure against the accumulation of land in the form of enclosures (τεμένη), and fits in with the statement at the end of chapter iv. of the *Constitution*, "the land was in the hands of a few." It should be noted (1) that from this releasing of the land it follows that Solon's law against lending on the security of the person must have been retrospective (*i.e.* in order to provide a sufficient number of freeholders for the land released); and (2) that it is one of the most remarkable facts in Athenian economic history that when at the end of the Peloponnesian War a proposal was brought forward to limit the franchise to freeholders, it was found that only five thousand failed to satisfy this requirement.

[1] Others say they were: (1) labourers who received one-sixth of the produce as wages; (2) tenants who paid five-sixths as rent and kept one sixth, or (3) tenants who paid one-sixth as rent and kept five-sixths. As to (3) it is said such tenants could not have been in real distress, and as to (1) and (2) it is said that such a position would have meant starvation from the first.

B. *Constitutional Reforms.*—It is on this part of his work that Solon's claim to be considered a great statesman is founded. By his new constitution he laid the foundations of the Athenian democracy and paved the way for its later developments. It should be noted in the first place that the following account is written on the assumption that the Draconian constitution described in chapter iv. of the *Constitution of Athens* had never existed (see DRACO). In some respects that alleged constitution is more democratic than Solon's. This, coupled with the fact that Solon is always spoken of as the founder of democracy, is one of the strongest reasons for rejecting the Draconian constitution. It will be seen that Solon's state was by no means a perfected democracy, but was in some respects rather a moderate oligarchy in which political privilege was graduated by possession of land. To Solon are generally ascribed the four classes—Pentacosiomedimni, Hippeis, Zeugitae and Thetes. Of these the first consisted of those whose land produced as many measures (*medimni*) of corn and as many measures (*metretae*) of oil and wine as together amounted to 500 measures. The Hippeis (the horsemen, *i.e.* those who could provide a war-horse for the service of the state) were rated at over 300 and under 500 medimni; the third class (those who tilled their land with a yoke of oxen) at 200 medimni and the Thetes below 200 medimni. The Zeugites probably served as heavy-armed soldiers, and the Thetes were the sailors of the state. It is likely that the Zeugites were mainly Hektemors (see above) whom Solon converted into freeholders. Whether Solon invented these classes is uncertain, but it seems clear that he first put them into definite relation with the political organism. The Thetes (who included probably the servants of the Eupatridae, now secured as freemen), the fishermen of the Paralia (or sea-coast), and the artisans (*cerameis*) of Athens) for the first time received political existence by their admission to the sovereign assembly of the Ecclesia (*q.v.*). Of these classes the first alone retained the right of holding the offices of archon and treasurer; other offices were, however, opened to the second and third classes (*sc.* the Poletae, the Eleven and the Colacretae; see CLEISTHENES [I.] footnote). It is of the utmost importance to observe that the office of Strategus (*q.v.*) is not mentioned in connexion with Solon's reform. It is often said that Solon used his classification as the basis of a sliding scale of taxation. Against this, it is known that Peisistratus, whose faction was essentially the poorer classes, established a uniform 5% tax, and it is highly unlikely that he would have reversed an existing arrangement which was particularly favourable to his friends. The admission of the Thetes to the Ecclesia was an important step in the direction of democracy (for the powers which Solon gave to the Ecclesia, see ECCLESIA). But the greatest reform of Solon was undoubtedly the institution of the Heliaea (or courts of justice). The jury were appointed by lot from all the citizens (including the Thetes), and thus the same people elected the magistrates in the Ecclesia and subsequently tried them in the Heliaea. Hence Solon transferred the sovereign power from the areopagus and the magistrates to the citizens as a whole. Further, as the archons, at the expiry of their year of office, passed into the areopagus, the people exercised control over the personnel of that body also (see AREOPAGUS). In spite of the alleged Draconian constitution, alluded to above, it is still very generally held that Solon invented the Boulē or Council of Four Hundred, one hundred from each of the old tribes. The importance of this body as an advisory committee of the Ecclesia, and the functions of the Prytaneis are explained under BOULĒ. It is sufficient here to point out that, according to Plutarch's *Solon* (ch. 19) the state henceforth rested on two councils "as on anchors," and that the large powers exercised by the Cleisthenean Boulē were not exercised by the Solonian. From this, and the articles AREOPAGUS, BOULĒ, ECCLESIA and GREEK LAW, it will be seen that Solon contrived an absolutely organic constitution of a "mixed" type, which had in it the seeds of the great democratic growth which reached its maturity under Pericles. It should be added here, in reference to the election of magistrates under Solon's constitution, that there is discrepancy between the *Politics* and the *Constitution*; the latter says that Solon gave to the Thetes nothing but a share in the Ecclesia and the courts of justice, and that the magistrates were elected by a combination of selection and lot (κληρωτοὶ ἐκ προκρίτων), whereas the *Politics* says that Solon gave them only the power to elect the magistrates and try them at the end of their year. It seems likely for other reasons that the former scheme should be assigned to the years after Marathon, and, therefore, that the account in the *Politics* is correct (but see ARCHON).

C. *Miscellaneous.*—The miscellaneous laws of Solon are interesting primarily as throwing light upon the social condition of Athens at the time (see Evelyn Abbot, *History of Greece*, I. xiii. § 18).

In the matter of trade it has been said that he favoured one export only, that of olive oil, in which Athens was peculiarly rich; further he encouraged the settlement of aliens (*metoeci*) engaged in commerce, and compelled fathers to teach their sons a useful trade under penalty of losing all right to support in old age. The influence of women Solon regarded as most pernicious. Wealthy wives he forbade; no bride might bring more than three changes of raiment and a little light furniture to the house; all brothels and gymnasia were put under stringent state-control (see PROSTITUTION). Solon also regulated intestate succession, the marriage of heiresses, adoption, the use and sinking of wells, bee-farming, the planting of olives and figs, the cutting down of olive trees, the calendar. Further, he ordained that each citizen must show how he obtained his living (Herod. ii. 177) and must, under penalty of losing the franchise, adhere to one or other party in a sedition (for these laws see Plutarch's *Solon*, chs. 20–24).

The laws were inscribed on *Kyrbeis* or tablets framed in wood which could be swung round (hence also called *axones*). The boulē as a body swore to observe the laws, and each archon undertook to set up a life-size golden statue at Delphi if he should be convicted of transgressing them.

Solon appears to have supplemented his enactments by a law that they should remain in force for one hundred years, and according to another account that his laws, though not the best, should stand unchanged for ten years (Plut. *Solon*, 25; *Herod.* i. 29). Yet according to the *Constitution of Athens* (chs. 11–13) (without which the period from Solon to Peisistratus was a blank), when Solon went abroad in 593(?) the city was disturbed, and in the fifth year dissension became so acute that no archon was elected (for the chronological problem, see J. E. Sandys, *Constitution of Athens*, ch. 13, note); again four years later the same *anarchia* (*i.e.* no archon elected) occurred. Then four years later the archon Damasias (582 ?) continued in office illegally for two years and two months. The office of the archon was then put into commission of ten: five from the Eupatrids, three from the Agroeci and two from the Demiurgi, and for twenty years the state was in a condition of strife. Thus we see that twelve years of strife (owing to Solon's financial reforms) ended in the reversal of Solon's classification by assessment. We are, therefore, driven to conclude that the practical value of his laws was due to the strong and enlightened government of Peisistratus, whose tyranny put an end to the quarrels between the Shore, the Upland and the Plain, and the *stasis* of rich and poor.

See editions with notes of *Constitution of Athens* (*q.v.*); histories of Greece later than 1891 (*e.g.* Busolt, &c.). See also Gilliard, *Quelques réformes de Solon* (1907); Cavaignac, in *Revue de Philol.*, 1908. All works anterior to the publication of the *Constitution* are so far out of date, but reference should be made to the work of Grote. (J. M. M.)

SOLSTICE (Lat. *solstitium*, from *sol*, sun, and *sistere*, to stand still), in astronomy either of the two points at which the sun reaches its greatest declination north or south. Each solstice is upon the ecliptic midway between the equinoxes, and therefore 90° from each. The term is also applied to the moment at which the sun reaches the point thus defined.

SOLUNTUM (Gr. Σολόεις or Σολοῦς), an ancient town of Sicily, one of the three chief Phoenician settlements in the island, situated on the north coast, 10 m. E. of Panormus (Palermo), 600 ft. above sea-level, on the S.E. side of Monte Catalfano (1225 ft.), in a naturally strong situation, and commanding a fine view. The date of its first occupation is, like that of Panormus, unknown. It continued to be a Carthaginian possession almost uninterruptedly until the First Punic War, when, after the fall of Panormus, it opened its gates to the Romans. In the Roman period it seems to have been of no great importance; an inscription, erected by the citizens in honour of Fulvia Plautilla, the wife of Caracalla, was found there in 1857. It was perhaps destroyed by the Saracens and is now entirely deserted. Excavations have brought to light considerable remains of the ancient town, belonging entirely to the Roman period, and a good deal still remains unexplored. An archaic oriental Artemis sitting between a lion and a panther, found here, is in the museum at Palermo, with other antiquities from this site. With the exception of the winding road by which the town was approached on the south, the streets, despite the unevenness of the ground, which in places is so steep that steps have to be introduced, are laid out regularly, running from east to west and from north to south, and intersecting at right angles. They are as a rule paved with slabs of stone. The houses were constructed of rough walling, which was afterwards plastered over; the natural rock is often used for the lower part of the walls. One of the largest of them, with a peristyle, is currently, though wrongly, called the Gymnasium. Near the top of the town are some cisterns cut in the rock, and at the summit is a larger house than usual, with mosaic pavements and paintings on its walls. (T. As.)

SOLUTION (from Lat. *solvere*, to loosen, dissolve). When a solid such as salt or sugar dissolves in contact with water to form a uniform substance from which the components may be regained by evaporation the substance is called a solution. Gases too dissolve in liquids, while mixtures of various liquids show similar properties. Certain solids also consist of two or more components which are united so as to show similar effects. All these cases of solution are to be distinguished from chemical compounds on the one hand, and from simple mixtures on the other. When a substance contains its components in definite proportions which can only change, if at all, by sudden steps, it may be classed as a chemical compound. When the relative quantities of the components can vary continuously within certain limits, the substance is either a solution or a mixture. The distinction between these two classes is not sharp; though when the properties of the resultant are sensibly the sum of those of the pure components, as is nearly the case for a complex gas such as air, it is usual to class it as a mixture. When the properties of the resultant substance are different from those of the components and it is not a chemical compound we define it as a solution.

Historical.—Solutions were not distinguished from definite chemical compounds till John Dalton discovered the laws of definite and multiple proportions, but many earlier observations on the solubility of solids in water and the density of the resulting solutions had been made. As early as 1788 Sir Charles Blagden (1748–1820) made measurements of the freezing points of salt solutions, and showed that the depression of freezing point was roughly proportional to the amount of salt dissolved. About 1850 Thomas Graham published his famous experiments on diffusion, both with and without a separating membrane. In 1867 botanical investigations by M. Traube, and in 1877 others by W. Pfeffer, made known the phenomena of the osmotic pressure which is set up by the passage of solvent through a membrane impermeable to the dissolved substance or solute. The importance of these experiments from the physical point of view was recognized by J. H. van't Hoff in 1885, who showed that Pfeffer's results indicated that osmotic pressure of a dilute solution conformed to the well-known laws of gas pressure, and had the same absolute value as the same number of molecules would exert as a gas filling a space equal to the value of the solvent. The conception of a semi-permeable membrane, permeable to the solvent only, was used by van't Hoff as a means of applying the principles of thermodynamics to the theory of solution.

Another method of applying the same principles is due to J. Willard Gibbs, who considered the whole problem of physical and chemical equilibrium in papers published in 1877, though the application of his principles only began to make extensive progress about twenty years after the publication of his purely theoretical investigations. The phenomena of solution and of vapour pressure constitute cases of equilibrium, and conform to the laws deduced by Gibbs, which thus yield a valuable method of investigating and classifying the equilibria of solutions.

Solubility.—Some pairs of liquids are soluble in each other in all proportions, but, in general, when dealing with solutions of solids or gases in liquids, a definite limit is reached to the amount which will go into solution when the liquid is in contact with excess of the solid or gas. This limit depends on the nature of the two components, on the temperature and on the pressure. When the limit is reached the solution is said to be saturated, and the system is in equilibrium. If the solution of a solid more soluble when hot be cooled below the saturation point, the whole of the solid sometimes remains in solution. The liquid is then said to be supersaturated. But here the conditions are different owing to the absence of solid. If a crystal of the solid be added, the condition of supersaturation is destroyed, and the ordinary equilibrium of saturation is reached by precipitation of solid from solution.

The quantity of substance, or solute, which a given quantity of liquid or solvent will dissolve in presence of excess of the solute measures the solubility of the solute in the given solvent in the conditions of temperature and pressure. The solubilities of solids may be expressed in terms of the mass of solute which will dissolve in 100 grammes of water.

The following may be taken as examples:—

Solute.	Chemical Constitution of the Solid.	Solubility		
		at 0° C.	at 20° C.	at 100°C.
Sodium chloride	$NaCl$	35·7	36·0	39·8
Potassium nitrate	KNO_3	13·3	31·2	247·0
Barium chloride	$BaCl_2$	30·9	35·7	58·8
Copper sulphate	$CuSO_4$	15·5	22·0	73·5
Calcium carbonate	$CaCO_3$	0·0018	—	0·0018
Silver nitrate	$AgNO_3$	121·9	227·3 (at 19°·5)	1111·0 (at 110°)

When dealing with gases it is usually more convenient to express the solubility as the ratio of the volume of the gas absorbed to the volume of the absorbing liquid. For gases such as oxygen and nitrogen dissolved in water the solubility as thus defined is independent of the pressure, or the mass of gas dissolved is proportional to the pressure. This relation does not hold for very soluble gases, such as ammonia, at low temperatures. As a general rule gases are less soluble at high than at low temperatures—unlike the majority of solids. Thus oxygen, 4·89 volumes of which dissolve at atmospheric pressure in 1 volume of water at 0° C., only dissolves to the extent of 3·10 volumes at 20° and 1·70 volumes at 100°.

Cause of Solubility.—At the outset of the subject we are met by a fundamental problem, to which no complete answer can be given: Why do certain substances dissolve in certain other substances and not in different substances? Why are some pairs of liquids miscible in each other in all proportions, while other pairs do not mix at all, or only to a limited extent? No satisfactory correlation of solubility with chemical or other properties has been made. It is possible to state the conditions of solubility in terms of the theory of available energy, but the result comes to little more than a re-statement of the problem in other terms. Nevertheless, such a re-statement is in itself sometimes an advance in knowledge. It is certain then that when dissolution occurs the available energy of the whole system is decreased by the process, while when equilibrium is reached and the solution is saturated the available energy is a minimum. When a variable quantity is at a minimum a slight change in the system does not affect its value, and therefore, when a solution is saturated, the increase in the available energy of the liquid phase produced by dissolving in it some of the solid must be equal to the decrease in the available energy of the solid phase, caused by the abstraction from the bulk of that part dissolved. The general theory of such equilibria will be studied later under the head of the phase rule.

It is possible that a correlation may be made between solubility and the energy of surface tension. If a solid is immersed in a liquid a certain part of the energy of the system depends on, and is proportional to, the area of contact between solid and liquid. Similarly with two liquids like oil and water, which do not mix, we have surface energy proportional to the area of contact. Equilibrium requires that the available energy and therefore the area of contact should be a minimum, as is demonstrated in Plateau's beautiful experiment, where a large drop of oil is placed in a liquid of equal density and a perfect sphere is formed. If, however, the energy of surface tension between the two substances were negative the surface would tend to a maximum, and complete mixture would follow. From this point of view the natural solubility of two substances involves a negative energy of surface tension between them.

Gibbs's Phase Rule.—A saturated solution is a system in equilibrium, and exhibits the thermodynamic relations which hold for all such systems. Just as two electrified bodies are in equilibrium when their electric potentials are equal, so two parts of a chemical and physical system are in equilibrium when there is equality between the *chemical potentials* of each component present in the two parts. Thus water and steam are in equilibrium with each other when the chemical potential of water substance is the same in the liquid as in the vapour. The chemical potentials are clearly functions of the composition of the system, and of its temperature and pressure. It is usual to call each part of the system of uniform composition throughout a *phase*; in the example given, water substance, the only component is present in two phases—a liquid phase and a vapour phase, and when the potentials of the component are the same in each phase equilibrium exists.

If in unit mass of any phase we have n components instead of one we must know the amount of $n-1$ components present in that unit mass before we know the exact composition of it. Thus if in one gramme of a mixture of water, alcohol and salt we are told the amount of water and salt, we can tell the amount of alcohol. If, instead of one phase, we have r phases, we must find out the values of $r(n-1)$ quantities before we know the composition of the whole system. Thus, to investigate the composition of the system we must be able to calculate the value of $r\ (n-1)$ unknown quantities. To these must be added the external variables of temperature and pressure, and then as the total number of variables, we have $r\ (n+1)+2$.

To determine these variables we may form equations between the chemical potentials of the different components—quantities which are functions of the variables to be determined. If μ_1 and μ_2 denote the potentials of any one component in two phases in contact, when there is equilibrium, we know that $\mu_1=\mu_2$. If a third phase is in equilibrium with the other two we have also $\mu_1=\mu_3$. These two equations involve the third relation $\mu_2=\mu_3$, which therefore is not an independent equation. Hence with three phases we can form two independent equations for each component. With r phases we can form $r-1$ equations for each component, and with n components and r phases we obtain $n(r-1)$ equations.

Now by elementary algebra we know that if the number of independent equations be equal to the number of unknown quantities all the unknown quantities can be determined, and can possess each one value only. Thus we shall be able to specify the system completely when the number of variables, viz. $r\ (n-1)+2$, is equal to the number of equations, viz. $n(r-1)$; that is when $r=n+2$. Thus, when a system possesses two more phases than the number of its components, all the phases will be in equilibrium with each other at one definite composition, one definite temperature and one definite pressure, and in no other conditions. To take the simplest case of a one component system water substance has its three phases of solid ice, liquid water and gaseous vapour in equilibrium with each other at the freezing point of water under the pressure of its own vapour. If we attempt to change either the temperature or the pressure ice will melt, water will evaporate or vapour condense until one or other of the phases has vanished. We then have in equilibrium two phases only, and the temperature and pressure may change. Thus, if we supply heat to the mixture of ice, water and steam ice will melt and eventually vanish. We then have water and vapour in equilibrium, and, as more heat enters, the temperature rises and the vapour-pressure rises with it. But, if we fix arbitrarily the temperature the pressure of equilibrium can have one value only. Thus by fixing one variable we fix the state of the whole system. This condition is represented in the algebraic theory when we have one more unknown quantity than the number of equations; *i.e.* when $r(n-1)+2=n(r-1)+1$ or $r=n+1$, and the number of phases is one more than the number of components. Similarly if we have F more unknowns than we have equations to determine them, we must fix arbitrarily F co-ordinates before we fix the state of the whole system. The number F is called the *number of degrees of freedom* of the system, and is measured by the excess of the number of unknowns over the number of variables. Thus $F=r(n-1)+2-n(r-1)=n-r+2$, a result which was deduced by J. Willard Gibbs (1839–1903) and is known as Gibbs's Phase-Rule (see ENERGETICS).

The phenomena of equilibrium can be represented on diagrams. Thus, if we take our co-ordinates to represent pressure and temperature, the state of the systems with ice, water and vapour in equilibrium is represented by the point O where the pressure is that of the vapour of water at the freezing point and the temperature is the freezing point under that pressure. If all the ice be melted, we pass along the vapour pressure curve of water OA. If all the water be frozen, we have the vapour pressure curve of ice OB; while, if the pressure be raised, so that all the vapour vanishes, we get the curve OC of equilibrium between the pressure and the freezing point of water. The slope of these curves is determined by the so-called "latent heat equation"

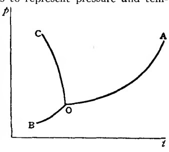


FIG. 1.

(see THERMODYNAMICS), $dp/dt=\lambda/t(v_2-v_1)$, where p and t denote the pressure and temperature, λ the heat required to change unit mass of the systems from one phase to the other, and v_2-v_1 the resulting change in volume. The phase rule combined with the latent heat equation contains the whole theory of chemical and physical equilibrium.

Application to Solutions.—In a system containing a solution we have to deal with two components at least. The simplest case is that of water and a salt, such as sodium chloride, which crystallizes without water. To obtain a non-variant system, we must assemble four phases—two more than the number of components. The four phases are (1) crystals of salt, (2) crystals of ice, (3) a saturated solution of the salt in water, and (4) the vapour, which is that practically of water alone, since the salt is non-volatile at the temperature in question. Equilibrium between these phases is obtained at the freezing point of the saturated solution under the pressure of the vapour. At that pressure and temperature the four phases can co-exist, and, as long as all of them are present, the pressure and temperature will remain steady. Thus a mixture of ice, salt and the saturated solution has a constant freezing point, and the composition of the solution is constant and the same as that of the mixed solids which freeze out on the abstraction of heat. This constancy both in freezing point and composition formerly was considered as a characteristic of a pure chemical compound, and hence these mixtures were described as components and given the name of "cryohydrates."

In representing on a diagram the phenomena of equilibrium in a two-component system we require a third axis along which to plot the composition of a variable phase. It is usual to take three axes at right angles to each other to represent pressure, temperature and the composition of the variable phase. On a plane figure this solid diagram must be drawn in perspective, the third axis C being imagined to lie out of the plane of the paper. The phase-rule diagram that we construct is then a sketch of a solid model, the lines of which do not really lie in the plane of the paper.

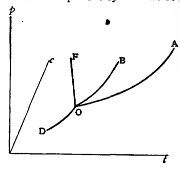

FIG. 2.

Let us return to the case of the system of salt and water. At the cryohydric point O we have four phases in equilibrium at a definite pressure, temperature and composition of the liquid phase. The condition of the system is represented by a single point on the diagram. If heat be added to the mixture ice will melt and salt dissolve in the water so formed. If the supply of ice fails first the temperature will rise, and, since solid salt remains, we pass along a curve OA giving the relation between temperature and the vapour pressure of the saturated solution. If, on the other hand, the salt of the cryohydrate fails before the ice the water given by the continued fusion dilutes the solution, and we pass along the curve OB which shows the freezing points of a series of solutions of constantly increasing dilution. If the process be continued till a very large quantity of ice be melted the resulting solution is so dilute that its freezing point B is identical with that of the pure solvent. Again, starting from O, by the abstraction of heat we can remove all the liquid and travel along the curve OD of equilibrium between the two solids (salt and ice) and the vapour. Or, by increasing the pressure, we eliminate the vapour and obtain the curve OF giving the relation between pressure, freezing point and composition when a saturated solution is in contact with ice and salt.

If the salt crystallizes with a certain amount of water as well as with none, we get a second point of equilibrium between four phases. Sodium sulphate, for instance, crystallizes below 32·6° as $Na_2SO_4\cdot 10H_2O$, and above that temperature as the anhydrous solid Na_2SO_4. Taking the point O to denote the state of equilibrium between ice, hydrate, saturated solution and vapour, we pass along OA till a new solid phase, that of Na_2SO_4, appears at 32·6°; from this point arise four curves, analogous to those diverging from the point O.

For the quantitative study of such systems in detail it is convenient to draw plane diagrams which are theoretically projections of the curves of the solid phase rule diagram on one or other of these planes. Experiments on the relation between temperature and concentration are illustrated by projecting the curve OA of fig. 2 on the tc-plane. The pressure at each point should be that of the vapour, but since the solubility of a solid does not change much with pressure, measurements under the constant atmospheric pressure give a curve practically identical with the theoretical one.

Fig. 3 gives the equilibrium between sodium sulphate and water in this way. B is the freezing point of pure water, O that

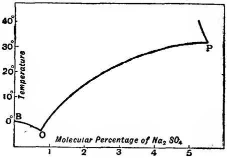

FIG. 3.

of a saturated solution of $Na_2SO_4\cdot 10H_2O$. The curve OP represents the varying solubility of the hydrate as the temperature rises from the cryohydric point to 32·6°. At that temperature crystals of the anhydrous Na_2SO_4 appear, and a new fixed equilibrium exists between the four phases—hydrate, anhydrous salt, solution and vapour. As heat is supplied, the hydrate is transformed gradually into the anhydrous salt and water. When this process is complete the temperature rises, and we pass along a new curve giving the equilibrium between anhydrous crystals, solution and vapour. In this particular case the solubility decreases with rise of temperature. This behaviour is exceptional.

Two Liquid Components.—The more complete phenomena of mutual solubility are illustrated by the case of phenol and water.

In fig. 4 A represents the freezing point of pure water, and AB the freezing point curve showing the depression of the freezing point as phenol is added. At B is a non-variant system made up of ice, solid phenol, saturated solution and vapour. BCD is the solubility curve of phenol in water. At C a new liquid phase appears—the solution of water in liquid phenol, the solubility of which is represented by the curve DE. At D the composition of the two liquids becomes identical, and at temperatures above D, 68°C the liquids are soluble in each other in all proportions, and only one liquid phase can exist. If the two substances are soluble in each other in all proportions at all temperatures above their melting points we get a diagram reduced to the two fusion curves cutting each other at a non-variant point. This behaviour is illustrated by the case of silver and copper (fig. 5). At the non-variant point the two metals freeze out together and the composition of the liquid is the same as that of the mixed solid which crystallizes from it. The solid is then known as a eutectic alloy.

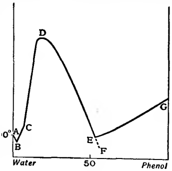

FIG. 4.

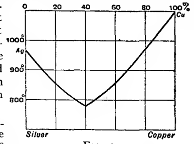

FIG. 5.

A liquid in which the composition is nearly that of the eutectic shows the changes in the rate of fall of temperature as it is allowed to cool. First a small quantity of one of the pure components begins to crystallize out, and the rate of cooling is thereby diminished owing to the latent heat liberated by the change of state. This process continues till the composition of the liquid phase reaches that of the eutectic, when the whole mass solidifies on the further loss of heat without change of temperature, giving a very definite freezing point. The process of cooling is thus represented by a path which runs vertically downwards till it cuts the freezing point curve, and then travels along it till the non-variant point is reached. In this way two temperature points are obtained in the investigation—the higher giving a point on the equilibrium curve, the lower showing the non-variant point.

Other pairs of alloys, showing more complicated relations, are described in ALLOY. Experiments on alloys are, in some ways, easier to make than on pairs of non-metallic substances, partly owing to the possibility of polishing sections for microscopic examination, and the investigation of alloys has done much to elucidate the general phenomena of solution, of which metallic solution constitutes a special case.

When the two components form chemical compounds with each other, the phenomena of mutual solubility become more complex. For a simple case to serve as an introduction, let us again turn to alloys. Copper and antimony form a single compound $SbCu_2$. If either copper or antimony be added to this compound, the freezing point is lowered just as it would be if a new substance were added to a solvent. Thus on each side of the point B representing this compound, the curve falls. Proceeding along the curve in either direction, we come to a non-variant or eutectic point. In one case (represented by the point A in the figure) the solid which freezes out is a conglomerate of crystals of the compound with those of antimony, in the other case C with those of copper. Thus in interpreting complicated freezing point curves, we must look for chemical compounds where the curve shows a maximum, and for a eutectic or cryohydrate where two curves meet at a minimum point.

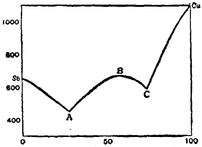

FIG. 6.

We are now ready to study a case where several compounds are formed between the two components. A good example is the equilibrium of ferric chloride and water, studied by B. Roozeboom. The experimental curve of solubility is shown in fig. 7. At A we have the freezing point of pure water, which is lowered by the gradual addition of ferric chloride in the manner shown by the curve AB. At B we have the non-variant cryohydric point at which ice, the hydrate $Fe_2Cl_6 \cdot 12H_2O$, the saturated solution and the vapour are in equilibrium at 55° C. As the proportion of salt is increased, the melting point of the conglomerate rises, till, at the maximum point C, we have the pure compound the hydrate with twelve molecules of water. Beyond C, the addition of salt lowers the melting point again, till at D we obtain another non-variant point. This indicates the appearance of a new compound, which should exist pure at E, the next maximum, and, led by these considerations, Roozeboom discovered and isolated a previously unknown hydrate, $Fe_2Cl_6 \cdot 7H_2O$. In a similar way the curve FGH, between 30° and 55°, shows the effect of the hydrate $Fe_2Cl_6 \cdot 5H_2O$, and the curve HJK that of the hydrate $Fe_2Cl_6 \cdot 4H_2O$, which, when pure, melts at 73·5°—the point J on the diagram. At the point K, 66°, begins the solubility curve of the anhydrous salt, Fe_2Cl_6, the fusion point of which when pure is beyond the limits of the diagram. Let us now trace the behaviour of a solution of ferric chloride which is evaporated to dryness at a constant temperature of 31°. The phenomena may be investigated by following a horizontal line across the diagram. When the curve BC is reached, $Fe_2Cl_6 \cdot 12H_2O$ separates out, and the solution solidifies. Further renewal of water will cause first liquefaction, as the curve CD is passed, and then resolidification to $Fe_2Cl_6 \cdot 7H_2O$ when DE is cut. Again the solid will liquefy and once more become solid as $Fe_2Cl_6 \cdot 5H_2O$. Still further evaporation causes these crystals to effloresce and pass into the anhydrous salt. As we have seen, the maxima of the various curve-branches at C, E, G, and J correspond with the melting points of the various hydrates at 37°, 32·5°, 56° and 73·5° respectively; and at these points melting or solidification of the whole mass can occur at constant temperature. But we have also found this behaviour to be characteristic of the non-variant or transition points, which, in this case, are represented by the points B, D, F, H and K (−55°, 27·4°, 30°, 55° and 66°). Thus in two ways at least a constant melting point can be obtained in a two-component system.

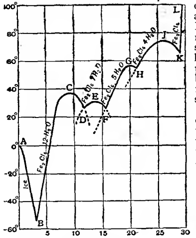

FIG. 7.

Solid Solutions.—In all the cases hitherto considered, the liquid phase alone has been capable of continuous variation in composition. The solid phases each have been of one definite substance. Crystals of ice may lie side by side with crystals of common salt, but each crystalline individual is either ice or salt; no one crystal contains both components in proportions which can be varied continuously. But, in other cases, crystals are known in which both components may enter. Such phenomena are well known in the alums—double sulphates of aluminium with another metal. Here the other metal may be one, such as potassium, or two, such as potassium and sodium, and, in the latter case, the proportion between the two may vary continuously throughout wide limits. Such structures are known as mixed crystals or solid solutions.

The theoretical form of the freezing point diagrams when solid solutions are present depends on the relation between the available energy and the composition in the two phases. This relation is known when the amount of either component present in the other is very small, for it is then the relation for a dilute system and can be calculated. But at intermediate compositions we can only guess at the form of the energy-composition curve, and the freezing point composition curve, deduced from it, will vary according to the supposition which we make. With the most likely forms for the energy curves we get the accompanying diagrams for the relation between freezing point and concentration.

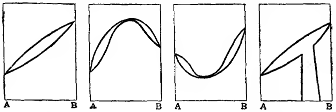

FIG. 8. FIG. 9. FIG. 10. FIG. 11.

It will be noticed that in all these theoretical curves the points of initial fusion and solidification do not in general coincide; we reach a different curve first according as we approach the diagram from below, where all is solid, or from above, where all is liquid. Again, it will be seen that the addition of a small quantity of one component, say B, to the other, A, does not necessarily lower the melting point, as it does with systems with no solid solutions; it is quite as likely to cause it to rise. The second and third figures, too, show that the presence of solid solutions may simulate the phenomena of chemical combination, where the curve reaches a maximum, and of non-variant systems where we get a minimum. The fourth figure shows that, in some cases, it should be possible for solid solutions to be present in a limited part of the field only, being absent between the two nearly vertical lines in fig. 11. Experiment has revealed the existence of systems in which these phenomena are displayed. As an example we may take the case of mixtures of naphthalene and β-naphthol, substances which form solid solutions in each other. The freezing and melting point curves are exactly similar to theoretical curves of fig. 8, the point A representing pure naphthalene and B pure β-naphthol. When the equilibria become more complex difficulties of interpretation of the experimental results often arise. It is often very difficult to distinguish between a chemical compound, for example, and the case of solid solution represented by fig. 9. All available evidence, from the freezing point curve and from other sources must be scrutinized before an opinion is pronounced. But the elucidation of the complicated phenomena of solid solutions would have been impossible without the theoretical knowledge deduced from the principle of available energy.

Supersaturation.—When a crystal of the solid phase is present the equilibrium of a solution is given by the solubility curves we have studied. If, however, a solution be cooled slowly past its saturation point with no solid present, crystallization does not occur till some lower temperature is reached. Between the saturation point and this lower temperature, the liquid holds in solution more of the solute than corresponds with equilibrium, and is said to be supersaturated. A familiar example is to be found in solutions of sodium sulphate, which may be cooled much below their saturation point and kept in the liquid state till a crystal of the hydrate $Na_2SO_4 \cdot 10H_2O$ is dropped in, when solidification occurs with a large evolution of latent heat. These phenomena are explicable if we consider the energy relations, for the intrinsic energy of a system will contain terms depending on the area of contact between different phases, and, for a given mass of material, the area will be greater if the substance is finely divided. Hence the conditions necessary to secure equilibrium when the solid phase is present are not the same as those necessary to cause crystallization to start in a number of crystals at first excessively minute in size. The corresponding phenomenon in the case of vapours is well known. Dust-free air will remain supersaturated with water-vapour in conditions where a dense cloud would be formed in presence of solid dust-nuclei or electric ions which serve the same purpose.

If a solution of a salt be stirred as it cools in an open vessel, a thin shower of crystals appears at or about the saturation temperature. These crystals grow steadily, but do not increase in number. When the temperature has fallen about 10° C. below this point of saturation, a dense shower of new crystals appear suddenly. This shower may be dense enough to make the liquid quite opaque. These phenomena have been studied by H. A. Miers and Miss F. Isaac. If the solution be confined in a sealed glass tube, the first thin shower is not formed, and the system remains liquid till the secondary dense shower comes down. From this and other evidence it has been shown that the first thin shower in open vessels is produced by the accidental presence of tiny crystals obtained from the dust of the air, while the second dense shower marks the point of spontaneous crystallization, where the decrease in total available energy caused by solidification becomes greater than the increase due to the large surface of contact between the liquid and the potentially existing multitudinous small crystals of the shower.

If the temperature at which this dense spontaneous shower of crystals is found be determined for different concentrations of solution, we can plot a "supersolubility curve," which is found generally to run roughly parallel to the "solubility curve" of steady equilibrium between liquid and already existing solid. When two substances are soluble in each other in all proportions, we get solubility curves like those of copper and silver shown in fig. 5. We should expect to find supersolubility curves lying below the solubility curves, and this result has been realized experimentally for the supersolubility curves of mixtures of salol (phenyl salicylate) and betol (β-naphthol salicylate) represented by the dotted lines of fig. 12.

In practical cases of crystallization in nature, it is probable that these phenomena of supersaturation often occur. If a liquid mixture of A and B (fig. 12) were inoculated with crystals of A when its composition was that represented by x, cooled very slowly and stirred, the conditions would be those of equilibrium throughout. When the temperature sank to a, on the freezing point curve, crystals of pure A would appear. The residual liquid would thus become richer in B, and the temperature and composition would pass along the curve till E, the eutectic point, was reached. The liquid then becomes saturated with B also, and, if inoculated with B crystals, will deposit B alongside of A, till the whole mass is solid. But, if no solid be present initially, or if the cooling be rapid, the liquid of composition x becomes supersaturated and may cool till the supersaturation curve is reached at b, and a cloud of A crystals comes down. The temperature may then rise and the concentration of B increase in the liquid in a manner represented by some such line as $b\ f$. The conditions may then remain those of equilibrium along the curve f E, but before reaching f the solution may become supersaturated with B and deposit B crystals spontaneously. The eutectic point may never be reached. The possibility of these phenomena should be borne in mind when attempts are made to interpret the structure of crystalline bodies in terms of the theory of equilibrium.

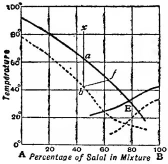

FIG. 12.

Osmotic Pressure.—The phase rule combined with the latent heat equation enables us to trace the general phenomena of equilibrium in solutions, and to elucidate and classify cases even of great complexity. But other relations between the different properties of solutions have been investigated by another series of conceptions which we shall proceed to develop. Some botanical experiments made about 1870 suggested the idea of semi-permeable membranes, *i.e.* membranes which allow a solvent to pass freely but are impervious to a solute when dissolved in that solvent. It was found, for instance, that a film of insoluble copper ferrocyanide, deposited in the walls of a porous vessel by the inward diffusion and meeting of solutions of copper sulphate and potassium ferrocyanide, would allow water to pass, but retained sugar dissolved in that liquid. It was found, too, when water was placed on one side of such a membrane, and a sugar solution in a confined space on the other, that water entered the solution till a certain pressure was set up when equilibrium resulted.

The importance of these experiments from the point of view of the theory of solution, lay in the fact that they suggested the conception of a perfect or ideal semi-permeable partition, and that of an equilibrium pressure representing the excess of hydrostatic pressure required to keep a solution in equilibrium with its pure solvent through such a partition. Artificial membranes are seldom or never perfectly semi-permeable—some leakage of solute nearly always occurs, but the imperfections of actual membranes need no more prevent our use of the ideal conception than the faults of real engines invalidate the theory of ideal thermodynamics founded on the conception of a perfect, reversible, frictionless, heat engine. Further, in the free surface the solutions of an involatile solute in a volatile solvent, through which surface the vapour of the solvent alone can pass, and in the boundary of a crystal of pure ice in a solution, we have actual surfaces which are in effect perfectly semi-permeable. Thus the results of our investigations based on ideal conceptions are applicable to the real phenomena of evaporation and freezing.

Dilute Solutions.—Before considering the more complicated case of a concentrated solution, we will deal with one which is very dilute, when the theoretical relations are much simplified. The vapour pressure of a solution may be measured experimentally by two methods. It may be compared directly with that of the pure solvent, as the vapour-pressure of a pure liquid is determined, by placing solvent and solution respectively above the mercury in two barometer tubes, and comparing the depressions of the mercury with the height of a dry barometer at the same temperature. This method was used by Raoult. On the other hand, a current of dry air may be passed through the series of weighed bulbs containing solution and solvent respectively, and the loss in weight of each determined. The loss in the solution bulbs gives the mass of solvent absorbed from the solution, and the loss in the solvent bulbs the additional mass required to raise the vapour pressure in the air-current to equilibrium with the pure solvent. The relative lowering of vapour pressure of the solution compared with that of the solvent is measured by the ratio of the extra mass absorbed from the solvent bulbs to the total mass absorbed from both series of bulbs. Experiments by this method have been made by W. Ostwald and J. Walker, and by Lord Berkeley and E. G. J. Hartley.

Vapour Pressure.

The vapour pressure of the solution of a non-volatile solute is less than the vapour pressure of the pure solvent. Hence if two vessels, one filled with solvent and one with solution, be placed side by side in an exhausted chamber, vapour will evaporate from the solvent and condense on the solution. The solution will thus gain solvent, and will grow more and more dilute. Its volume will also increase, and thus its upper surface will rise in the vessel. But as we ascend in an atmosphere the pressure diminishes; hence the pressure of the vapour in the chamber is less the higher we go, and thus eventually we reach a state of equilibrium where the column of vapour is in equilibrium at the appropriate level both with solvent and solution. Neglecting the very small buoyancy of the vapour, the hydrostatic pressure P at the foot of the column of solution is $h\ g\ \rho$ where h is the height of the column and ρ the mean density of the solution. If the height be not too great, we may assume the density of the vapour to be uniform, and write the difference in vapour pressure at the surfaces of the solvent and of the solution as $p-p'=hg\sigma$. Hence we find that $p-p'=\mathrm{P}\sigma/\rho$ for a very dilute solution, where the difference $p-p'$ is small and the height of the balancing column of solution small.

In practice the time required to reach these various conditions of equilibrium would be too great for experimental demonstration, but the theoretical consideration of vapour pressures is of fundamental importance. Let us suppose that we possess a partition such as that described above, which is permeable to the solvent but not to the solute when dissolved in it, and let us connect the solution and solvent of fig. 13 with each other through such a partition. If solvent were to flow one way or the other through the partition, the height of the column of solution would rise or fall and the equilibrium with the vapour be disturbed. A continual circulation might thus be set up in an isothermal enclosure and maintained with the performance of an unlimited supply of work. This result would be contrary to all experience of the impossibility of " perpetual motion," and hence we may conclude that through such a semi-permeable wall, the solvent and the solution at the foot of the column would

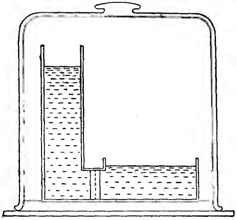

FIG. 13.

be in equilibrium under the excess of hydrostatic pressure represented when the solution is very dilute by $P=(p-p^1)\rho/\sigma$. But such a pressure represents the equilibrium osmotic pressure discussed above. Therefore the equilibrium osmotic pressure of a solution is connected with the vapour pressure, and, in a very dilute solution, is expressed by the simple relation just given.

Another relation becomes evident if we use as a semi-permeable partition a " vapour sieve " as suggested by G. F. Fitzgerald. If a number of small enough holes be drilled through a solid substance which is not wetted by the liquid, our knowledge of the phenomena of capillarity shows us that it needs pressure to force the liquid into the holes. A piston made of such a perforated substance, therefore, may be used to exert pressure on the liquid, while all the time the vapour is able to pass. By evaporation and condensation, then, the solvent can pass through this perforated partition, which thus acts as a perfect semi-permeable membrane. When the solution and solvent are in equilibrium across the partition, the vapour pressure of the solution has been increased by the application of pressure till it is equal to that of the solvent. In any solution, then, the osmotic pressure represents the excess of hydrostatic pressure which it is necessary to apply to the solution in order to increase its vapour pressure to an equality with that of the solvent in the given conditions.

Similar considerations show that, since at its freezing point the vapour pressure of a solution must be in equilibrium with that of ice, the depression of freezing point produced by dissolving a substance in water can be calculated from a knowledge of the vapour pressure of ice and water below the freezing point of pure water. But another method of investigation will illustrate new ways of treating our subject.

Freezing Point.

By imagining that a dilute solution is put through a thermodynamic cycle we may deduce directly relations between its osmotic pressure and its freezing point. Let us freeze out unit mass of solvent from a solution at its freezing point $T-dT$ and remove the ice, which is assumed to be the ice of the pure solvent. Then let us heat both ice and solution through the infinitesimal temperature range dT to the freezing point T of the solvent, melt the ice by the application of an amount of heat L, which measures its latent heat of fusion, and allow the solvent so formed to enter the solution reversibly through a semi-permeable wall into an engine cylinder, doing an amount of work Pdv. By cooling the resultant solution through the range dT we recover the original state of the system. The well-known expression for the efficiency of the cycle of reversible operation gives us

$$Pdv/L = dT/T \text{ or } dT = TPdv/L$$

as a value for the depression of the freezing point of the solution compared with that of the pure solvent.

The freezing point of a solution may be determined experimentally. The solution is contained in an inner tube, surrounding which is an air space. Then comes an outer vessel, in which a freezing mixture can be placed. This solution is stirred continuously and the temperature falls slowly below the freezing point, till the supersaturation point is reached, or until a crystal of ice is introduced. The solution then freezes, until the heat liberated is enough to raise the temperature to the point of equilibrium given by the tendency of the solution taken in contact with ice to approach the true freezing point on one side and the temperature of the enclosure on the other. To get the true freezing point then, it is well to arrange that the temperature of the enclosure should finally be nearly that of the freezing point to be observed. One way in which this has been secured is by obtaining the under cooling by temporary cooling of the air space by a spiral tube in which ether may be evaporated, the outer vessel being filled with ice in contact with a solution of equivalent concentration to that within. Modifications of this method have been used by many observers, among others by Raoult, Loomis, H. C. Jones, and by E. H. Griffiths and T. G. Bedford, who compared directly the freezing points of dilute solutions with those of the pure solvent in similar conditions by the accurate methods of platinum thermometry.

Absolute Value of Osmotic Pressure.

Another application of the theory of energy enables us to coordinate the osmotic pressure of a dilute solution with the pressure of a gas occupying the same space. On the fundamental hypotheses of the molecular theory, we must regard a solution as composed of a number of separate particles of solute, scattered throughout the solvent. Each particle may react in some way on the solvent in its neighbourhood, but if the solution be so dilute that each of these spheres of influence is unaffected by the rest, no further addition of solvent will change the connexion between one particle of solute and its associated solvent. The only effect of adding solvent will be to separate further from each other the systems composed of solute particle as nucleus and solvent as atmosphere; it will not affect the action of each nucleus on its atmosphere. Thus the result will be the same whatever the nature of the interaction may be. If solvent be allowed to enter through a semi-permeable wall into an engine cylinder, the work done when the solution within is already dilute will be the same whatever the nature of the interaction between solute and solvent, that is, whatever be the nature of the solvent itself. It will even be the same in those cases where, with a volatile solute, the presence of a solvent may be dispensed with, and the solute exist in the same volume as a gas. Now the work done by allowing a small quantity of solvent to enter reversibly into an osmotic cylinder is measured by the product of the osmotic pressure into the change in volume. Hence the osmotic pressure is measured by the work done per unit change of volume of the solution. The result of our consideration, therefore, is that the osmotic pressure of a dilute solution of a volatile solute must have the same value as the gaseous pressure the same number of solute particles would exert if they occupied as gas a volume equal to that of the solution.

The reasoning given above is independent of the temperature, so that the variation with temperature of the osmotic pressure of a dilute solution must be the same as that of a gas, while Boyle's law must equally apply to both systems. Experimental evidence confirms these results, and extends them to the cases of non-volatile solutes—as is, indeed, to be expected, since volatility is merely a matter of degree. When the solution ceases to be dilute in the thermodynamic sense of the word, that is, when the spheres of influence of the solute particles intersect each other, this reasoning ceases to apply, and the resulting modification of the gas laws as applied to solutions becomes a matter for further investigation, theoretical or experimental. In the limit then, when the concentration of the solution becomes vanishingly small, theory shows that the osmotic pressure is equal to the pressure of a gas filling the same space. Experiments with membranes of copper ferrocyanide have verified this result for solutions of cane-sugar of moderate dilutions. But the most accurate test of the theory depends on measurements of freezing points.

A quantity of gas measured by its molecular weight in grammes when confined in a volume of one litre exerts a pressure of 22·2 atmospheres, and thus the osmotic pressure of a dilute solution divided by its concentration in gramme-molecules per litre has a corresponding value. But we have seen that the depression of dT of the freezing point of a dilute solution is measured by $TPdv/L$. Putting the absolute temperature of the freezing point of water as 273°, the osmotic pressure P as 22·2 atmospheres or $22{\cdot}4\times10^6$, C.G.S. units per unit concentration, L the latent heat as $79{\cdot}4\times4{\cdot}184\times10^7$ in the corresponding units, and dv the volume change in the solution for unit mass of solvent added we get for the quantity dT/c, where c is the concentration of the solution, the value 1·857° C. per unit concentration. Experimental measurements of freezing points of various non-electrolytic solutions have been made by Raoult, Loomis, Griffiths, Bedford and others and numbers ranging round 1·85 found for this concentration. Equally good comparisons have been obtained for solutions in other solvents such as acetic acid 3·88, formic acid 2·84, benzene 5·30, and nitrobenzene 6·95. Such a concordance between theory and experiment not only verifies the accuracy of thermodynamic reasoning as applied to dilute solutions, but gives perhaps one of the most convincing experimental verifications of the general validity of thermodynamic theory which we possess.

Another verification may be obtained from the phenomena of vapour pressure. Since, in dilute solutions, the osmotic pressure has the gas value, we may apply the gas equation $PV=nRT=npv_1$ to osmotic relations. Here n is the number of gramme-molecules of solute, T the absolute temperature, R the gas constant with its usual "gas" value, p the vapour pressure of the solvent and v_1 the volume in which one gramme-molecule of the vapour is confined.

In the vapour pressure equation $p-p'=P\sigma/\rho$, we have the vapour density σ equal to M/v_1, where M is the molecular weight of the solvent. The density of the liquid is MN/V, where N is the number of solvent molecules, and V the total volume of the liquid. Substituting these values, we find that the relative lowering of vapour pressure in a very dilute solution is equal to the ratio of the numbers of solute and solvent molecules, or $(p-p')/p=n/N$.

The experiments of Raoult on solutions of organic bodies in water and on solutions of many substances in some dozen organic solvents have confirmed this result, and therefore the theoretical value of the osmotic pressure from which it was deduced.

Although even good membranes of copper ferrocyanide are rarely perfectly semi-permeable, and in other membranes such as india-rubber, &c., which have been used, the defects from the theoretical values of the equilibrium pressure are very great, yet, in the light of the exact verification of theory given by the experiments described above, it is evident that such failures to reach the limiting value in no wise invalidate the theory of osmotic equilibrium. They merely show that, in the conditions of the particular experiments, the thermodynamic equilibrium value of the osmotic pressure cannot be reached—the thermodynamic or theoretical osmotic pressure (which must be independent of the nature of the membrane provided it is truly semi-permeable) is a different thing from the equilibrium pressure actually reached in a given experiment, which measures the balance of ingress and egress of solvent through an imperfect semi-permeable membrane.

Solutions of Electrolytes.

Dilute solutions of substances such as cane-sugar, as we have seen, give experimental values for the connected osmotic properties—pressure, freezing point and vapour pressure—in conformity with the theoretical values. All these solutions are non-conductors of electricity. On the other hand, solution of mineral acids and salts conduct the current with chemical decomposition—they are called electrolytes. In order to explain the electrical properties of a solution, for instance of potassium chloride, we are driven to believe that each molecule of the salt is dissociated into two parts, potassium and chlorine, each associated with an electric charge equal in amount but opposite in sign. The movement in opposite directions of these charged ions constitutes the electric current in the solution. To explain the electrical properties of sulphuric acid in aqueous solution, the supposition of three ions, two of hydrogen and one of the chemical group SO_4, is necessary. Now measurements of osmotic properties of these solutions show that their osmotic pressures are abnormally great and that, at extreme dilution, the ratio of their osmotic pressures to that of equivalent solutions of non-electrolytes is equal to the number of ions indicated by the electrolytic properties. From the osmotic side also, then, electrolytic dissociation is indicated, and indeed, it was from this side that the idea was first suggested by S. Arrhenius in 1887. The subject is dealt with in ELECTROLYSIS and CONDUCTION, ELECTRIC: § *II. Liquids*.

Concentrated Solutions.—Having dealt with the relations between the properties of an ideally dilute solution, we now turn to the consideration of the general case where the simplifying assumption of great dilution is not made.

The height of the column of solution in fig. 13 required for osmotic equilibrium through a semi-permeable wall below is now very great, since the osmotic pressure of strong solutions may reach many hundred atmospheres. Hence we must not assume that the density of the vapour in the surrounding atmosphere is constant, or that the solution, when equilibrium is reached, is of uniform concentration throughout. The osmotic pressure (defined as the difference in the hydrostatic pressures of the solution and solvent when their vapour pressures are equal and they are consequently in equilibrium through a perfect semi-permeable membrane) may also depend on the absolute values of the hydrostatic pressures, as may the vapour pressure of the liquids.

Vapour Pressure.

To investigate the osmotic pressure of a strong solution we may consider the hydrostatic pressure required to increase its vapour pressure to an equality with that of the solvent. The relation between hydrostatic pressure and the vapour pressure of a pure liquid may be obtained at once by considering the rise of liquid in a capillary tube. The difference in vapour pressure at the top and at the bottom of the column is $p-p'=P\sigma/\rho$, as shown above for a column of solution. Writing v for $1/\sigma$, the specific volume of the vapour at the pressure p, and V for $1/\rho$, the specific volume of the liquid at the pressure P, and restricting the result to small changes, we get $vdp=VdP$.

In considering the corresponding relation for a solution instead of a pure liquid, possible differences in concentration make the column method difficult of application, and it is better to attach the problem by means of an imaginary cycle of isothermal operation. The simplest way to do this is to imagine a vapour-sieve piston through which the vapour but not the liquid can pass. As we have explained above, such a vapour sieve may be constructed by boring a number of small enough holes through a solid not wetted by the liquid.

Let us imagine unit mass of solution of volume V confined in a cylinder ABC between a fixed vapour sieve B and a solid piston A

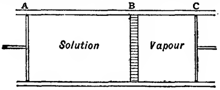

FIG. 14.

by which a pressure P is applied. The vapour at pressure p in equilibrium with the liquid is bounded by a solid piston C, which we can also move to change the pressure or volume.

With such an imaginary apparatus, H. L. Callendar has shown that the variation of vapour pressure of a solution with pressure is given by the expression $V'dP=vdp$, where V' is the change in volume of the solution when unit mass of solvent is mixed with it. The corresponding relation for a pure liquid can be regained by considering that at infinite dilution the liquid becomes pure solvent, and the change of volume becomes equal to the volume V of solvent added.

The osmotic pressure P_0 is the difference of the hydrostatic pressures P' and P of the solution and the solvent when their vapour pressures are equal. Hence $dP_0=dP'-dP$ and $dP_0/dP=(V-V')/V'$ or $dP_0/dP'=(V-V')/V$. If $V=V'$ there is no change in osmotic pressure with hydrostatic pressure, and osmotic pressure depends on concentration and temperature only.

The relation between the equilibrium pressures P and P' for solution and solvent corresponding to the same value p_0 of the vapour pressure is obtained by integrating the equation $V'dP'=vdp$ between corresponding limits for solution and solvent. We get

$$\int_{p'}^{P'} V'dP' = \int_{p'}^{p_0} vdp \text{ and } \int_{p}^{P} VdP = \int_{p}^{p_0} vdp,$$

whence
$$\int_{p'}^{P'} V'dP' - \int_{p}^{P} VdP = \int_{p'}^{p} vdp,$$

where p and p' are the vapour pressures of solvent and solution each under its own vapour pressure only.

If we measure the osmotic pressure P_0 when the solvent is under its own vapour pressure only, that is, when $P=p=p_0$, the term involving V vanishes, and the limit of integration P' becomes P_0+p. If we assume that V', the volume change on dilution, varies regularly or not appreciably with pressure, we may write the first integral as $V'(P_0+p-p')$ where V' now denotes its mean value between the limits.

To evaluate the second integrals vdp we may subtract a constant b to represent the defect of the volume of the vapour from the ideal volume Rt/p. This gives

$$V'(P_0+p-p')=Rt\log(p/p')-b(p-p').$$

For most experimental purposes the small terms involving the factor $(p-p')$ may be neglected, and we have, approximately,

$$P_0V'=Rt\log(p/p').$$

From this equation the osmotic pressure P_0 required to keep a solution in equilibrium as regards its vapour and through a semi-permeable membrane with its solvent, when that solvent is under its own vapour pressure, may be calculated from the results of observations on vapour pressure of solvent and solution at ordinary low hydrostatic pressures. The chief difficulty lies in the determination of the quantity V′, the change in volume of the solution under the pressure P_0 when unit mass of solvent is mixed with it. This determination involves a knowledge of the density and of the compressibility of the solution; the latter property is difficult to measure accurately.

In some solutions such as those of sugar the change in volume on dilution is nearly equal to the volume of solvent added; V′ then becomes equal to V, the specific volume of the solvent. The osmotic pressures of strong sugar solutions were measured successfully by a direct method with semi-permeable membranes of copper ferrocyanide by Lord Berkeley and E. G. J. Hartley, who also determined the vapour pressures by passing a current of air successively through weighed vessels containing solution and water respectively.

Their table of comparison published in 1906 shows the following agreement:—

Concentration in grammes per litre of solution.	Osmotic pressure at 0° C. in atmospheres.	
	From vapour pressures.	From direct measurement.
420	44·3 (at 12·6°)	43·97
540	69·4	67·51
660	101·9	100·78
750	136·0	133·74

It seems likely that measurements of vapour pressure and compressibility may eventually enable us to determine accurately osmotic pressures in cases where direct measurement is impossible.

Freezing Point.—Solutions. The slope of the temperature vapour pressure curves in the neighbourhood of the freezing point of the solvent is given by the latest heat equation. The difference in the two slopes for water and ice is $dp/dT - dp'/dT = L/Tv$, where L, the latent heat of fusion, is the difference between the heats of evaporation for ice and water, and v is the specific volume of the vapour.

The difference in the lowering of vapour pressures $dp-dp'$ may be put equal to VdP/v, where P is the osmotic pressure, and V the specific volume of the solvent. We then get $VdP = LdT/T$.

In order to integrate this expression we need to know L and v as functions of the temperature and pressure. The latent heat L at any temperature is given by $L = L_0 - \int_{\theta_0}^{\theta}(s-s')dT$, where L_0 is value at T_0 and $s-s'$ is the difference in the specific heats of water and ice. The probable error in neglecting any variation of specific heat is small, and we may calculate L from the values of $L_0-(s-s')(T_0-T)$, where $s-s'$ is about 0·5 calories. The variation of L with pressure is probably small.

The volume of a gramme of water also depends on temperature and pressure. Approximately one degree lowering of freezing point corresponds with a change of 12 atmospheres in the osmotic pressure. From the known coefficients of compressibility and thermal expansion we find that V may be represented by the linear equation $V = 1{\cdot}000 + 0{\cdot}0008\ \Delta$, where Δ is the lowering of the freezing point below 0°.

Putting in these values and integrating we have, neglecting terms involving Δ^3, $P = 12{\cdot}06\ \Delta - 0{\cdot}021\ \Delta^2$ where P is the osmotic pressure in atmospheres.

H. W. Morse and J. C. W. Frazer, who have made direct measurements of osmotic pressure of solution of cane-sugar, have also measured the freezing points of corresponding solutions. From these results the equation just given has been examined by G. N. Lewis.

Concentration in gramme-molecules per litre of water.	Depression of the freezing point = Δ.	Osmotic pressure.	
		Calculated from Δ.	Observed.
0·1	0·195	2·35	2·44
0·5	0·985	11·8	11·8
1·0	2·07	24·9	24·8

Thus the theory of the connexion of osmotic pressure with freezing point (like that with vapour pressure) seems to give results which accord with experiments.

Osmotic Pressure. At the limit of dilution, when the concentration of a solution approaches zero, we have seen that thermodynamical theory, verified by experiment, shows that the osmotic pressure has the same value as the gas pressure of the same number of molecules in the same space. Gases at high pressures fail to conform to Boyle's law, and solutions at moderate concentrations give osmotic pressures which increase faster than the concentration. The variation of gases from Boyle's law is represented in the equation of Van der Waals by subtracting a constant b from the total volume to represent the effect of the volume of the molecules themselves. The corresponding correction in solutions consists in counting only the volume of the solvent in which the solute is dissolved, instead of the whole volume of the solution.

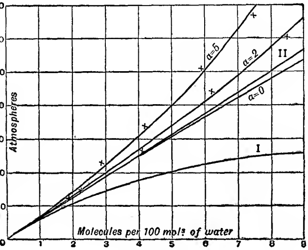

FIG. 15.

In fig. 15 the curve I represents Boyle's law if the volume is taken to be that of the solution, and the curve II if the volume is that of the solvent. Even this correction is not sufficient in solution of sugar, where the theoretical curve II lies below the experimental observations. A further correction may be made by adding more empirical terms to the equation, but a more promising idea, due to J. H. Poynting and H. L. Callendar is to trace the effect of possible combination of molecules of solute with molecules of the solvent. These combined solvent molecules are thus removed from existence as solvent, the effective volume of which is reduced to that of the remaining free molecules of solvent. The greater the number of water molecules attached to one sugar molecule, the less the residual volume, and the greater the theoretical pressure. Callendar finds that five molecules of water in the case of cane-sugar or two molecules in the case of dextrose are required to bring the curves into conformity with the observations of Berkeley and Hartley, which in fig. 15 are indicated by crosses.

Solubility and Heat of Solution.—The conceptions of osmotic pressure and ideal semi-permeable membranes enable us to deduce other thermodynamic relations between the different properties of solutions. As an example, let us take the following investigation:—

An engine cylinder may be imagined to possess a semi-permeable bottom and to work without friction. If it be filled with a solution and the bottom immersed in the pure solvent, pressure equal to the osmotic pressure must be exerted on the piston to maintain equilibrium. Such a system is in the thermodynamic equilibrium. The slightest change in the load will cause motion in one direction or the other—the system is thermodynamically reversible. Such an arrangement may be put through a cycle of operations as in Carnot's engine (see THERMODYNAMICS) and all the laws of reversible engines applied to it. If the solution in the cylinder be kept saturated by the presence of crystals of the solute, crystals will dissolve as solvent enters, and the solution remains saturated throughout. By an imaginary cycle of operations we may then justify the application to solutions of the latent heat equation which we have already assumed as applicable. In the equation $dP/dT = \lambda/T(v_2-v_1)$, P is the osmotic pressure, T the absolute temperature and λ the heat of solution of unit mass of the solute when dissolving to form a volume v_2-v_1 of saturated solution in an osmotic cylinder. This process involves the performance of

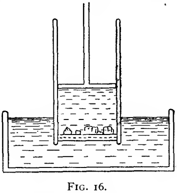

FIG. 16.

an amount of osmotic work $P(v_2-v_1)$. If the heat of solution be measured in a calorimeter, no work is done, so that, if we call this calorimetric heat of solution L, the two quantities are connected by the relation $L=\lambda+P(v_2-v_1)$. If L is zero or negligible, $\lambda=-P(v_2-v_1)$ and we have $dP/dT=-P/T$ or $dP/P=-dT/T$, which on integration gives $\log P=\log T+C$, or $P=kT$, *i.e.* the osmotic pressure is proportional to the absolute temperature. This result must hold good for any solution, but if the solution be dilute when saturated, that is, if the solubility be small, the equation shows that if there be no heat effect when solid dissolves to form a saturated solution, the solubility is independent of temperature, for, in accordance with the gas laws, the osmotic pressure of a dilute solution of constant concentration is proportional to the absolute temperature. It follows that if the thermodynamic heat of solution be positive, that is, if heat be absorbed to keep the system at constant temperature, the solubility will increase with rising temperature, while if heat be evolved on dissolution, the solubility falls when the system is heated.

In all this investigation it should be noted that the heat of solution with which we are concerned is the heat effect when solid dissolves to form a saturated solution. It is not the heat effect when solid is dissolved in a large excess of solvent, and may differ so much from that effect as to have an opposite sign. Thus cupric chloride dissolves in much water with an evolution of heat, but when the solution is nearly saturated, it is cooled by taking up more of the solid.

Osmotic Pressure and Temperature. In a very dilute solution no appreciable heat is evolved or absorbed when solvent is added, but such heat effects are generally found with more concentrated solutions. The result is to change the relation between temperature and the osmotic pressure of a solution of constant concentration, a relation which, in very dilute solutions, is a direct proportionality.

The equation of available energy (see ENERGETICS) $A=U+TdA/dT$ may be applied to this problem. The available energy A is the work which may be gained from the system by a small reversible isothermal operation with an osmotic cylinder, that is Pdv. If l is the heat of dilution per unit change of volume in a calorimeter where all the energy goes to heat, the change in internal energy U is measured by ldv. We then have

$$Pdv=ldv+T\frac{d}{dT}(Pdv).$$

Neglecting the volume change with temperature this gives $P=l+TdP/dT$ for the relation required. In the case where l is negligible we have $P/dP=T/dT$, which on integration shows that the osmotic pressure, as in the special case of a dilute solution, is proportional to the absolute temperature.

Theories of Solution.—The older observers, noticing the heat effects which often accompany dissolution, regarded solutions as chemical compounds of varying composition. The physical investigation of osmotic pressure, and its correlation by Van't Hoff with the pressure of a gas, brought forward a new aspect of the phenomena, and suggested an identity of physical *modus operandi* as well as of numerical value. On this view, the function of the solvent is to give space for the solute to diffuse, and the pressure on a semi-permeable membrane is due to the excess of solvent molecules entering over those leaving in consequence of the smaller number which impinge on the membrane from the side of the solution; the defect in the number must be proportional, roughly at any rate, to the number of solute molecules, present, that is, to the strength of the solution.

Whatever view, if any, be adopted as to the nature of a solution, the thermodynamic relations we have investigated equally hold good. It is the strength and weakness of thermodynamic methods that they are independent of theories of constitution. The results are true whatever theory be in vogue, but the results throw no light on the problem of which theory to choose. All the thermodynamic relations we have deduced hold on any theory of solution and favour no one theory rather than another. Whether osmotic pressure be due to physical impact or to chemical affinity it must necessarily have the gas value in a dilute solution, and be related to vapour pressure and freezing point in the way we have traced. But for any theory of solution to be tenable, it must at least be consistent with the known thermodynamic relations, verified as those relations are by experiment.

On certain assumptions required for the extension of the methods of the kinetic theory of gases to liquids, L. Boltzmann offered a demonstration of the law of osmotic pressure in dilute solutions, based on the idea that the mean energy of translation of a molecule should be the same in the liquid as in the gaseous state. But, whether or not the assumption underlying this demonstration be accepted, the similarity between solution and chemical action remains, and the osmotic law has been examined from this side by J. H. Poynting and by H. L. Callendar. The fundamental phenomenon they take to be the identity of vapour pressure, and consider the combination necessary to reduce the vapour pressure of a solution to the right value. If each molecule of the solute combines with a certain number of molecules of the solvent in such a way as to render them inactive for evaporation, we get a lowering of vapour pressure. Let us assume that the ratio p/p' of the vapour pressures of the solvent and solution is equal to the ratio of the number of free molecules of solvent to the whole number of molecules in the solution. Each molecular complex, formed by solution and solvent, is treated as a single molecule. If there are n molecules of solute to N of solvent originally, and each molecule of solute combines with a molecule of solvent, we get for the ratio of vapour pressures $p/p'=(N-an)/(N-an+n)$, while the relative lowering of vapour pressure is $(p-p')/p=n/(N-an)$.

In the limit of dilution when n is very small compared with N this gives Raoult's experimental law that the relative lowering is n/N, which we deduced from the osmotic law, and conversely from which the osmotic law follows, while for more concentrated solutions agreement is obtained by assigning arbitrary values to a, which, as we have seen, is 5 in the case of cane-sugar.

Certain solvents, such as water, liquid ammonia or liquid hydrocyanic acid, possess the power of making some solutes, such as mineral salts and acids, when dissolved in them, conductors of electricity. The special properties of these solutions are dealt with under ELECTROLYSIS and CONDUCTION, ELECTRIC, § *In Liquids*. Attempts have been made to co-ordinate this ionizing power of solvents with their dielectric constants, or with their chemical properties. On the lines of Poynting's theory of solution, each ion in electrolytes must combine with one or more molecules of solvent.

Diffusion in Solutions.—The passage of dissolved substances through animal and vegetable membranes was the subject of many early experiments. It was found that substances like mineral salts, which crystallize well from solution, passed such membranes with comparative ease, while the jelly-like substances such as albumen passed with extreme slowness if at all. The first to make systematic experiments on the free diffusion of dissolved substances with no separating membrane was Thomas Graham (1804–1869), who immersed in a large volume of water a wide-mouthed bottle containing a solution, and after some time measured the quantity of substance which had diffused into the water. Again the two classes of substances mentioned above were found to be distinguished, and Graham called the slowly diffusible non-crystalline bodies colloids, in contrast to the quickly diffusible crystalloids. Graham showed that the diffusion was approximately proportional to the difference in concentration, and on these lines a theory of diffusion was founded on the lines of Fourier's treatment of the conduction of heat.

The quantity of substance which diffuses through unit area in one second may be taken as proportional to the difference in concentration between the fluids at that area and at another parallel area indefinitely near it. This difference in concentration is proportional to the rate of variation—dc/dx of the concentration c with the distance x, so that the number of gramme-molecules of solute which, in a time dt, cross an area A of a long cylinder of constant cross section is $dN=-DA(dc/dx)dt$, where D is a constant known as the diffusion constant or the diffusivity.

The osmotic pressure of a solution depends on the concentration, and, if we regard the difference in that pressure as the effective force driving the dissolved substance through the solution, we are able to obtain the equation of diffusion in another form. When the solution is dilute enough for the osmotic pressure to possess "the gas" value the equation becomes—

$$dN=-\frac{RT}{F}A\frac{dc}{dx}dt,$$

where R is the usual gas constant, T the absolute temperature, and F the force required to drive one gramme-molecule of the solute through the solution with unit velocity.

By comparison with the first equation we see that RT/F is equal to D, the diffusion constant. This constant can be measured experimentally, and for such a substance as sugar or water comes out about 0·3 at 20° C., the unit of time being the day. Hence the force required to drive one gramme-molecule of sugar through water with a velocity of one centimetre per second may be calculated as some thousands of millions of kilogrammes weight.

In the case of electrolytes we can go further, and calculate the diffusion constant itself from the theory of electrolytic dissociation (see CONDUCTION, ELECTRIC, § *In Liquids*). On that theory the ions of a dilute solution migrate independently of each other. Since some ions are more mobile than others, a separation will ensue when water is placed in contact with a solution, the faster moving ion penetrating quicker into the water under the driving force of the osmotic pressure gradient. This separation causes a difference of potential, which can be calculated and is found to agree with the values obtained experimentally. The separation also sets up electrostatic forces, which increase until they are strong enough to drag the slower moving ions along faster, and to retard the naturally faster ions till they travel at the same rate. The resistance offered by the liquid, and therefore the force F, required to drive one gramme-molecule through the liquid with unit velocity is the sum of the corresponding quantities for the individual ions. Now the velocities u and v of the opposite ions under unit potential gradient, and therefore U and V under unit force, are known from electrical data. Thus F, which is equal to $1/U+1/V$, is known. The osmotic pressure of an electrolyte consisting of two ions is double that of a non-electrolyte. Hence for a binary electrolyte the diffusion constant is measured by $2RT/F$ or $2UVRT/(U+V)$. This result gives a value of D for dilute hydrochloric acid equal to 2·49 to compare with the observed value of 2·30. Other substances give equally good agreements; thus sodium chloride has a calculated constant of 1·12 and an observed one of 1·11. Such concordance gives strong support to the theory of diffusion outlined above.

Colloidal Solutions.—Besides a large number of animal and vegetable substances, many precipitates formed in the course of inorganic chemical reactions are non-crystalline and appear in the colloidal state, instances are the sulphides of antimony and arsenic and the hydroxides of iron and alumina. Some of these colloids dissolve in water or other liquids to form solutions called by Graham *hydrosols*; Graham named the solids formed by the setting or coagulation of these liquids *hydrogels*. Solutions of colloids in solvents such as water and alcohol seem to be divisible into two classes. Both mix with warm water in all proportions, and will solidify in certain conditions. One class, represented by gelatin, will redissolve on warming or diluting, while the other class, containing such substances as silica, albumen, and' metallic, hydrosulphides, will solidify on heating or on the addition of electrolytes to form a solid "gel" which cannot be redissolved. Solidification of the first kind may be termed "setting," that of the second "coagulation."

The power of coagulation of colloids shown by electrolytes depends in a curious manner on the chemical valency of the effective ion. The average of the coagulative powers of salts of univalent, divalent and trivalent metals have been found by experiment to be proportional to the numbers 1 : 35 : 1023. If we assume that a certain minimum electric charge must be brought into contact with a group of colloid particles to produce coagulation, twice as many univalent ions must collect to produce the same effect as a number of divalent ions, and three times as many as an effective number of trivalent ions. We can calculate, by the help of the kinetic theory and the theory of chances, the frequency with which the necessary conjunctions of ions will occur, and show that the general law will be that the coagulative powers should be in the ratios of $1 : x : x^2$. Putting $x=32$, we get 1 : 32 : 1024 to compare with the experimental numbers. The ordinary surface energy of a two-phase system tends to diminish the area of contact, and thus to help the growth of the larger aggregates required for coagulation. A natural electric charge on the particles would oppose this tendency, and tend to increase the free surface and thus promote disintegration and solution. The function of the electrolyte may be to annul such a natural charge and thus allow the non-electric surface energy to produce coagulation. This explanation is supported by some experiments by W. B. Hardy, who found that certain colloids did possess electric charges, the sign of which depended on whether the surrounding liquid was slightly acid or slightly alkaline. At the neutral point, when the particles possessed no charge, their stability was destroyed, and they were precipitated. But recent experiments have shown that the simple theory of coagulation here outlined needs amplification in certain directions. The phenomena seem to be dependent on variables such as time, and are more complicated than seemed likely at first.

The size of the suspended particles in colloidal solutions varies greatly. In some solutions they are visible under a good microscope. In other cases, while too small to be directly visible, they are large enough to scatter and polarize a beam of light. In yet other solutions, the particles are smaller again, and seem to approach in size the larger molecules of crystalloid substances. It is not yet agreed whether colloid solution is the same in kind though different in degree from crystalloid solution or is a phenomenon of an entirely different order.

REFERENCES.—The properties and theory of solutions are treated in all works on general physical chemistry; Ostwald's discussion in his *Lehrbuch* was translated into English in 1891 by M. M. P. Muir entitled *Solution*. Special works are W. C. D. Whetham, *Theory of Solution* (1902); W. Rothmund, *Löslichkeit* (1907). Solubility tables are given in Landolt, Börnstein and Meyerhoffers, *Tabellen* (1905); A. M. Comey, *Dictionary of Solubilities (Inorganic)* (1896); A. Seidell, *Dictionary of the Solubilities of Inorganic and Organic Substances* (1907). (W. C. D. W.)

SOLUTRIAN EPOCH, in archaeology, the name given by G. de Mortillet to the second stage of his system of cave-chronology, and that synchronous with the third division of the Quaternary period. It is so called from the Solutré Cave, Maçon district, Saône-et-Loire. The period is characterized by two series of chipped flints, one modelled on the laurel-leaf, the other on that of the willow. Those of the first series are artistically chipped upon the two faces and the end, and are readily distinguishable from the flints of the preceding Mousterian epoch. Large thin spear-heads; scrapers with edge not on the side but on the end; flint knives and saws, but all still chipped, not ground or polished; long spear-points, with tang and shoulder on one side only, are also characteristic implements of this epoch. Bone or horn, too, was used. The Solutrian work exhibits a transitory stage of art between the flint implements of the Mousterian and the bone implements of the Madelenian epochs. The fauna includes the horse, reindeer, mammoth, cave lion, rhinoceros, bear and urus. Solutrian "finds" have been also made in the caves of Les Eyzies and Laugerie Haute, and in the Lower Beds of Cresswell Cave (Derbyshire).

SOLWAY FIRTH, an estuarine inlet of the Irish Sea, between England and Scotland. If its mouth be taken as between St Bee's Head on the English and Burrow Head on the Scottish coast, its length is 50 m. The breadth at the mouth is 32 m.; near the head, where the Solway viaduct of the Caledonian railway crosses the firth, it is nearly 1½ m. The general direction is north-easterly from the mouth. The Scottish counties bordering the firth are Wigtownshire, Kirkcudbright and Dumfriesshire; the English coast belongs to Cumberland. On the English side the low Solway Plain borders the firth, except for a short distance above St Bees Head. The Scottish shore, however, is not continuously flat, and such elevations as Criffell (1866 ft.), Bengairn (1250) and Cairnharrow (1497), above Wigtown Bay, rise close to it. The shore line is broken on both sides by the estuaries of several rivers. Thus in Scotland the Cree and other streams enter Wigtown Bay; the Dee, Kirkcudbright Bay; Auchencairn Bay and Rough Firth receive numerous small streams, and the Nith discharges through a long estuary. The Annan has its mouth near the town of that name; and the Esk and Eden at the head of the firth, in Cumberland. On this shore Morecambe Bay receives the Wampool and Waver from the plain, the Ellen has its mouth at Maryport, and the Derwent from the Lake District at Workington. The waters of the firth are shallow, and a tidal bore occurs periodically. The fisheries are extensive, and though there are no ports of the first magnitude on the firth, a considerable shipping trade is carried on at Whitehaven, Harrington, Workington, Maryport and Silloth in Cumberland, and at Annan, Kirkcudbright, Creetown and Wigtown on the Scottish side.

SOMA (Sanskrit for "pressed juice," from the root *su*, to press), in Hindu mythology the god who is a personification of the soma plant (*Asclepias acida*), from which an intoxicating milky juice is squeezed. Soma is the Indian Bacchus, and one of the most important of the Vedic gods. All the 114 hymns of the ninth book of the Rig Veda are in his praise. He is celebrated as a dual divinity with Indra, Agni, Pushan or Rudra, in other books. The preparation of the soma juice was a very sacred ceremony, and the worship of the god is very old, soma being identifiable with the Avestan *homa*, prepared and celebrated in the Indo-Iranian period. The plant's true home is heaven, and soma is drunk by gods as well as men, and it is under its influence that Indra is related to have created the universe and fixed the earth and sky in their place. In post-Vedic literature soma is a regular name for the moon, which is regarded as being drunk up by the gods and so waning, till it is filled up again by the sun. In both the Rig Veda and Zend Avesta soma is the king of plants; in both it is a medicine which gives health, long life and removes death. In both the celestial is distinguished from the terrestial soma, and the liquor from the god. The first soma is supposed to have been stolen from its guardian demon by an eagle, this soma-bringing eagle of Indra being comparable with the nectar-bringing eagle of Zeus, and with the eagle which, as a metamorphosis of Odin, carried off the mead.

See A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897).

SOMALILAND, a country of East Africa, so named from its Somali inhabitants. It is also known as the "Eastern Horn of Africa," because it projects somewhat sharply eastwards into the Indian Ocean, and is the only section of the continent which can be spoken of as a peninsula. In general outline it is an irregular triangle, with apex at Cape Guardafui. From the apex the north side extends over 600 m. along the south shore of the Gulf of Aden westwards to Tajura Bay, and the east side skirts the Indian Ocean south-west for over 1000 m. to the mouth of the Juba. Somali also inhabit the coast region and considerable areas inland, as far south as the Tana river. The country between the Tana and Juba rivers now forms part of British East Africa (*q.v.*), and in this article is not included in Somaliland. Inland the limits of Somaliland correspond roughly with the Shoan and Harrar Hills, and the Galla district south of Shoa and east of Lake Rudolf. The 40° east may be taken as the western limit of Somali settlements. The triangular space thus roughly outlined has a total area of about 356,000 sq. m. The population is estimated at about 1,100,000, but no trustworthy data are available. It is partitioned between Great Britain, Italy, France, and Abyssinia as under:—

	Area in sq. m.	Population.
British Somaliland	68,000	300,000
French Somaliland	12,000	50,000
Italian Somaliland	146,000	400,000
Abyssinian Somaliland [1]	130,000	350,000
Total	356,000	1,100,000

Somaliland was not generally adopted as the name of the country until the early years of the 19th century. The northern and central districts were previously known as Adel, the north-east coast as Ajan. By the ancients the country was called *regio romataica*, from the abundance of aromatic plants which it produced.

Physical Features.—The whole region is characterized by a remarkable degree of physical uniformity, and may be broadly described as a vast plateau of an average elevation of 3000 ft., bounded westwards by the Ethiopian and Galla highlands and northwards by an inner and an outer coast range, skirting the south side of the Gulf of Aden in its entire length from the Harrar uplands to Cape Guardafui. The plateau, known as the Ogaden plateau, everywhere presents the same monotonous aspect of a boundless steppe clothed with a scanty vegetation of scrubby plants and herbaceous growths.

The incline is uniformly to the south-east, and apart from the few coast streams that reach the Gulf of Aden during the rains, all the running waters are collected in three rivers—the Nogal in the north, the Webi Shebeli in the centre, and the Juba (*q.v.*) in the south—which have a parallel south-easterly direction towards the Indian Ocean. But so slight is the precipitation that the Juba alone has a permanent discharge seawards. The Nogal sends down a turbulent stream during the freshets, while the Shebeli, notwithstanding the far greater extent of its basin, does not reach the sea. At a distance of about 12 m. from the coast it is intercepted by a lone line of dunes, which it fails to pierce and is thus deflected southwards, flowing in this direction for nearly 170 m. parallel with the coast, and then disappearing in a swampy depression (the Bali marshes) before reaching the Juba estuary.[2]

Geology.—The Somaliland plateau is chiefly composed of gneiss and schist. In the north the plateau is overlain by red and purple unfossiliferous sandstones, capped near its edge by a cherty limestone also unfossiliferous but possibly of Lower Cretaceous age. The plains inland from Berbera, and the maritime margins between the coast and foot of the plateau, consist of limestones of Lower Oolitic age with *Belemnites subhastatus*. At Duba some limestones may belong to the Lower Cretaceous.

Climate.—In general the climate is dry and bracing all over the plateau. Temperature is as a rule high but with considerable variation, from 60° F. or less in the early morning to 100° or over in the early afternoon. On an average the coast-belt temperatures are some 10° higher than those of the plateau. Four seasons are recognized—January–April, very dry and great heat; May–June, cooler and the "heavy" rains; July–September, the season of extreme heat and the south-west monsoon; October–December, the "light" rains. The "heavy" rains are little experienced in the coast districts. The rainfall is from 4 to 8 in. a year. In consequence of the elevation of the plateau and the dryness of the air, the heat is less oppressive than is indicated by the temperatures recorded. Malaria prevails in the valley of the Webi Shebeli.

Flora.—The highlands, which in an almost continuous line traverse East Africa, have to a great extent isolated the flora of Somaliland in spite of the general resemblance of its climate and soil to the country on the western side of the band of high ground. In the northern mountainous regions of Somaliland the flora resembles, however, to some extent, that of the Galla country and Abyssinia. On the plateau many forms common elsewhere in East Africa, such as the *Borassus* palm and the baobab tree, are missing. The greater part of the country is covered either with tall coarse grasses (these open plains being called *ban*), or more commonly with thick thorn-bush or jungle, among which rise occasional isolated trees. The prevalent bush plants are *khansa* (umbrella mimosa), acacias, aloes, and, especially, *Boswellia* and *Commiphora*, which yield highly fragrant resins and balsams, such as myrrh, frankincense (*olibanum*) and "balm of Gilead." The billeil is a thorn-bush growing about 10 ft. high and covered with small curved hooks of great strength. The bush contains also numerous creepers, one of the most common being known as the *armo*. It is a vivid green and has large, fleshy, heart-shaped leaves. Of the thorns, the *guda* and the *wadi* often grow from 30 to 50 ft. high and have large flat-topped branches. In places there are forests of these trees. On the summit of the Golis range the cedars form forests. Among the larger trees are the mountain cedar, reaching to 100 ft.; the *gob*, which bears edible berries in appearance something like the cherry with the taste of an apple, grows to some 80 ft., and is found fringing the river beds; the *hassādan*, a kind of euphorbia, attaining a height of about 70 ft.; and the *darei*, a fig tree. There are patches of dense reeds, reaching 10 ft. high, and thickets of tamarisk along the river beds, and on either side the jungle is high and more luxuriant than on the open plateau. Of herbaceous plants the *kissenia*, the sole representative of the order Loasaceae, which is common in America but very rare elsewhere, is found in Somaliland, which also possesses forms belonging to the eastern Mediterranean flora.

Fauna.—Somaliland is rich in the larger wild animals. Among them are the lion (Somali name *libah*) and elephant, though these have been to a large extent driven from the northern coast districts; the black or double-horned rhinoceros, common in central Ogaden; leopards, abundant in many districts, and daring—they have given their name to the Webi Shebeli ("River of the Leopards"); panthers; spotted and striped hyenas (the latter rare); foxes, jackals, badgers and wild dogs; giraffes and a great variety of antelopes. The antelopes include the beisa oryx, fairly common and widely distributed; the greater and lesser kudu (the greater kudu is not found on the Ogaden plateau); the Somali hartebeest (*Bubalis Swaynei*), found only in the Haud and Ogo districts; waterbuck, rare except along the Webi Shebeli and the Nogal; the dol or Somali bushbuck; the dibatag or Clarke's gazelle; the giraffe-like gerenuk or Waller's gazelle, very common; the aoul or Soemmering's gazelle, widely distributed; the dero (*Gazella Speki*); and the small dikdik or sakaro antelope, found in almost every thicket. The zebra (*Equus grevyi*) is found in Ogaden and places to the south, the wild ass in the northern regions. There are wart hogs, baboons (maned and maneless varieties), a tree monkey, jumping shrews, two kinds of squirrel, a small hare, rock rabbits

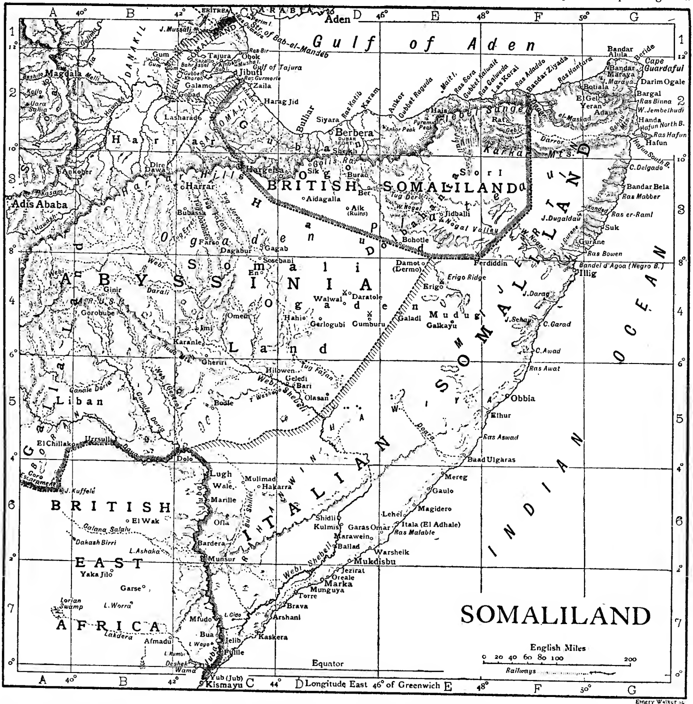
[1] See also ABYSSINIA.

[2] It is probable that a divergent branch leaves the Shebeli some distance above the swamps and that at high water an overflow into the Juba occurs (see *Geog. Journ.*, Nov. 1909).

and a weasel-like animal which hunts in packs. Ostriches are found in the open plains; the rivers swarm with crocodiles, but hippopotami are rare. Birds of prey are numerous and include eagles, vultures, kites, ravens and the carrion stork. Among game birds are three varieties of bustard, guinea fowl, partridges, sand grouse and wild geese. Snakes are common, an adder, a variegated rock snake and a black snake called *muss* being those most dreaded. Mosquitoes are rarely troublesome; gadflies, and a large spider (*hangeyu*), which spins a web resembling golden silk, are common, as are scorpions and centipedes. Termites rear sharp pointed "hills," often over 20 ft. high. A species of lizard grows nearly 4 ft. long.

Inhabitants.—The Somali belong to the Eastern (Ethiopic) Hamitic family of tribes, of which the other chief members are the neighbouring Galla and Afar, the Abyssinian Agau and the Beja tribes between the Nubian Nile and the Red Sea. They have been identified with the people of Punt, who were known to the Egyptians of the early dynasties. The Somali, however, declare themselves to be of Arab origin, alleging their progenitor to have been a certain Sherīf Ishak b. Ahmad, who crossed from Hadramut with forty followers about the 13th century. Other traditions trace their origin to the Himyaritic chiefs Sanhāj and Samamah, said to have been coeval with a King Afrikus, who is supposed to have conquered Africa about A.D. 400. These legends should perhaps be interpreted as pointing to a series of Arab immigrations, the last two of which are referred to the 13th and 15th centuries. But these intruders seem to have been successively absorbed in the Somali stock; and the Arabs never succeeded in establishing permanent communities in this region. Their influence has been very slight even on the Somali language, whose structure and vocabulary are essentially Hamitic, with marked affinities to the Galla on the one hand and to the Dankali (Afar) on the other.

The present Somali peoples are possessed of no general type. They are not pure Hamites, and their physical characteristics vary considerably, showing signs of interbreeding with Galla, Afar, Arabs, Abyssinians, Bantus and Negroes. They are a



race of magnificent physique, tall, active and robust, with fairly regular features, but showing Negro blood in their frequently black complexion and still more in their kinky and even woolly hair. Their colour varies from the Arab hue to black, and curiously enough the most regular features are to be found among the darkest groups.

There are four classes in Somaliland: (1) nomads who breed ponies, sheep, cattle and camels, live entirely on milk and meat, and follow the rains in search of grass; (2) settled Somali, comparatively few, living in or near the coasts; (3) outcast races, not organized in tribes but living scattered all over Somaliland; they are hunters, workers in iron and leather, and the chief collectors of gum and resin; (4) traders. The national dress is the "tobe," a simple cotton sheet of two breadths sewn together, about 15 ft. long. Generally it is thrown over one or both shoulders, a turn given round the waist, and allowed to fall to the ankles. The "tobes" are of all colours from brown to white. A ceremonial "tobe" of red, white and blue, each colour in two shades, with a narrow fringe of light yellow, is sometimes worn. Old men shave the head and sometimes grow a beard. Middle-aged men wear the hair about an inch and a half long; young men and boys in a huge mop; while married women wear it in a chignon, and girls in mop-form but plaited.

The Somali are a fighting race and all go armed with spear, shield and short sword (and guns when they can get them). During the rains incessant intertribal lootings of cattle take place. Among certain tribes those who have killed a man have the right to wear an ostrich-feather in their hair. They are great talkers, keenly sensitive to ridicule, and quick-tempered.

Women hold a degraded position among the Somali (wives being often looted with sheep), doing most of the hard work. The Somali love display; they are inordinately vain and avaricious; but they make loyal and trustworthy soldiers and are generally bright and intelligent.

The Somali have very little political or social cohesion, and are divided into a multiplicity of *rers* or *fakidas* (tribes, clans). Three main divisions, however, have been clearly determined, and these are important both on political and ethnical grounds.

I. The Hashīya (Abud's *Asha*), with two great subdivisions: *Daroda*, with the powerful Mijertins, War-Sangeli, Dolbohanti and others; and *Ishak*, including the Gadibursi, Issa (Aïssa), Habr-Wal, Habr-Tol, Habr-Yuni, Babibli, Bertiri. All these claim descent from a member of the Hashim branch of the Koreish (Mahomet's tribe), who founded a powerful state in the Zaila district. All are Sunnites, and, although still speaking their Somali national tongue, betray a large infusion of Arab blood in their oval face, somewhat light skin, and remarkably regular features. Their domain comprises the whole of British Somaliland, and probably most of Italian Somaliland.

II. The Hawīya, with numerous sub-groups, such as the Habr-Jalet, Habr-Gader, Rer-Dollol, Daji, Karanlē, Badbadan, Kunli, Bajimal and Ugass-Elmi; mostly fanatical Mahommedans forming the powerful Tarika sect, whose influence is felt throughout all the central and eastern parts of Somaliland. The Hawīya domain comprises the Ogaden plateau and the region generally between the Nogal and Webi-Shebeli rivers. Here contact has been chiefly with the eastern Galla tribes.

III. The Rahanwīn, with numerous but little-known sub-groups, including, however, the powerful and warlike Abgals, Barawas, Gobrons, Tuni, Jidus and Kalallas, occupy in part the region between the Webi-Shebeli and Juba, but chiefly the territory extending from the Juba to the Tana, where they have long been in contact, mostly hostile, with the Wa-Pokomo and other Bantu peoples of the British East Africa Protectorate. Of all the Somali the Rahanwīn betray the largest infusion of negroid blood.

Of the outcast races the best known are the Midgan, Yebir, and Tomal. The Midgan, who are of slightly shorter stature than the average Somali, are the most numerous of these peoples. They are great hunters and use small poisoned arrows to bring down their game. The Yebir are noted for their leather work, and the Tomal are the blacksmiths of the Somali.

Prehistoric Remains.—The discovery of flint implements of the same types as those found in Egypt, Mauritania, and Europe show Somaliland to have been inhabited by man in the Stone age. That the country was subsequently occupied by a more highly civilized people than the Somali of to-day is evidenced by the ruins which are found in various districts. Many of these ruins are attributable to the Arabs, but older remains are traditionally ascribed to a people who were "before the Galla." Blocks of dressed stone overgrown by grass lie in regular formation; a series of parallel revetment walls on hills commanding passes exist, as do relics of ancient water-tanks. This ancient civilization is supposed to have been swept away by Mahommedan conquerors; before that event the people, in the opinion of several travellers, professed a degraded form of Christianity, which they had acquired from their Abyssinian neighbours. Of more recent origin are the ruins known as Galla graves (*Taalla Gālla*). These are cairns of piled stones, each stone about the size of a man's head. The cairns are from 12 to 15 ft. high and about 8 yds. in diameter. Each is circular with a central depression.

Exploration.—Somaliland was one of the last parts of Africa to be explored by Europeans. The occupation of Aden by the British in 1839 proved the starting-point in the opening up of the country, Aden being the chief port with which the Somali of the opposite coast traded. The task of mapping the coast was largely undertaken by officers of the Indian navy, while the first explorers of the interior were officers of the Indian army quartered at Aden—Lieut. Cruttenden (1848), Lieut. (afterwards Captain Sir Richard) Burton, and Lieut. J. H. Speke (the discoverer of the Nile source). In 1854 Burton, unaccompanied, penetrated inland as far as Harrar. Later on the expedition was attacked by Somali near Berbera, both Burton and Speke being wounded, and another officer, Lieut. Stroyan, R.N., killed. For twenty years afterwards no attempt was made to open up the country. The occupation of Berbera by the Egyptians in 1875 was, however, followed by several journeys into the interior. Of those who essayed to cross the waterless Haud more than one lost his life. In 1883 a party of Englishmen—F. L. and W. D. James (brothers), G. P. V. Aylmer, and E. Lort-Phillips—penetrated from Berbera as far as the Webi-Shebeli, and returned in safety. At the instance of the Indian government surveys of the country between the coast and the Webi-Shebeli and also east towards the Wadi Nogal were executed by Major H. G. C. Swayne and his brother Captain E. J. E. Swayne between 1886 and 1892. Meanwhile a French traveller, G. Révoil, had (1878–1881) made three journeys in the north-east corner of the protectorate, especially in the Darror valley. The first person who reached the Indian Ocean, going south from the Gulf of Aden, was an American, Dr A. Donaldson Smith (b. 1864). He explored (1894–1895) the headstreams of the Shebeli, reached Lake Rudolf, and eventually descended the Tana river to the sea, his journey thus taking him through southern Somaliland. Meantime the greater part of the eastern seaboard having fallen under Italian influence, the exploration of the hinterland had been undertaken by travellers of that nationality. In 1890 Brichetti-Robecchi made a journey along the eastern coast from Obbia to beyond Cape Guardafui. In the following year he went from Mukdishu to Obbia, and thence crossed through Ogaden to Berbera on the Gulf of Aden. In the same year Prince Eugenio Ruspoli made a journey southwards from Berbera, while two other Italians penetrated to Imi on the upper Shebeli, which place was also reached in 1903 by H. G. C. Swayne. In 1892 Captain Vittorio Bottego and a companion left Berbera and made their way past Imi to the upper Juba, which Bottego explored to its source, both travellers finally making their way via Lugh to the east coast. Prince Ruspoli in 1893 reached Lugh from the north, thence turning north-west. He was killed in the Galla country by an elephant. In 1895 Bottego, with three European companions, left Brava to investigate the river system north of Lake Rudolf, and succeeded in tracing the Omo to that lake. Subsequently in the Abyssinian highlands the expedition was attacked by Galla and Captain Bottego was killed. Dr Sacchi, who was returning to Lugh with some of the scientific results of the mission, was also killed by natives. An English expedition under H. S. H. Cavendish (1896–1897) followed somewhat in Donaldson Smith's steps, and the last named traveller again crossed Somaliland in his journey from Berbera via Lake Rudolf to the Upper Nile (1899–1900). In 1902–1903 a survey of the Galla-Somali borderlands between Lake Rudolf and the upper Juba was executed by Captain P. Maud of the British army. Military operations during 1901–4 led to a more accurate knowledge of the south-eastern parts of the British protectorate and of the adjacent districts of Italian Somaliland.

British Somaliland

The British Somaliland protectorate extends along the Gulf of Aden for about 400 m. from the Lahadu Wells, near Jibuti, in the west, to Bandar Ziyada in 49° E., 180 m. W. of Cape Guardafui, and stretches from the coast inland for a breadth varying from 80 to 220 m. The protectorate is bounded W. by French Somaliland, S.W. by Abyssinian territory, and S.E. and E. by Italian Somaliland. About 50,000 persons are settled in the coast towns; the rest are nomads.

Topography, &c.—Physically the protectorate may be described as almost mountainous in contrast with the somewhat monotonous plains of the interior. Between the Harrar plateau and Cape Guardafui the coast ranges maintain a mean altitude of from 4000 to 5000 ft., and fall generally in steep escarpments down to the narrow strip of sandy lowlands skirting the Gulf of Aden. At some points the rugged cliffs, furrowed by deep ravines, approach close to the sea; elsewhere the hills leave a considerable maritime plain between their base and the shore line. South of Berbera are two ranges nearly parallel with the coast. They increase in elevation landwards, culminating in the inner and loftier Golis range, about 9500 ft. high, its crest covered with mountain cedar. The country between the two ranges is known as Guban. South of the Golis the ground falls gradually to the central plateau known as the Haud, a waterless but not unfertile district. The Haud (only the northern part of which is British territory—the rest is Abyssinian) consists partly of thorn jungle, the *haud* of the Somali, partly of rolling grass plains, called *ban*, and partly of semi-desert country called *aror*. Westward of Berbera the ascent to the high country is not so abrupt as in the east but is made by several steps, the mountains forming a chaotic mass. Eastwards the mountain system, the Jebel Sangeli, maintains the same general character as far as Bandar Gori (Las Korai), where the precipitous northern cliffs approach within 200 or 300 yards of the gulf, their bare brown rocks and clays presenting the same uninviting appearance as the light brown hills skirting the Red Sea Immediately south of the Jebel Sangeli are the comparatively fertile Jidali and Gebi districts or river valleys—the Gebi flowing east in the direction of Ras Hafun, while the Jidali has a southerly course towards the Wadi Nogal. Its waters are lost in the arid stony plateau of the Sorl. To this succeeds the Nogal district, separated both from the Sorl and the Haud by ranges of low hills. The Nogal and the neighbouring regions of the Haud are also known, from the tribes inhabiting them, as the Dolbahanta country. The prevailing formations appear to be granites which are veined with white quartz, and underlie old sedimentary brown sandstone and limestone formations.

The average annual rainfall at Berbera is about 8 in., and more than half of this amount has fallen in one day. The mean annual rainfall is greater on the slopes of the ranges by which the moisture-bearing clouds are intercepted. These slopes are the home of aromatic flora which yields myrrh and frankincense.

The chief domestic animals are the camel and the ass, both of prime stock. The camels make excellent mounts, swift and hardy; and the extensive caravan trade is everywhere carried on exclusively by means of these pack-animals. The Somali have also large herds of cattle—oxen, sheep and goats. They possess a hardy breed of ponies, for which the Dolbahanta country is famed.

Chief Towns.—Berbera (*q.v.*) is the capital and chief seaport of the protectorate. About 45 m. west of Berbera is the exposed port of Būlhar. Close to the French frontier stands the seaport of Zaila (*q.v.*). East of Berbera are Las Korai, Karam, Hais and other small seaports. Inland the most important settlement is Hargeisa (*i.e.* little Harrar), 60 m. S.S.W. of Būlhar, a centre for caravans from Shoa and Ogaden. Sheikh, Burao and Bohotle are all on the caravan route from Ogaden to Berbera.

Industries and Trade.—Fibre is obtained from the aloe plants, this industry being in the hands of women; ostriches are reared for the sake of their feathers, and large quantities of gum and resin are collected. But the wealth of the people consists chiefly in their livestock. Trade is largely with Harrar and the Ogaden country—both Abyssinian possessions. The important exports are gums and resin, fibre, hides, ivory, ostrich feathers, coffee, ghee, livestock, gold ingots from Abyssinia and mother-of-pearl; the shells being found along the coast from Zaila to beyond Berbera. There is also a profitable shark fishery in the hands of Arabs. The imports are mainly white longcloth, grey shirting, rice, jowaree, dates and sugar. Jowaree is displacing rice as the staple food of the Somali. The trade with Abyssinia suffers owing to the absence of railway communication, which the neighbouring French colony possesses. Thus in 1899–1900 the total value of trade was £751,900, the French railway being then but just begun; in 1902–1903, the railway being completed during the year, the value of trade was but £487,900. The average annual value of trade for 1904–1909 was about £500,000.

History.—An Arab sultanate, with its capital at Zaila (Zeyla), was founded by Koreishite immigrants from the Yemen in, it is said, the 7th century A.D. In the 13th century it had become a comparatively powerful state, known as the empire of Adel. In the 16th century the capital of the state (in which Arab influence was a decreasing factor) was transferred to Harrar (*q.v.*). The state was greatly harassed by Galla invaders in the 17th century, and broke up into a number of petty independent emirates and sultanates under Somali chiefs. Zaila became a dependency of Yemen and thus nominally part of the Turkish empire. The British connexion with the Somali coast dates from the early years of the 19th century; the first treaty between the British and Somali having been signed in 1827 after the plundering of an English ship by the Habr-Wal. In 1840 various treaties were concluded by Captain Robert Moresby of the Indian Navy "on the part of the English Government in India" with the sultan of Tajura and the governor of Zaila, who engaged not to enter into treaties with any other foreign power. At the same time Musha Island, at the entrance to the Gulf of Tajura, was bought by the British "for ten bags of rice," Bab Island, in the same gulf, and Aubad Island, off Zaila, were also purchased, the object of the East India Company being to obtain a suitable place "for the harbour of their ships without any prohibition whatever." From this time onward the Indian government exercised considerable influence on the Somali coast, but British authority was not definitely established, and in 1854 Richard Burton's expedition was attacked at Berbera. In 1874–1875 the ambition of Ismail Pasha, khedive of Egypt, who claimed jurisdiction over the whole coast as far as Cape Guardafui, led him to occupy the ports of Tajura, Berbera and Bulhar as well as Harrar in the hinterland. Ismail also obtained (July 1875) a firman from the sultan of Turkey making over Zaila to Egypt in return for an increase of £15,000 yearly to the tribute paid to the Porte. In 1884, in consequence of the revolt of the mahdi in the Egyptian Sudan, the khedival garrisons were withdrawn. Thereupon Great Britain, partly to secure the route to the East via the Suez Canal, which the occupation of the country by another power might menace, occupied Zaila, Berbera and Bulhar, officials being sent from Aden to govern the ports. With respect to Zaila Turkey was given the option of resuming possession, but advantage was not taken of the offer (see Lord Cromer's *Modern Egypt*, 1908, vol. ii.). During 1884, 1885, 1886 treaties guaranteeing British protection were concluded with various Somali tribes and in 1888 the limits of the British and French spheres were defined, all claims to British jurisdiction in the Gulf of Tajura and the islands of Musha and Bab being abandoned. The other inland boundaries of the protectorate were defined by agreements with Italy (1894) and Abyssinia (1897).

Establishment of a British Protectorate.

In 1899 troubles arose between the administration and a mullah of the Habr Suleiman Ogaden tribe, who had acquired great influence in the Dolbahanta country and had married into the Dolbahanta Ali Gheri. This mullah, Mahommed bin Abdullah by name, had made several pilgrimages to Mecca, where he had attached himself to a sect which enjoined strict observance of the tenets of Islam and placed an interdiction on the use of the leaves of the kat plant—much sought after by the coast Arabs and Somali for their stimulating and intoxicating properties. At first the mullah's influence was exerted for good, and he kept the tribes over whom he had control at peace. Accredited with the possession of supernatural powers he gathered around him a strong following. In 1899 the mullah began raiding tribes friendly to the British; in August of that year he occupied Burao, 80 m. south and east of Berbera, and declared himself the mahdi. In the autumn of 1900 the mullah was again harassing the tribes on the southern border of the British protectorate and the neighbouring Abyssinian districts. The tribes hostile to the mullah sought British protection, and Colonel (afterwards Sir) E. J. E. Swayne raised a Somali levy of 1500 men, and in May 1901 occupied Burao.

On the 2nd of June a small force, zeribaed under Captain Malcolm McNeill, was attacked by the mullah's followers but repulsed after desperate fighting. Colonel Swayne thrice defeated the enemy, who lost 1200 men and 600 taken prisoners, and the mullah fled across the Haud, taking refuge with the Mijertin in Italian territory. In December 1901 the mullah was, however, once more raiding in the neighbourhood of Burao, and in May 1902 Colonel Swayne led another expedition against him, the Somali levies being strengthened by the 2nd King's African Rifles, consisting of Yaos from Nyasaland. Overcoming in a remarkable manner the difficulties of operating in the dry season, Colonel Swayne harried the mullah incessantly, and followed him across the Haud into the more fertile region of Mudug in Italian territory, permission so to do being granted by Italy. On the 6th of October, while marching through dense bush at Erigo, the British force was ambuscaded. The British lost 101 killed and 85 wounded, but put the enemy to flight. The mullah lost some 700 men and retreated to Galadi, west of Mudug, a place with ample water supplies. Colonel Swayne was not able to continue the pursuit, and returned to Berbera. It was then determined that in the further operations against the mullah the main advance should be from a base on the east coast of Italian Somaliland—the open roadstead of Obbia being chosen. The command was given to Brigadier-General W. H. Manning, and small numbers of British and Boer mounted infantry, Indian and African troops were employed, while an Abyssinian force held the line of the Webi Shebeli. Manning advanced from Obbia in February 1903, and in March got in touch with the northern column, the line of communication stretching over 500 m. The mullah was west of this line in the neighbourhood of Galadi. The wells at Galadi were occupied by the British early in April without opposition. A reconnoitring force of 500 men under Lieut.-Colonel A. S. Cobbe (who had gained the V.C. at Erigo) was pushed west to Gumburu, and came into contact with the enemy. A detachment of this force, consisting of 200 Yaos and Sikhs under Lieut.-Colonel Plunket, was attacked on the 17th of April and overwhelmed. Of the whole party only 40 Yaos, of whom 36 were wounded, escaped; 10 British officers being among the slain. Meantime from Bohotle a force had advanced under Major Gough to Daratole, a spot not far from Gumburu. It had a stiff fight on the 23rd of April and was obliged to fall back. After these events the Obbia line of communication was closed up, and Manning's force concentrated at Bohotle. The mullah now broke away to the north, and, crossing the line of the British communication, established himself in the Nogal district.

Wars with the Mullah Mahommed Abdullah.

Another campaign being deemed necessary, reinforcements bringing the fighting force up to 7000 men were sent out, and Major-General Sir C. C. Egerton assumed supreme command, Manning retaining command of the first column. In October 1903 a new forward movement was begun, the mullah being still in the eastern Nogal, while he had also seized the Italian seaport of Illig, north of Obbia. In a pitched battle fought on the 10th of January 1904 at Jidballi in the Nogal country the enemy were routed, losing over 1000 men in killed alone, while the British loss in killed and wounded was 58. The mullah and his chief adviser, a Haji Sudi, formerly an interpreter on a British warship, were not at the battle, and with his Ali Gheri followers he now fled north across the Sorl, apparently intending, if further pressed to retreat to Illig. This port was accordingly for a short time (April 1904) occupied by a British naval force. By May the mullah had been driven out of the British protectorate and became a refugee among the Mijertin. It was decided therefore to abandon offensive operations. In 1905 the Italians effected an arrangement apparently satisfactory to all parties (see § *Italian Somaliland*).

For some three years the mullah remained quiescent, but in 1908 he quarrelled with the Mijertins and in 1909 he was again raiding tribes in the British protectorate The British government (the Asquith cabinet) came to the conclusion that another expedition against the mullah would be useless; that they must either build a railway, make roads and effectively occupy the whole of the protectorate, or else abandon the interior completely. The latter course was decided upon, and during the first months of 1910 the advanced posts were withdrawn and the British administration confined to the coast towns. In support of this decision it was urged that it was no good pursuing people whom it was impossible to catch, that the isolated posts in the interior had not been able to protect the friendly tribes; and that the semi-desert nature of the country did not justify any attempt at economic development. (The proposal to build a railway from Zaila or Berbera to Harrar, which would have competed with the French line from Jibuti for the trade of southern Abyssinia, had been vetoed on grounds of general policy.) Before the withdrawal arrangements—more or less ineffective—were made for arming and organizing the tribes in the protectorate in their own defence.

Evacuation of the Interior.

From 1884 to 1898 the protectorate was attached for administrative purposes to Bombay, and was immediately dependent on Aden; in the last-named year it was transferred to the Foreign Office, and in 1905 passed under the control of the Colonial Office. From 1902 to 1906 Colonel Swayne was commissioner; he was succeeded by Captain H. E. S. Cordeaux, who had served in Somaliland since 1898. Legislative power is in the hands of the commissioner, and revenue is obtained largely from customs. The revenue, £22,000 in 1900–1901, was £30,000 in 1908–1909, while the expenditure, £51,000 in the first-named year, was £134,000 in 1908–1909. Deficits are made good by grants from the imperial treasury.

French Somaliland

French Somaliland (*Côte française des Somalis*) lies at the entrance to the Red Sea. The sea frontier extends from Ras Dumeira on the Straits of Bab-el-Mandeb, a little north of Perim Island, to Ras Gurmarle, a few miles south of the Gulf of Tajura. The protectorate is bounded N. by the Danakil country; S. by British Somaliland; W. by the Harrar province of Abyssinia. It extends inland at its greatest depth about 130 m.

The country consists chiefly of slightly elevated arid plains, largely waterless save along the southern frontier. The only good harbour along the coast is at Jibuti. The Gulf of Tajura is 28 m. across at its entrance and penetrates inland 36 m. At its western end an opening 870 yds. wide leads into the circular bay of Gubbet-Kharab (Hell's Mouth), behind which rise a chaotic mass of volcanic rocks, destitute of vegetation and presenting a scene of weird desolation. A pass through the hills gives access to Bahr-Assal; the last of a chain of salt lakes beginning 60 m. inland in the depression in which the waters of the Hawash (see Abyssinia) lose themselves. It is conjectured that at some remote period the Hawash flowed into Tajura Bay and that the present condition of the country is the result of volcanic upheaval. Assal Lake, according to this theory, formed part of the sea bed. It is now 5 m. inland from Gubbet-Kharab, is 5 m. long by 4 broad, and lies 490 ft. below sea level. About 160 ft. above the present level of the lake a white band marks distinctly a former level. The waters of Bahr-Assal are deeply impregnated with salt, which, in thick crusts, forms crescent-shaped round the banks—dazzling white when reflected by the sun. Two streams, one saline and at a temperature of 194° F., flow into the lake. The climate of the protectorate is very hot, but not unhealthy for Europeans if reasonable precautions be taken.

Inhabitants and Towns.—The inhabitants are, on the north side of the Gulf of Tajura, chiefly Danakils (Afars, *q.v.*); on the southern shore Galla and Somali. There are a number of Arabs, Abyssinians, Indians, and about 2000 Europeans and Levantines. The chief town and seat of administration is Jibuti (*q.v.*), pop. about 15,000, which has taken the place of Obok (*q.v.*), on the opposite (northern) side of the Gulf of Tajura. Also situated on the gulf are the small towns of Tajura, Sagallo, Gobad and Ambabo.

Trade and Communications.—The collection of salt from Bahr-Assal is an industry of some importance. In 1903 a beginning was made in the cultivation of cotton in the dry river beds, where water can always be obtained at a depth of 10 ft. On the coast turtle and mother-of-pearl fishing are carried on. But the value of the protectorate depends upon the carrying trade with Harrar and the supplying of victuals and coals to French warships. In 1897 the building of a railway from Jibuti towards Harrar was begun. By Christmas 1902 the railway, called the Imperial Ethiopian railway, was completed to Dire Dawa (or Adis Harrar), 30 m. short of Harrar, and 188 by rail from Jibuti, of which but 64 m. are in French territory. By a law passed by the French chambers in 1902 a subvention of £20,000 a year for fifty years was granted to the company owning the railway (see further Abyssinia).

The exports are chiefly coffee, hides, ivory (all from Abyssinia), gum, mother-of-pearl and a little gold; the imports cotton and other

European stuffs, cereals, beverages, tobacco and arms and ammunition for the Abyssinians. The total volume of trade in 1902, the year of the completion of the railway, was £725,000, in 1905 it had risen to £1,208,000—imports £480.000, exports £728,000.

History.—French interest in the Somali and Danakil coasts dates from the days of the Second Empire. Count Stanislas Russell, a naval officer, was sent on a mission to the Red Sea in 1857, and he reported strongly on the necessity of a French establishment in that region in view of the approaching completion of the Suez Canal. The only result of his enterprise was the abortive treaty for the cession to France of Zula (*q.v.*), now in the Italian colony of Eritrea. In 1856, however, M. Monge, vice-consul of France at Zaila, had bought Ambabo, and shortly afterwards Henri Lambert, French consul at Aden, bought the town and territory of Obok. Lambert (who was assassinated by Arabs, June 1859) had the support of his government, which viewed with alarm the establishment (1857) of the British on Perim Island, at the entrance to the Red Sea. The cession of Obok was ratified by a treaty (signed on the 11th of March 1862) between the French government and various Danakil chiefs. It was not, however, until 1883 that, in consequence of events in Egypt and the Sudan (see EGYPT: *History*), formal possession was taken of Obok by the French government. In 1884 Léonce Lagarde, subsequently French minister to Abyssinia, was sent to administer the infant colony. Between 1883 and 1887 treaties with Somali sultans gave France possession of the whole of the Gulf of Tajura. An agreement with Great Britain (February 1888) fixed the southern limits of the protectorate; protocols with Italy (January 1900 and July 1901) the northern limits. The frontier towards Abyssinia was fixed by a convention of March 1897 with the Negus Menelik. In this direction the protectorate extends inland some 56 m. In 1889 a Cossack chief, Captain Atchinoff, who had occupied Sagallo, was forcibly removed by the French authorities (see SAGALLO). The transference of the seat of government to Jibuti in May 1896 and the building of the railway to Harrar gave the protectorate a stability which it had previously lacked. Its importance to France is, nevertheless, chiefly strategic and political. It serves as a coaling station for men-of-war and as a highroad to Abyssinia.

ITALIAN SOMALILAND

Italian Somaliland extends on the coast from Bandar Ziyada, a point on the Gulf of Aden intersected by 49° E., eastward to Cape Guardafui, and thence southward to the mouth of the river Juba in 0° 15′ S. Bounded N. and E. by the Indian Ocean it is separated S. from British East Africa by the Juba. Westward it is bounded by Abyssinian and British Somaliland. From the east coast the protectorate extends inland from 100 to 300 m.

The coast-line is largely rock-bound and little indented, and throughout the 1200 m. of its extent there is not one good harbour. The northern shore, along the Gulf of Aden, is backed by table-lands separated by the beds of mountain torrents—generally dry. From the table-land rise hills, such as Jebel Kurma, which have an altitude of 4000 ft. or more. The coast rises in a succession of hills (fringed by a narrow margin of beach) until Cape Guardafui is reached. Cape Guardafui is in 11° 75′ N., 51° 26′ 32″ E., and forms, as it were, the tip of the Horn of Africa. The cape, which faces north and east, presents on its northern face a nearly vertical wall of rock rising from the sea to a height of 900 ft. The water is deep right to the base of the cliff and owing to the winds and the strength of the ocean currents, navigation is dangerous. The headland is known to the Somali as Girdif or Yardaf—whence in all probability comes the European form Guardafui. But in the *lingua franca* of the Levant the Italian word *guarda* means "beware," a meaning also attached to the Portuguese word *guardafu*.

Rounding Guardafui the coast trends southwards, and some 90 m. from that cape is Ras Hafun or Medudda—the most easterly point of the continent of Africa—being in 10° 45′ S., 51° 27′ 52″ E., or about a mile and a half east of Guardafui. Ras Hafun consists of a rocky peninsula rising 600 ft. above the sea, and is connected with the mainland by an isthmus 12 m. long. A little south is the mouth of the Darror, a usually dry watercourse with a length of over 200 m., which rises, as the Gebi, in the north-east of the British protectorate. From this point a zone of upheaved coral rocks skirts the shore for some distance.

Chief Towns.—The chief towns are on the coast. They are Mukdishu (*q.v.*), pop. about 5000, Brava (4000), Marka (5000), Warsheik (3000) and Yub. These are all in the southern part of the protectorate between 0° 15′ S. and 2° 19′ N., and are known generically as El-Benadir (the ports), a name also applied to the coast between the ports. Yub (Jub) is a small town at the mouth of the Juba river. In every case the port is much exposed and unapproachable for months together. Obbia, 5° 22′ N., and Illig in 7° 60′ N., are points of departure for the Ogaden and Dolbahanta countries. Alula, on the Gulf of Aden, is the chief town of the Mijertin Somali.

In the interior is Lugh, a populous city on the left bank of the Juba, about 240 m. from the coast, and further inland is Dolo at the confluence of the Daua and Ganale to form the Juba. These places are entrepôts for the trade of the interior, especially with the Boran district.

In the coast towns of the eastern seaboard there are Swahili, Arab and Indian settlements, and tribes, such as the Amaran, of mixed Arab and Somali blood.

Agriculture and Trade.—Though much of the land is barren, the soil is fairly fertile in the valleys of the Webi Shebeli and Wadi Nogal. But the most fertile district is the valley of the lower Juba, where for over 100 m. is a strip of land varying from a few hundred yards to some 4 m. wide, annually inundated by the rise of the river. Here are cultivated rich crops of millet and other grains. In other districts lack of water impedes cultivation, though after the rains pasturage is abundant, and resinous plants are so varied and numerous as to justify the ancient name of the region.

Ivory, cattle, butter, coffee, cotton, myrrh, gums and skins are exported from the Benadir country. In the northern ports there is a similar but smaller trade and one also in ostrich feathers. The chief imports are textile fabrics, rice and petroleum. During 1896–1897 the value of the Benadir trade was £120,000; in 1906–1907 it had risen to over £250,000.

History.—The Somali coast, as has been seen, early fell under Moslem influence. The towns on the eastern seaboard, of which Mukdishu and Brava were the chief, formed part of the Zenj "empire" (see ZANZIBAR) and shared its fate, being conquered in turn by the Portuguese (16th century), the imans of Muscat (17th century), and the sultans of Zanzibar (1866). On account, probably, of the inhospitable nature of the shore the northern portion of the protectorate appears to have been little subject to hostile invasion. By treaties with Somali sultans in 1889 and by subsequent agreements with Great Britain, Zanzibar and Abyssinia, the coast east of the British Somali protectorate fell within the Italian sphere of influence (see AFRICA, § 5). In August 1892 the sultan of Zanzibar leased the Benadir ports of Italy for fifty years. They were administered first by the Filonardi Company, and from 1898 by the Benadir Company. By an agreement dated the 13th of January 1905 the sultan of Zanzibar ceded his sovereign rights in the Benadir ports to Italy in return for the payment of a lump sum of £144,000. Thereafter the Italian government assumed the direct administration of the ports, a purely commercial undertaking replacing the Benadir Company. In 1905 also Great Britain leased to Italy a piece of land near Kismayu to facilitate communications with the Benadir country. In 1908 a royal decree placed that part of the country between the Juba and the sultanate of Obbia under a civil governor.

A notable event in the history of the protectorate was the co-operation of the Italian authorities in the campaigns against the Mullah Abdullah. In 1904 negotiations were opened with the mullah by the Italians, and by arrangement with the sultan of Obbia and the sultan of the Mijertins the territory between Ras Aswad and Ras Bowen, which was claimed by both parties, was handed over to the mullah. This region, that of the lower Nogal, included the port of Illig. Here Mahommed b. Abdullah established himself under Italian surveillance, and by an agreement dated the 5th of March 1905, peace was declared between the mullah, the Italians, British and Abyssinians, and all other Somali tribes. In 1908–1909, however, fighting was renewed, the mullah and the Mijertins failing to agree. Italian (native) troops were sent to the district to restore order. The mullah also attacked tribes living in the British protectorate (see § 2).

The station of Lugh, the most advanced point occupied by Italy, had been founded by Captain Bottego in 1895. After the treaty of Adis Adowa, recognizing the independence of Abyssinia, had been concluded in 1896, negotiations were opened for defining the Italian-Abyssinian frontier in the Somali regions. In 1897 an agreement was come to that from the point on the

British Somaliland frontier where 47° E. intersected 8° N. the frontier line should be drawn, at a distance of about 180 m. from the Indian Ocean, to the Juba. At the close of 1907 the Negus Menelik, in return for a pecuniary indemnity (£120,000), agreed to a modification of the 1897 line, whereby the Italian protectorate was extended north of Lugh to Dolo. From Dolo the frontier goes east to the Webi Shebeli, whence the 1897 line is followed to the British-Abyssinian frontier. By this arrangement (ratified by a convention dated the 16th of May 1908) the Benadir coast obtained a suitable hinterland.

SOMBRERO, a wide-brimmed hat, made of felt, largely worn throughout South and Central America, but originating in Spain. The Spanish word is derived from *sombra*, shade, generally taken to be from Lat. *sub umbra*, beneath the shade; but the etymology, like that of "sombre," dark, gloomy, has been disputed.

SOMERS, JOHN SOMERS (or Sommers), Baron (1651–1716), English lord chancellor, was born on the 4th of March 1651, near Worcester, the eldest son of John Somers, an attorney in large practice in that town, who had formerly fought on the side of the Parliament, and of Catherine Ceaverne of Shropshire. After being at school at Worcester he was entered as a gentleman commoner at Trinity College, Oxford, and afterwards studied law under Sir Francis Winnington, who became solicitor-general, and joined the Middle Temple. He appears, in addition to his legal studies, to have written several poems and pamphlets. He soon became intimate with the leaders of the country party, especially with Essex, William Russell, and Algernon Sidney, but never entered into their plans so far as to commit himself beyond recall. He was the author of the *History of the Succession of the Crown of England, collected out of Records*, &c., and was reputed to have written the *Just and Modest Vindication of the Two Last Parliaments*, which was put forward as the answer to Charles II.'s famous declaration of his reasons for dissolving them. This, however, was by Sidney, though probably Somers was responsible for the final draft. When the grand jury of Middlesex threw out the bill against Shaftesbury, and were vehemently attacked for so doing, Somers wrote in defence of the rights of grand juries. In 1683 he was counsel for the sheriffs Pilkington and Shute before the court of King's Bench, and secured a reputation which continually increased until the trial of the seven bishops, in which he was junior counsel. "Somers rose last. He spoke little more than five minutes, but every word was full of weighty matter; and when he sat down his reputation as an orator and a constitutional lawyer was established." In the secret councils of those who were planning the revolution Somers took a leading part, and in the Convention Parliament was elected a member for his native town. He was immediately appointed one of the managers for the Commons in the conferences between the houses, and in arguing the questions whether James II. had left the throne vacant by abdication and whether the acts of the Convention Parliament were legal—that parliament having been summoned without the usual writs—he displayed great learning and legal subtlety. He was further distinguished by being made chairman of the committee which drew up the celebrated Declaration of Right.

In May 1689 Somers was made solicitor-general. He now became William III.'s most confidential adviser. In the controversy which arose between the Houses on the question of the legality of the decision of the court of King's Bench regarding Titus Oates, and of the action of the Lords in sustaining this decision, Somers was again the leading manager for the Commons, and has left a clear and interesting account of the debates. He was next employed in January 1690 as chairman of the select committee of the House of Commons on the Corporation Bill, by which those corporations which had surrendered their charters to the Crown during the last two reigns were restored to their rights; but he refused to associate himself with the violent measures of retaliation which the Whigs on that occasion endeavoured to include in the bill. In April a speech by him carried through the lower house, without opposition, the bill which declared all the laws passed by the Convention Parliament to be valid. As solicitor-general he had to conduct the prosecution of Preston and Ashton in 1691, and did so with a moderation and humanity which were in marked contrast to the customs of the former reigns. He was soon after appointed attorney-general, and in that capacity strongly opposed the bill for the regulation of trials in cases of high treason. On the 23rd of March 1693, the great seal having meanwhile been in commission, Somers was appointed lord-keeper, with a pension of £2000 a year from the day on which he should quit his office, and at the same time was made a privy councillor. He had previously been knighted. Somers now became the most prominent member of the Junto, the small council which comprised the chief members of the Whig party. When William left in May 1695 to take command of the army in the Netherlands, Somers was made one of the seven lords-justices to whom the administration of the kingdom during his absence was entrusted; and he was instrumental in bringing about a reconciliation between William and the princess Anne.

In April 1697 Somers was made lord chancellor, and was created a peer by the title of Baron Somers of Evesham. When the discussion arose on the question of disbanding the army, he summed up the case against disbanding, in answer to Trenchard, in a remarkable pamphlet called "The Balancing Letter." In August 1698 he went to Tunbridge Wells for his health. While there he received the king's letter announcing the first Partition Treaty, and at once replied with a memorandum representing the necessity in the state of feeling in England of avoiding further war. When the king, on the occasion of the Disbanding Bill, expressed his determination to leave the country, Somers boldly remonstrated, while he clearly expressed in a speech in the Lords the danger of the course that was being taken. Hitherto Somers's character had kept him free from attack at the hands of political opponents; but his connexion in 1699 with the notorious Captain William Kidd, to the cost of whose expedition Somers had given £1000, afforded an opportunity; the vote of censure, however, proposed upon him in the House of Commons for giving Kidd a commission under the great seal was rejected by 199 to 131. The attack was renewed shortly on the ground of his having accepted grants of Crown property to the amount of £1600 a year, but was again defeated. On the subject of the Irish forfeitures a third attack was made in 1700, a motion being brought forward to request the king to remove Somers from his counsels and presence for ever; but this again was rejected by a large majority. In consequence, however, of the incessant agitation William now requested Somers to resign; this he refused to do, but gave up the seals to William's messenger. In 1701 he was impeached by the Commons on account of the part he had taken in the negotiations relating to the Partition Treaty in 1698, and defended himself most ably before the house, answering the charges seriatim. The impeachment was voted and sent up to the Lords, but was there dismissed. On the death of the king Somers retired almost entirely into private life. He was president of the Royal Society from 1699 to 1704. He was, however, active in 1702 in opposing the Occasional Conformity Bill, and in 1706 was one of the managers of the union with Scotland. In the same year he carried a bill regulating and improving the proceedings of the law courts. He was made president of the council in 1708 upon the return of the Whigs to power, and retained the office until their downfall in 1710. He died on the 26th of April 1716. Somers was never married, but left two sisters, of whom the eldest, Mary, married Charles Cocks, whose grandson, Sir Charles Cocks, bart., became the second Lord Somers in 1784, the title subsequently descending in this line.

For a contemporary character of Somers Addison's paper in the *Freeholder* for the 14th of May 1716 should be referred to; and there is in Macaulay's *History* (iv. 53) an eloquent and worthy tribute to his stainless character and comprehensive learning. A catalogue of his publications will be found in Walpole's *Royal and Noble Authors*. (O. A.)

SOMERSET, EARLS AND DUKES OF. In the 11th century Somerset and Dorset were under the jurisdiction of one sheriff, and for a considerable period titles derived from each of these shires were borne by the same person. (See DORSET, EARLS, MARQUESSES AND DUKES OF.)

The earldom of Somerset in the Beaufort family dated from 1397, in which year it was granted by Richard II. to John Beaufort (*c.* 1373–1410), the eldest of the three illegitimate, but afterwards legitimated, sons of John of Gaunt, duke of Lancaster, by Catherine, wife of Sir Hugh Swynford, and daughter of Sir Payne Roelt. He was followed in the earldom successively by his three sons: Henry, who died unmarried in 1418; John (1404–1444), who in 1443 was created earl of Kendal and duke of Somerset, both of which titles became extinct at his death; and Edmund, who was created earl of Dorset in 1441, marquess of Dorset in 1443, and duke of Somerset in 1448. (See SOMERSET, EDMUND BEAUFORT, DUKE OF.) On the execution of Edmund's son Henry, 5th earl and 2nd duke of Somerset, by the Yorkists in 1464, his titles were forfeited by act of parliament; but his brother Edmund was from that date styled duke of Somerset by the Lancastrian party till his death in May 1471, when the house of Beaufort became extinct. (See BEAUFORT.) In 1499 Henry VII. nominated his infant son Edmund to the dukedom of Somerset at his baptism, but the child, who died within a few months, was probably never formally created a peer; the title, conjoined with the dukedom of Richmond, was, however, borne by Henry Fitzroy, illegitimate son of Henry VIII., from 1525 till his death without heirs in 1536.

EDWARD SEYMOUR, duke of Somerset (*q.v.*), known as the Protector, was the first of the line of dukes to which the holder of the title at the present day belongs, having been created Viscount Beauchamp of Hache, Co. Somerset, in 1536; earl of Hertford in 1537; and in 1547 Baron Seymour and duke of Somerset. His honours, which were entailed on the issue of his second in priority to that of his first marriage, being forfeited by attainder in 1552, Robert Carr became earl of Somerset (*q.v.*) in 1613, but died without male issue in 1645, when his title became extinct. A curious incident in the history of this title was the grant by Charles I. in 1644 of a commission to Edward Somerset, son of Henry, 1st marquess of Worcester, empowering him to fill up certain blank patents of peerage with a promise of the title of duke of Somerset for himself. After the Restoration this instrument was cancelled in consequence of a resolution of the House of Lords declaring it to be "in prejudice to the peers"; and the grantee, who had meantime succeeded to the marquessate of Worcester, surrendered his claim to the dukedom of Somerset in September 1660. In the same month the dukedom of Somerset and barony of Seymour were restored to William Seymour (1588–1660), great-grandson of the Protector, who in 1621 inherited the titles of earl of Hertford and Baron Beauchamp which had been granted to his grandfather Edward Seymour in 1559, and who, in 1640, had himself been created marquess of Hertford. This nobleman, who in early life had incurred the displeasure of James I. by marrying the king's cousin, Lady Arabella Stuart, and had been imprisoned in the Tower for the offence, had later an exceptional claim on the gratitude of the royal house of Stewart, for he fought with distinction on the royalist side in the civil war, and was one of four lords (the others being the duke of Richmond, and the earls of Lindsey and Southampton) who petitioned the Commons to be allowed to assume responsibility for the actions of Charles I. and to suffer death in his place. He died in November 1660, a few weeks after his restoration to the dukedom, and, having outlived his three eldest sons, was succeeded by his grandson William, 3rd duke of Somerset (*c.* 1651–1671). As the latter died unmarried, his sister Elizabeth brought to her husband, Thomas Bruce, 2nd earl of Ailesbury, the great estates of Tottenham Park and Savernake Forest in Wiltshire; while the Somerset title devolved on John Seymour (*c.* 1628–1675), the 2nd duke's fifth and youngest son. At the death of the latter without issue in April 1675 the marquessate of Hertford became extinct, and his cousin Francis Seymour (1658–1678) became 5th duke of Somerset. This nobleman was the eldest surviving son of Charles Seymour, 2nd Baron Seymour of Trowbridge, whose father Sir Francis Seymour (*c.* 1590–1664), a younger brother of the 2nd duke of Somerset, was created a baron in 1641.

CHARLES SEYMOUR, 6th duke of Somerset (1662–1748), succeeded his brother Francis, the 5th duke, when the latter was shot in 1678 at the age of twenty, by a Genoese gentleman named Horatio Botti, whose wife Somerset was said to have insulted at Lerici. Charles, who thus inherited the barony of Seymour of Trowbridge along with the dukedom of Somerset, was educated at Trinity College, Cambridge; and in 1682 he married a great heiress, Elizabeth, daughter of Joceline Percy, earl of Northumberland, who brought him immense estates, including Alnwick Castle, Petworth, Syon House and Northumberland House in London. (See NORTHUMBERLAND, EARLS AND DUKES OF.) In 1683 Somerset received an appointment in the king's household, and two years later a colonelcy of dragoons; but at the revolution he bore arms for the prince of Orange. Having befriended Princess Anne in 1692, he became a great favourite with her after her accession to the throne, receiving the post of master of the horse in 1702. Finding himself neglected by Marlborough, he made friends with the Tories, and succeeded in retaining the queen's confidence, while his wife replaced the duchess of Marlborough as mistress of the robes in 1711. In the memorable crisis when Anne was at the point of death, Somerset acted with Argyll, Shrewsbury and other Whig nobles who, by insisting on their right to be present in the privy council, secured the Hanoverian succession to the Crown. He retained the office of master of the horse under George I. till 1716, when he was dismissed and retired into private life; he died at Petworth on the 2nd of December 1748. The duke's first wife having died in 1722, he married secondly, in 1726, Charlotte, daughter of the 2nd earl of Nottingham. He was a remarkably handsome man, and inordinately fond of taking a conspicuous part in court ceremonial; his vanity, which earned him the sobriquet of "the proud duke," was a byword among his contemporaries and was the subject of numerous anecdotes; Macaulay's description of him as "a man in whom the pride of birth and rank amounted almost to a disease," is well known. His son Algernon (1684–1750), by his first wife Elizabeth Percy, was called to the House of Lords as Baron Percy in 1722; and after succeeding his father as 7th duke of Somerset in 1748, was, on account of his maternal descent, created Baron Warkworth and earl of Northumberland in 1749, with remainder to Sir Hugh Smithson, husband of his daughter Elizabeth; and also Baron Cockermouth and earl of Egremont, with remainder to the children of his sister, Lady Catherine Wyndham. At his death without male issue in February 1750 these titles therefore passed to different families in accordance with the remainders in the patents of their creation; the earldom of Hertford, the barony of Beauchamp, and the barony of Seymour of Trowbridge became extinct; and the dukedom of Somerset, together with the barony of Seymour, devolved on a distant cousin, Sir Edward Seymour, 6th baronet of Berry Pomeroy, Devonshire. (See SEYMOUR, or ST MAUR.)

The Seymours of Berry Pomeroy were the elder branch of the family, being descended from the protector Somerset by his first marriage, the issue of which had been excluded from succession to the titles and estates until after the failure of the issue of his second marriage (see above), which failure occurred on the death of the above-named Algernon, 7th duke. Sir Edward Seymour (1695–1757), who thus became 8th duke of Somerset, was grandson of Sir Edmund Seymour, Speaker of the House of Commons in the reign of Charles II. His two sons succeeded in turn to the dukedom, and his grandson Edward Adolphus, 11th duke (1775–1855), was a mathematician and scientist of some distinction. The latter's son Edward Adolphus, 12th duke (1804–1885), was educated at Eton and Christ Church, Oxford, and from 1830 till he succeeded to the peerage in 1855 he was a Liberal member of the House of Commons as Lord Seymour, first for Okehampton, and afterwards for Totnes. He held various offices in Lord Melbourne's administration from 1835 to 1841; was a member of Lord John Russell's cabinet in 1851; and first lord of the admiralty from 1859 to 1866. In 1863 he was created Earl St Maur of Berry Pomeroy. He refused to join W. E. Gladstone's ministry in 1868, but he gave independent support to the chief measures of the government. He died in November 1885. In 1830, while still Lord Seymour, he married Jane Georgiana, youngest of the three celebrated daughters of Thomas Sheridan, who was the "Queen of Beauty" at the famous Eglinton Tournament in 1839. The duke was the author of *Christian Theology and Modern Scepticism* (1872), and *Monarchy and Democracy* (1880). As his two sons both died unmarried in his lifetime, the family titles, except the earldom of St Maur, which became extinct, devolved on his two brothers successively; the younger of whom, Algernon Percy Banks, 14th duke (1813–1894), was succeeded by his son Algernon (b. 1846) as 15th duke of Somerset.

The title of Earl St Maur adopted by the 12th duke in 1863 is said to have been the original form of the family name of which Seymour was a later corruption, and since the last-mentioned date it has been assumed as the family surname of the dukes of Somerset.

See SEYMOUR, or ST MAUR, and the authorities there cited.

(R. J. M.)

SOMERSET, EDMUND BEAUFORT, DUKE OF (*c.* 1404–1455), was the younger son of John, earl of Somerset, and grandson of John of Gaunt, duke of Lancaster. He was taken prisoner at Baugé in 1421 during his first campaign, and did not return to England till 1431. He was then styled earl of Mortain, and in 1432 was one of the envoys to the council of Basel. In 1436 he served at the relief of Calais, two years later he commanded with some success in Maine, and in 1440 recovered Harfleur. Next year he was made earl, and in 1443 marquess of Dorset. In 1444 on the death of his elder brother he became duke of Somerset. As head of the Beaufort party he was the rival of Richard of York, whom in 1446 he superseded as lieutenant of France. He lacked statesmanship, and as a general could do nothing to stop French successes. The loss of Rouen and Normandy during the next four years was precipitated by his incompetence, and his failure naturally made him a special object of Yorkist censure. The fall of Suffolk left Somerset the chief of the king's ministers, and the Commons in vain petitioned for his removal in January 1451. In spite of York's active hostility he maintained his position till Henry's illness brought his rival the protectorate in March 1454. For a year he was kept a prisoner in the Tower "without any lawful process." On the king's recovery he was honourably discharged, and restored to his office as captain of Calais. Mistrust of Somerset was York's excuse for taking up arms. The rivalry of the two leaders was ended by the defeat of the Lancastrians and death of Somerset at St Albans on the 22nd of May 1455. Though loyal to his family, Somerset was without capacity as a leader. It was a misfortune for Henry VI. that circumstances should have made so weak a man his chief minister. Thomas Basin, the French chronicler, describes Somerset as a handsome, courteous and kindly man. By his wife, Eleanor, daughter and co-heiress of Richard Beauchamp, earl of Warwick, he had two sons, Henry and Edmund, who were executed by Edward IV. after the battles of Hexham and Tewkesbury.

For further information see Sir James Ramsay's *Lancaster and York* (Oxford, 1892), and C. Oman's *Political History of England, 1377–1485* (1906), with authorities there cited. (C. L. K.)

SOMERSET, EDWARD SEYMOUR, DUKE OF (*c.* 1506–1552), protector of England, born about 1506, was the eldest surviving son of Sir John Seymour of Wolf Hall, Wiltshire, by his wife Margaret, eldest daughter of Sir Henry Wentworth of Nettlested, Suffolk. The Seymours claimed descent from a companion of William the Conqueror, who took his name from St Maur-sur-Loire in Touraine; and the protector's mother was really descended from Edward III. His father was knighted by Henry VII. for his services against the Cornish rebels at Blackheath in 1497, was present at the two interviews between Henry VIII. and Francis I. in 1520 and 1532, and died on the 21st of December 1536. Edward was "enfant d'honneur" to Mary Tudor at her marriage with Louis XII. in 1514, served in Suffolk's campaign in France in 1523, being knighted by the duke at Roze on the 1st of November, and accompanied Wolsey on his embassy to France in 1527. Appointed esquire of the body to Henry VIII. in 1529, he grew in favour with the king, who visited his manor at Elvetham in Hampshire in October 1535. On the 5th of June 1536, a week after his sister Jane's marriage to Henry, he was created Viscount Beauchamp of Hache in Somerset, and a fortnight after Edward VI.'s birth in October 1537, he was raised to the earldom of Hertford.

Queen Jane's death was a blow to his prospects, and in 1538 he was described as being "young and wise" but of "small power." He continued, however, to rise in political importance. In 1541, during Henry's absence in the north, Hertford, Cranmer and Audley had the chief management of affairs in London; in September 1542 he was appointed warden of the Scottish marches, and a few months later lord high admiral, a post which he almost immediately relinquished in favour of the future duke of Northumberland (*q.v.*). In March 1544 he was made lieutenant-general of the north and instructed to punish the Scots for their repudiation of the treaty of marriage between Prince Edward and the infant Mary Queen of Scots. He landed at Leith in May, captured and pillaged Edinburgh, and returned a month later. In July he was appointed lieutenant of the realm under the queen regent during Henry's absence at Boulogne, but in August he joined the king and was present at the surrender of the town. In the autumn he was one of the commissioners sent to Flanders to keep Charles V. to the terms of his treaty with England, and in January 1545 he was placed in command at Boulogne, where on the 26th he brilliantly repelled an attempt of Marshal de Biez to recapture the town. In May he was once more appointed lieutenant-general in the north to avenge the Scottish victory at Ancrum Moor; this he did by a savage foray into Scotland in September. In March 1546 he was sent back to Boulogne to supersede Surrey, whose command had not been a success; and in June he was engaged in negotiations for peace with France and for the delimitation of the English conquests. From October to the end of Henry's reign he was in attendance on the king, engaged in that unrecorded struggle for predominance which was to determine the complexion of the government during the coming minority. Personal, political and religious rivalry separated him and Lisle from the Howards, and Surrey's hasty temper precipitated his own and his father's ruin. They could not acquiesce in the Imperial ambassador's verdict that Hertford and Lisle were the only noblemen of fit age and capacity to carry on the government; and Surrey's attempt to secure the predominance of his family led to his own execution and to his father's imprisonment in the Tower.

Their overthrow had barely been accomplished when Henry VIII. died on the 28th of January 1547. Preparations had already been made for a further advance in the ecclesiastical reformation and for a renewal of the design upon Scotland; and the new government to some extent proceeded on the lines which Chapuys anticipated that Henry VIII. would have followed had he lived. He had no statutory power to appoint a protector, but in the council of regency which he nominated Hertford and Lisle enjoyed a decisive preponderance; and the council at its first meeting after Henry's death determined to follow precedent and appoint a protector. Hertford was their only possible choice; he represented the predominant party, he was Edward VI.'s nearest relative, he was senior to Lisle in the peerage and superior to him in experience. Seven weeks later, however, after Lord-Chancellor Wriothesley, the leading Catholic, had been deprived of office Hertford, who had been made duke of Somerset, succeeded in emancipating himself from the trammels originally imposed on him as protector; and he became king in everything but name and prestige.

His ideas were in striking contrast with those of most Tudor statesmen, and he used his authority to divest the government of that apparatus of absolutism which Thomas Cromwell had perfected. He had generous popular sympathies and was by nature averse from coercion. "What is the matter, then?" wrote Paget in the midst of the commotions of 1549, "By my faith, sir, . . . liberty, liberty. And your grace would have too much gentleness." In his first parliament, which met in November 1547, he procured the repeal of all the heresy laws and nearly all the treason laws passed since Edward III. Even with regard to Scotland he had protested against his instructions of 1544, and now ignored the claim to suzerainty which Henry VIII. had revived, seeking to win over the Scots by those promises of autonomy, free trade, and equal privileges with England, which many years later eventually reconciled them to union. But the Scots were not thus to be won in 1547: "What would you say," asked one, "if your lad were a lass, and our lass were a lad?" and Scottish sentiment backed by Roman Catholic influence and by French intrigues, money and men, proved too strong for Somerset's amiable invitations. The Scots turned a deaf ear to his persuasions; the protector led another army into Scotland in September 1547, and won the battle of Pinkie (Sept. 10). He trusted to the garrisons he established throughout the Lowlands to wear down Scottish opposition; but their pressure was soon weakened by troubles in England and abroad, and Mary was transported to France to wed Francis II. in 1557.

Somerset apparently thought that the religious question could be settled by public discussion, and throughout 1547 and 1548 England went as it pleased so far as church services were concerned; all sorts of experiments were tried, and the country was involved in a grand theological debate, in which Protestant refugees from abroad hastened to join. The result convinced the protector that the government must prescribe one uniform order which all should be persuaded or constrained to obey; but the first Book of Common Prayer, which was imposed by the first Act of Uniformity in 1549, was a studious compromise between the new and the old learning, very different from the aggressive Protestantism of the second book imposed after Somerset had been removed, in 1552. The Catholic risings in the west in 1549 added to Somerset's difficulties, but were not the cause of his fall. The factious and treasonable conduct of his brother, the lord high admiral, in whose execution (March 20, 1549) the protector weakly acquiesced, also impaired his authority; but the main cause of his ruin was the divergence between him and the majority of the council over the questions of constitutional liberty and enclosures of the commons. The majority scouted Somerset's notions of liberty and deeply resented his championship of the poor against greedy landlords and capitalists. His efforts to check enclosures by means of parliamentary legislation, royal proclamations, and commissions of inquiry were openly resisted or secretly foiled, and the popular revolts which their failure provoked cut the ground from Somerset's feet. He was divided in mind between his sympathy with the rebels and his duty to maintain law and order. France, which was bent on ruining the protector's schemes in Scotland and on recovering Boulogne, seized the opportunity to declare war on August the 8th; and the outlying forts in the Boulonnais fell into their hands, while the Scots captured Haddington.

These misfortunes gave a handle to Somerset's enemies. Warwick combined on the same temporary platform Catholics who resented the Book of Common Prayer, Protestants who thought Somerset's mildness paltering with God's truth, and the wealthy classes as a whole. In September he concerted measures with the ex-lord-chancellor Wriothesley; and in October, after a vain effort to rouse the masses in his favour, Somerset was deprived of the protectorate and sent to the Tower. But the hostile coalition broke up as soon as it had to frame a constructive policy; Warwick jockeyed the Catholics out of the council and prepared to advance along Protestant lines. He could hardly combine proscription of the Catholics with that of Somerset, and the duke was released in February 1550. For a time the rivals seemed to agree, and Warwick's son married Somerset's daughter. But growing discontent with Warwick made Somerset too dangerous. In October 1551, after Warwick had been created duke of Northumberland, Somerset was sent to the Tower on an exaggerated charge of treason, which broke down at his trial. He was, however, as a sort of compromise, condemned on a charge of felony for having sought to effect a change of government. Few expected that the sentence would be carried out, and apparently Northumberland found it necessary to forge an instruction from Edward VI. to that effect. Somerset was executed on the 22nd of January 1552, dying with exemplary patience and fortitude. His eldest son by his second wife was re-created earl of Hertford by Elizabeth, and his great-grandson William was restored as 2nd duke of Somerset in 1660. His children by his first wife had been disinherited owing to the jealousy of his second; but their descendants came into the titles and property when the younger line died out in 1750.

See A. F. Pollard's *England Under Protector Somerset* (1900; full bibliography, pp. 327–339), also his article in *Dict. Nat. Biog.* and vol. vi. of *Political History of England* (1910). (A. F. P.)

SOMERSET, ROBERT CARR (or Ker), Earl of (*c.* 1590–1645), Scottish politician, the date of whose birth is unrecorded, was a younger son of Sir Thomas Ker of Ferniehurst by his second wife, Janet, sister of Sir Walter Scott of Buccleuch. He accompanied James I. as page to England, but being then discharged from the royal service, sought for a time to make his fortune in France. Returning to England he happened to break his arm at a tilting match, at which James was present, and was recognized by the king. Entirely devoid of all high intellectual qualities, Carr was endowed with good looks, excellent spirits, and considerable personal accomplishments. These advantages were sufficient for James, who knighted the young man and at once took him into favour. In 1607 an opportunity enabled the king to confer upon him a more substantial mark of his affection. Sir W. Raleigh had through his attainder forfeited his life-interest in the manor of Sherborne, but he had previously executed a conveyance by which the property was to pass on his death to his eldest son. This document was, unfortunately, rendered worthless by a flaw which gave the king eventual possession of the property. Acting on Salisbury's suggestion, James resolved to confer the manor on Carr. The case was argued at law, and judgment was in 1609 given for the Crown. Lady Raleigh received some compensation, apparently inadequate, and Carr at once entered on possession. His influence was already such that in 1610 he persuaded the king to dissolve the parliament, which had shown signs of attacking the Scottish favourites. On the 25th of March 1611 he was created Viscount Rochester, and subsequently a privy councillor, while on Lord Salisbury's death in 1612 he began to act as the king's secretary. On the 3rd of November 1613 he was advanced to the earldom of Somerset, on the 23rd of December was appointed treasurer of Scotland, and in 1614 lord chamberlain. He supported the earl of Northampton and the Spanish party in opposition to the old tried advisers of the king, such as Lord-Chancellor Ellesmere, who were endeavouring to maintain the union with the Protestants abroad, and who now in 1614 pushed forward another candidate for the king's favour. Somerset, whose head was turned by the sudden rise to power and influence, became jealous and peevish, and feeling his position insecure, obtained in 1615 from the king a full pardon, to which, however, the chancellor refused to put the Great Seal. He still, however, retained the king's favour, and might possibly have remained in power for some time longer but for the discovery of the murder of Sir Thomas Overbury. Before 1609, while still only Sir Robert Carr, Somerset had begun an intrigue with Lady Essex. Supported by the king, the latter obtained a decree of nullity of marriage against Lord Essex in September 1613, and in December she married the earl of Somerset. Ten days before the court gave judgment, Sir Thomas Overbury, who apparently knew facts concerning Lady Essex which would have been fatal to her success, and had been imprisoned in the Tower, was poisoned. No idea seems to have been entertained at the time that Lady Essex and her future husband were implicated. The crime, however, was not disclosed till September 1615. Coke and Bacon were set to unravel the plot. After four of the principal agents had been convicted and punished, the earl and countess were brought to trial. The latter confessed, and of her guilt there can be no doubt. Somerset's share is far more difficult to discover, and probably will never be fully known. The evidence against him rested on mere presumption, and he consistently declared himself innocent. Probabilities are on the whole in favour of the hypothesis that he was not more than an accessory after the fact. James, who had been threatened by Somerset with damaging disclosures, let matters take their course, and both earl and countess were found guilty. The sentence was not carried into effect against either culprit. The countess was pardoned immediately, but both remained in the Tower till January 1622. The earl appears to have refused to buy forgiveness by concessions, and it was not till 1624 that he obtained his pardon. He only once more emerged into public view when in 1630 he was prosecuted in the Star Chamber for communicating a paper of Sir Robert Dudley's to the earl of Clare, recommending the establishment of arbitrary government. He died in July 1645, leaving one daughter, Anne, the sole issue of his ill-fated marriage, afterwards wife of the 1st duke of Bedford.

See the article by S. R. Gardiner in *Dict. Nat. Biog.*, with authorities there cited, and the same author's *History of England; State Trials* II.; *Life and Letters of Bacon*, ed. by Spedding; *Studies in Eng. Hist.*, by Gairdner and Spedding.

SOMERSET, LORD ROBERT EDWARD HENRY (1776–1842), British soldier, was the third son of the 5th duke of Beaufort, and elder brother of Lord Raglan. Joining the 15th Light Dragoons in 1793, he became captain in the following year, and received a majority after serving as aide-de-camp to the duke of York in the Dutch expedition of 1799. At the end of 1800 he became a lieutenant-colonel, and in 1801 received the command of the 4th Light Dragoons. From 1799 to 1802 he represented the Monmouth boroughs in the House of Commons, and from 1803 to 1823 sat for Gloucestershire. He commanded his regiment at the battles of Talavera and Busaco, and in 1810 received a colonelcy and the appointment of A.D.C. to the king. In 1811, along with the 3rd Dragoon Guards, the 4th Light Dragoons fought a notable cavalry action at Usagre, and in 1812 Lord Edward Somerset was engaged in the great charge of Le Marchant's heavy cavalry at Salamanca. His conduct on this occasion (he captured five guns at the head of a single squadron) won him further promotion, and he made the remaining campaigns as a major-general at the head of the Hussar brigade (7th, 10th and 15th Hussars). At Orthes he won further distinction by his pursuit of the enemy; he was made K.C.B., and received the thanks of parliament. At Waterloo he was in command of the Household Cavalry Brigade, which distinguished itself not less by its stern and patient endurance of the enemy's fire than by its celebrated charge on the cuirassiers of Milhaud's corps. The brigadier was particularly mentioned in Wellington's despatches, and received the thanks of parliament as well as the Maria Theresa and other much-prized foreign orders. He died a general and G.C.B. in 1842.

SOMERSETSHIRE, a south-western county of England, bounded N. and N.W. by the Bristol Channel, N. and N.E. by Gloucestershire, N.E. and E. by Wiltshire, S.E. by Dorsetshire, S.W. and W. by Devonshire. The area is 1630·3 sq. m. In shape the county resembles an ill-drawn crescent, curving inward where Bridgwater Bay bends south-west and broader at its eastern than at its western horn. It falls into three natural divisions, being in fact a broad alluvial plain bordered by two hill-regions. The Mendip range, breaking off from the high ground near Wiltshire, extends north-west towards the channel, where it ends with Brean Down; while the island of Steep Holm stands as an outpost between the heights of Somerset and Glamorgan. The summit of the Mendips is a long table-land, reaching an extreme height, towards the western end, of 1068 ft. in Black Down, sloping away gently towards the lower hills of the north, but rising on the south in an abrupt line, broken by many coombes or glens; the most striking of which are the cliffs of Ebbor Rocks, near Wells, and the gorge of Cheddar (*q.v.*), which winds for nearly a mile between huge and fantastic rocks. South of the Mendips lies a broad plain watered by the Parrett and the Brue, and known generally as Sedgemoor, but with different names in different parts. This plain, intersected by ditches known as *rhines*, and in some parts rich in peat, is broken by isolated hills and lower ridges, of which the most conspicuous are Brent Knoll near Burnham, the Isle of Avalon, rising with Glastonbury Tor as its highest point, and the long low ridge of Polden ending to the west in a steep bluff. West of Sedgemoor the second great region of hills extends from Devonshire to the sea. It consists of the Black Down, Brendon and Quantock hills, with Exmoor Forest (*q.v.*) in the extreme west. This entire district is famous for the grandeur of its bare and desolate moors, and the bold outlines and height of its mountains; the chief of which are Dunkery, in Exmoor (1707 ft.); Lype Hill, the westernmost point of the Brendon range (1391 ft.); and Will's Neck, among the Quantocks (1261 ft.). The two principal rivers of Somerset are the Avon and the Parrett. The Avon, after forming for a short distance the boundary with Wiltshire, crosses the north-eastern corner of the county, encircling Bath, and forms the boundary with Gloucestershire till it reaches the sea 6 m. beyond Bristol. It is navigable for barges as far as Bath. The Parrett from South Perrott in Dorset, on the borders of Somerset, crosses the centre of the county north-westwards by Bridgwater, receiving the Yeo and Cary on the right, and the Isle and Tone on the left. Among other streams are the Axe, which rises at Wookey Hole in the Mendips and flows north-westward along their base to the Bristol Channel near Blackrock; the Brue, which rises to the east of Bruton, near the borders of Wiltshire, and enters the Bristol Channel near the mouth of the Parrett; and the Exe (with its tributary the Barle), which rises in Exmoor forest and passes southward into Devon. Some of the Somersetshire streams, especially the Exe and Barle, are in high favour with trout fishermen. Weston-super-Mare is a flourishing seaside resort, and Minehead and other coast villages are also frequented.

Geology.—The oldest formation in the county is the Devonian, which extends eastwards from Devonshire across Exmoor to the Brendon and Quantock hills, and consists of sandstones, slates and limestones of marine origin. The Old Red Sandstone, the supposed estuarine or lacustrine equivalent of the Devonian, is a series of red sandstones, marls and conglomerates, which rise as an anticline in the Mendips (where they contain volcanic rocks), and also appear in the Avon gorge and at Portishead. The Carboniferous Limestone, of marine origin, is well displayed in the Mendip country (Cheddar Cliffs, &c.) and in the Avon gorge; at Weston-super-Mare it contains volcanic rocks. The Coal Measures of the Radstock district (largely concealed by Trias and newer rocks) consist of two series of coal-bearing sandstones and shales separated by the Pennant Sandstone; locally the beds have been intensely folded and faulted, as at Vobster. Indeed, all the formations hitherto mentioned were folded into anticlines and synclines before the deposition of the Triassic rocks. These consist of red marls, sandstones, breccias and conglomerates, which spread irregularly over the edges of the older rocks; the so-called Dolomitic Conglomerate is an old shingle-beach of Triassic (Keuper Marl) age. The Rhaetic beds are full of fossils and mark the first invasion of the district by the waters of the Jurassic sea. The Lias consists of clays and limestones; the latter are quarried and are famous for their ammonites and reptilian remains. Above the Lias comes the Lower or Bath Oolite Series (Inferior Oolite group, Fuller's Earth and Great Oolite group), chiefly clays and oolitic limestone; the famous Bath Stone is got from the Great Oolite. The Oxford Clay is the chief member of the Middle or Oxford Oolite Series. Above these follow the Upper Cretaceous rocks, including the Gault, Upper Greensand and Chalk, which extend into the county from Wiltshire near Frome and from Dorset near Chard. There are apparently no true glacial deposits. Low-lying alluvial flats and peat-bogs occupy much of the surface west of Glastonbury. Caves in the Carboniferous Limestone (*e.g.* Wookey Hole, near Wells) have yielded Pleistocene mammalia and palaeolithic implements. The thermal waters of Bath (120° F.) are rich in calcium and sodium sulphates, &c. The chief minerals are coal, freestone and limestone, and ores of lead, zinc and iron.

Agriculture.—The climate partakes of the mildness of the south-western counties generally. A high proportion, exceeding four-fifths of the total area of the county, is under cultivation. In a county where cattle-feeding and dairy-farming are the principal branches of husbandry, a very large area is naturally devoted to pasture; and there are large tracts of rich meadow land along the rivers, where many of the Devonshire farmers place their herds to graze. Floods, however, are common, and the Somerset Drainage Act was passed by parliament on the 11th of June 1877, providing for the appointment of commissioners to take measures for the drainage of lands in the valleys of the Parrett, Isle, Yeo, Brue, Axe, Cary and Tone. Cheese is made in various parts, notably the famous Cheddar Cheese, which is made in the farms lying south of the Mendips. Sheep-farming is practised both in the lowlands and on hill pastures, Leicesters and Southdowns being the favourite breeds. In the Vale of Taunton heavy crops of wheat are raised; this grain, barley and oats being raised on about equal areas. Turnips, swedes and mangolds occupy most of the area under green crops. Somerset ranks after Devon and Hereford in the extent of its apple orchards, and the cider made from these apples forms the common drink of the peasantry, besides being largely exported. Wild deer are still found on Exmoor, where there is a peculiar breed of ponies, hardy and small. The Bristol Channel and Bridgwater Bay abound in white- and shell-fish; salmon and herring are also caught, the principal fishing stations being Porlock, Minehead and Watchet.

Other Industries.—Coal, from the Mendips, and freestone, largely quarried near Bath, are the chief mineral products of Somerset, although brown ironstone, zinc, limestone and small quantities of slate, gravel, sand, sulphate of strontia, gypsum, ochre Fuller's earth, marl, cement, copper and manganese are also found. Lead mining is carried on near Wellington, and lead washing in the Mendips; but these industries, like the working of spathose iron ore among the Brendon hills, are on the wane. The chief manufactures are those of woollen and worsted goods, made in a large number of towns; silk made at Frome, Taunton and Shepton Mallet; gloves at Yeovil, Stoke, Martock and Taunton; lace at Chard; linen and sailcloth at Crewkerne; horsehair goods at Bruton, Castle Cary and Crewkerne; crape at Dulverton and Shepton Mallet. Tobacco, snuff and spirits are also manufactured; and there are large potteries at Bridgwater, where the celebrated bath-brick is made, and at Weston-super-Mare; carriage works at Bath and Bridgwater; engineering and machine-works also at Bridgwater. On the Avon, copper and iron are smelted, while several other rivers provide power for cotton, worsted and paper mills. The bulk of the export trade passes through Bristol, which is situated mainly in Gloucestershire, though it has large docks on the Somerset side of the Avon, and others at Portishead.

Communication.—Somerset is well furnished with railways. The Great Western runs between Frome, Radstock, Bath and Bristol, and from Bristol it curves south-west through Weston and Bridgwater to Taunton, dividing there and passing on into Devon. Branches leave the main line for Portishead, Clevedon and Minehead on the north, and for Witham Friary via Wells, Yeovil via Langport, and Chard via Ilminster on the south. The South-Western main line from London passes through the south-west of Somerset, running from Templecombe to Axminster in Devon, and the Somerset and Dorset runs from Bath to Shepton Mallet via Radstock. The Kennet and Avon Canal flows from Bradford in Wiltshire to Bath, and there joins the Avon, meeting on its way the two branches of the Somersetshire Coal Canal which flow from Paulton and Radstock. The Taunton and Bridgwater Canal flows into the River Parrett.

Population and Administration.—The area of the ancient county is 1,043,409 acres, with a population in 1891 of 484,337, and in 1901 of 508,256. The area of the administrative county is 1,037,484 acres. The county contains 40 hundreds and two liberties. The municipal boroughs are—Bath, a city and county borough (pop. 49,839), Bridgwater (15,209), Chard (4437), Glastonbury (4016), Taunton (21,087), Wells, a city (4849), Yeovil (9861). The urban districts are—Burnham (2897), Clevedon (5900), Crewkerne (4226), Frome (11,057), Highbridge (2233), Ilminster (2287), Midsomer Norton (5809), Minehead (2511), Portishead (2544), Radstock (3355), Shepton Mallet (5238), Street (4018), Watchet (1880), Wellington (7283), Weston-super-Mare (19,845), Wiveliscombe (1417). Among other towns may be mentioned Bruton (1788), Castle Cary (1902), Cheddar (1975), Keynsham (3512) and Wincanton (1892). The county is in the western circuit, and assizes are held at Taunton and Wells. It has one court of quarter sessions, and is divided into 22 petty sessional divisions. The boroughs of Bath and Bridgwater have separate courts of quarter sessions and commissions of the peace, and those of Taunton, Wells and Yeovil have separate commissions of the peace. The total number of civil parishes is 485. Somerset is in the diocese of Bath and Wells, excepting small parts in the dioceses of Bristol and Salisbury; it contains 508 ecclesiastical parishes or districts, wholly or in part. There are seven parliamentary divisions—Northern, Wells, Frome, Eastern, Southern, Bridgwater and Western or Wellington, each returning one member; while the parliamentary borough of Bath returns two members, and that of Taunton one member; and the county includes the greater part of the southern division of the parliamentary borough of Bristol.

History.—In the 6th century Somerset was the debatable borderland between the Welsh and Saxons, the latter of whom pushed their way slowly westward, fighting battles yearly and raising fortifications at important points to secure their conquered lands. Their frontier was gradually advanced from the Axe to the Parrett, and from the Parrett to the Tamar, Taunton being a border fort at one stage and Exeter at another. By 658 Somerset had been conquered by the West Saxons as far as the Parrett, and there followed a struggle between the kingdoms of Wessex and Mercia, decided by a great victory of Ine in 710, which led to the organization of the lands east of the Parrett as part of the kingdom of Wessex. There were still occasional inroads by the Welsh, Taunton Castle being captured in 721, but from the 8th century the West Saxon kings were rulers of what is now known as Somersetshire. About this time the bishopric of Wells was founded, and the monastery of Glastonbury restored by Ine. The next hundred and fifty years were the period of Danish invasions. Egbert, king of Wessex, became Bretwalda or overlord of all England in 827, and under him Wessex with the other frontier kingdoms was organized for defence against the Danes, and later the assessment of danegeld led to the subdivision of Wessex for financial and military purposes, which crystallized into the divisions of hundreds and tithings, probably with the system of assessment by hidation. King Alfred's victory in 878, followed by the Peace of Wedmore, ended the incursions of the Danes for a time, but a hundred years later they were again a great danger, and made frequent raids on the west coast of Somerset. At some time before the Conquest, at a date usually given as 1016, though evidence points to a much earlier and more gradual establishment, England was divided into shires, one of which was Somerset, and tradition gives the name of the first earl as Hun, who was followed by Earnulf and Sweyn, son of Godwin. There has been curiously little variation in the territory included in the county, from the date of the Gheld Inquest in 1084 to the second half of the 19th century, when certain minor alterations were made in the county boundary. These have been practically the only changes in the county boundary for 900 years, if we except the exclusion of Bristol from the county jurisdiction in 1373.

At the Conquest Somerset was divided into about 700 fiefs held almost entirely by the Normans. The king's lands in Somerset were of great extent and importance, and consisted in addition to the ancient demesne of the Crown of the lands of Godwin and Earl Harold and the estates of Queen Edith who died in 1074. The bishop of Winchester owned a vast property of which Taunton was the centre, and about one-tenth of the county was included in the estates of the bishop of Coutances, which were akin to a lay barony and did not descend as a whole at the bishop's death. The churches of Glastonbury, Athelney and Muchelney still owned vast lands, but Norman spoliation had deprived them of much that they had held before the Conquest. Among the great lay tenants who divided the conquered lands were the count of Mortain (the Conqueror's half-brother), Roger de Corcelles, Walter de Douai, Roger Arundel and William de Mohun. About this time or a little later many Norman castles were built, some of which have survived. The castles at Richmont (near West Harptree), Nunney, Farleigh, Bridgwater, Stoke Courcy, Taunton and Dunster were probably the most important. Somerset was very rich in boroughs at the time of Domesday, which points to a considerable development of trade before the Conquest; Bath, Taunton, Ilchester, Frome, Milborne Port, Bruton, Langport and Axbridge were all boroughs in 1087, and there was the nucleus of a borough at Yeovil. Somerton, Ilchester and Taunton were successively the meeting-places of the shire court. There were joint sheriffs for Somerset and Dorset until 1566 when a separate sheriff for each county was appointed. In the 7th century Somerset, as part of the kingdom of Wessex, was included in the diocese of Winchester. The new bishopric of Sherborne, founded in 704, contained Somerset until 910 when the see was divided into the dioceses of Salisbury, Exeter and Wells, the latter including the whole county of Somerset. The diocese was divided into three archdeaconries, Bath with two deaneries, Wells with seven and Taunton with four. Disputes between the chapters of Bath and Wells as to the election of the bishop led to a compromise in 1245, the election being by the chapters jointly, and the see being known as the bishopric of Bath and Wells. There has always been a strongly marked division of the county into East and West Somerset, a relic of the struggles between the Welsh and Saxons, which was recognized for parliamentary purposes by the act of 1832. Somerset contained 37 hundreds in 1087, and now contains 41. There have been considerable modifications of these hundredal divisions by aggregation or subdivision, but since the 15th century there has been little change. The meeting-place of the hundred courts was at the village or town which gave its name to the hundred in the cases of Bruton, Cannington, Carhampton, Chew, Chewton, Crewkerne, Frome, Glaston Twelve Hides, Huntspill, Kilmersdon, Kingsbury East, Milverton, North Curry, North Petherton, Norton Ferris, Pitney, Portbury, Somerton, South Petherton, Taunton, Tintinhull, Wellow, Wells Forum and Winterstoke. The hundred of Abdick and Bulstone met at Ilford Bridges in Stocklinch Magdalen, Andersfield hundred court was held at the hamlet of Andersfield in the parish of Goathurst, Bath Forum hundred met at Wedcombe, Bempstone at a huge stone in the parish of Allerton, Brent and Wrington at South Brent, Catsash at an ash tree on the road between Castle Cary and Yeovil, Hartcliffe and Bedminster at a lofty cliff between the parishes of Barrow Gurnes and Winford, Horethorne or Horethorne Down near Milborne Port, Whitstone at a hill of the same name near Shepton Mallet, Williton and Freemanors in the village of Williton in the parish of St Decumans, and Whitley at Whitley Wood in Walton parish. In the case of Kingsbury the meeting-place of the hundred is not known. The great liberties of the county were Cranmore, Wells and Leigh, which belonged to the abbey of Glastonbury; Easton and Amrill and Hampton and Claverton, which were the liberties of the abbey of Bath; Hinton and Norton, which belonged to the Carthusian priory of Hinton; Witham Priory, a liberty of the house of that name; and Williton Freemanor, which belonged for a time to the Knights Templars.

The chief families of the county in the middle ages were those of De Mohun, Malet, Revel, De Courcy, Montacute, Beauchamp and Beaufort, which bore the titles of earls or dukes of Somerset from 1396 to 1472. Edward Seymour was made duke of Somerset in 1547, and in 1660 the title was restored to the Seymour family, by whom it is still held. The marquess of Bath is the representative of the Thynne family, which has long been settled in the county, and the predecessors of the earl of Lovelace have owned land in Somerset for three centuries. Hinton St George has been the seat of the Poulet family since the 16th century. The De Mohun family were succeeded in the 14th century by the Luttrells, who own great estates round Dunster Castle. The families of Hood, Wyndham, Acland, Strachey, Brokeley, Portman, Hobhouse and Trevelyan have been settled in Somerset since the 16th century.

Somerset was too distant and isolated to take much share in the early baronial rebellions or the Wars of the Roses, and was really without political history until the end of the middle ages. The attempt of Perkin Warbeck in 1497 received some support in the county, and in 1547 and 1549 there were rebellions against enclosures. Somerset took a considerable part in the Civil War, and with the exception of Taunton, was royalist, all the strongholds being garrisoned and held for the king. Waller was defeated at Landsdown near Bath in 1643, and Goring at the battle of Allermoor in 1645. This defeat was followed by the capture of the castles held by the royalists. Bridgwater and Bath fell in July 1645, Sherborne Castle was taken in August, and after the capture of Nunney, Farleigh and Bristol in September 1645 the whole county was subdued, and very heavy fines were inflicted upon the royalists, who included nearly all the great landowners of the county. Somerset was the theatre of Monmouth's rebellion, and he was proclaimed king at Taunton in 1685. The battle of Sedgmoor on the 4th of July was followed in the autumn by the Bloody Assize held by Judge Jeffreys.

Somerset has always been an agricultural county. Grain was grown and exported from the 11th to the end of the 18th century. Cider-making has been carried on for centuries. Among other early industries, salmon and herring fisheries on the west coast were very profitable, and mining on the Mendips dated from the pre-Roman period. Stone quarrying at Hambdon Hill and Bath began very early in the history of the county; and the lead mines at Wellington and the slate quarries at Wiveliscombe and Treborough have been worked for more than a century. Coal has been mined at Radstock from a very remote date, but it did not become of great importance commercially until the county was opened up by canals and railways in the 19th century. Sheep-farming was largely carried on after the period of enclosures, and the woollen trade flourished in Frome, Bath, Bridgwater, Taunton and many other towns from the 14th to the 19th centuries. Glove-making was centred at Stoke and Yeovil at the end of the 18th century and became an important subsidiary occupation in many country districts. The county was represented in the parliament of 1290 and probably in the earlier parliamentary councils of Henry III. In 1295 it was represented by two knights, and twelve boroughs returned two burgesses each. There have been many fluctuations in the borough representation, but the county continued to return two members until 1832, when it was divided into Somerset East and Somerset West, each of which divisions returned two members. Two additional members were returned after 1867 for a third—the Mid-Somerset—division of the county, until by the act of 1885 the whole county was divided into seven divisions.

Antiquities.—The great possessions of the bishopric and of the abbey of Glastonbury led to a remarkable lack of castles in the mid part of the county, and also tended to overshadow all other ecclesiastical foundations. Even in the other parts of the county castles are not a prominent feature, and no monastic churches remain perfect except those of Bath and its cell, Dunster. At the dissolution of monasteries Bath was suppressed, the monastery of Glastonbury was destroyed, as were most of the smaller monasteries also. Of those which have left any remains, Woodspring, Montacute (Cluniac) and Old Cleeve (Cistercian) are the most remarkable. Athelney, founded by Alfred on the spot where he found shelter, has utterly perished. Montacute and Dunster fill a place in both ecclesiastical and military history. The castle of Robert of Mortain, the Conqueror's brother, was built on the peaked hill (*mons acutus*) of Leodgaresburh, where the holy cross of Waltham was found. The priory arose at the foot. Dunster, one of the few inhabited castles in England, stands on a hill crowned by an English mound. Besides these there are also remains at Nunney and Castle Cary. In ecclesiastical architecture the two great churches of Wells and Glastonbury supply a great study of the development of the Early English style out of the Norman. But the individual architectural interest of the county lies in its great parish churches, chiefly in the Perpendicular style, which are especially noted for their magnificent towers. They are so numerous that it is not easy to select examples, but besides those at Bath, Taunton and Glastonbury, the churches at Bridgwater, Cheddar, Crewkerne, Dunster, Ilminster, Kingsbury, Leigh-on-Mendip, Martock and Yeovil may be specially indicated. Of earlier work there is little Norman, and hardly any pre-Conquest, but there is a characteristic local style in some of the smaller buildings of the 14th century. The earlier churches were often cruciform, and sometimes with side towers. In domestic remains no district is richer, owing to the abundance of good stone. Clevedon Court is a very fine inhabited manor-house of the 14th century, and the houses, great and small, of the 15th, 16th and 17th centuries are very numerous. Indeed, the style has never quite gone out, as the gable and the mullioned window have lingered on to this day. Barrington Court in the 16th century and Montacute House in the 17th are specially fine examples. There are also some very fine barns, as at Glastonbury, Wells and Pilton.

SOMERSWORTH, a city of Strafford county, New Hampshire, U.S.A., on the Salmon Falls river, 5 m. N. of Dover, and opposite the town of Berwick, Maine, industrially a part of Somersworth. Pop. (1890) 6207; (1900) 7023 (3166 foreign-born); (1910) 6704. Somersworth is served by the Boston & Maine railroad, and is connected by electric line with Rochester and Dover. The river furnishes good water power, and the city's chief interests are in the manufacture of cotton and woollen goods, and boots and shoes. It has a public library. In the south-west part is Central Park, lying along the shore of Willand's Pond. The municipality owns and operates the waterworks. A settlement was established here in the latter part of the 17th century, when the territory was a part of Dover. In 1729 the parish of Summersworth was organized; in 1754 this parish was erected into the town of Somersworth; in 1821 the first company was formed to develop the water-power and establish cotton and woollen mills; in 1849 the southern half of the town was set-off and incorporated as Rollinsford; and in 1893 Somersworth was chartered as a city.

See W. D. Knapp, *Somersworth, an Historical Sketch* (1894).

SOMERVILE, WILLIAM (1675–1742), English poet, eldest son of a country gentleman, was born at Edstone, Worcestershire, on the 2nd of September 1675. He was educated at Winchester College and at New College, Oxford. After his father's death in 1705 he lived on his estate, devoting himself especially to field sports, which supplied the subjects of his best-known poems. His publications were *The Two Springs* (1725), a fable; *Occasional Poems...* (1727); *The Chase* (1735) *Hobbinol, or the Rural Games* (1740), a burlesque poem; and *Field Sports* (1742), a poem on hawking. Somervile died on the 19th of July 1742. His *Chase* passed through many editions. It was illustrated by Bewick (1796), by Stothard (1800), and by Hugh Thomson (1896), with a preface by R. F. Sharp.

SOMERVILLE, MARY (1780–1872), British scientific writer, was the daughter of Admiral Sir William George Fairfax, and was born on the 26th of December 1780 in the manse of Jedburgh, the house of her mother's sister, wife of Dr Thomas Somerville (1741–1830), author of *My Own Life and Times*, whose son was her second husband. She received a rather desultory education, and mastered algebra and Euclid in secret after she had left school, and without any extraneous help. In 1804 she married her cousin, Captain Samuel Greig, who died in 1806; and in 1812 she married another cousin, Dr William Somerville (1771–1860), inspector of the army medical board, who encouraged and greatly aided her in the study of the physical sciences. After her marriage she made the acquaintance of the most eminent scientific men of the time, among whom her talents had attracted attention before she had acquired general fame, Laplace paying her the compliment of stating that she was the only woman who understood his works. Having been requested by Lord Brougham to translate for the Society for the Diffusion of Useful Knowledge the *Mécanique Céleste* of Laplace, she greatly popularized its form, and its publication in 1831, under the title of *The Mechanism of the Heavens*, at once made her famous. Her other works are the *Connexion of the Physical Sciences* (1834), *Physical Geography* (1848), and *Molecular and Microscopic Science* (1869). Much of the popularity of her writings was due to their clear and crisp style and the underlying enthusiasm for her subject which pervaded them. In 1835 she received a pension of £300 from government. She died at Naples on the 28th of November 1872. In the following year there appeared her *Personal Recollections*, consisting of reminiscences written during her old age, and of great interest both for what they reveal of her own character and life and the glimpses they afford of the literary and scientific society of bygone times.

SOMERVILLE, a city of Middlesex county, Massachusetts, U.S.A., on the Mystic river, adjoining Boston (Charlestown), Cambridge, Medford and Arlington. Pop. (1890), 40,152; (1900), 61,643, of whom 17,232 were foreign-born; (1910 census), 77,236. Of the foreign-born in 1900 6400 were English-Canadians, 5542 were Irish, 1321 were English, 610 were French-Canadians, 590 were Italians, 576 were Scotch and 556 were Swedish. Somerville is served by the Boston & Maine railroad and by suburban electric railway lines. It is a residential and manufacturing suburb of Boston, of which, industrially, it forms a part; it is included in the metropolitan water, sewer and park districts, and in the Boston postal district. It comprises an irregular (land) area of 4·06 sq. m. in the Mystic Valley and along a range of hills or ridges, of which the largest are Prospect, Spring, Winter, Central and Clarendon hills. Among its public buildings and institutions are a fine public library (1872) with 80,000 volumes in 1908, the city hall, a state armoury, Somerville Hospital, the city poor house, a Roman Catholic home for the aged, and two high schools (English and classical). Among the parks are Broadway Park, Central Hill Park, Prospect Hill Park, Lincoln Park, and Nathan Tufts Park. The total value of the city's factory product in 1905 was $22,955,197, an increase of 14·4 per cent. over that of 1900; in 1890 the product value was only $7,307,522. The establishments include slaughtering and meat-packing houses, whose product is by far the most valuable in the city, bleacheries, finishing factories, glassworks, machine shops, tube works, jewelry factories, and a desk factory. There are also lumber and coal yards. Blue slate-stone used for building purposes is quarried.

Somerville, originally a part of Charlestown, was settled in 1630. Six hundred acres, the "Ten Hills Farm," were granted here in 1631 to John Winthrop, who built and launched here in that year the "Blessing of the Bay," the first ship built in Massachusetts. For more than a century it was a sparsely settled farming community, the only article of manufacture being bricks. On the 19th of April 1775 the British columns returning from Concord were harassed by the farmers here, as in the other towns along the line of march. Several of the hills of Somerville (*e.g.* Prospect and Central Hills) were fortified during the siege of Boston. On Prospect Hill on the 18th of July 1775 Israel Putnam raised the "Appeal to Heaven" flag, and here also is said to have been raised on the 1st of January 1776 one of the earliest of the Continental standards, the Union Jack and Stripes. On Powder House Hill (originally Quarry Hill), in Nathan Tufts Park, there still stands an interesting old slate-stone powder house, a circular building, 30 ft. high, with a conical cap, originally built (about 1703) for a windmill, deeded in 1747 to the Massachusetts Bay Colony, used in 1756-1822 as a powder house, and now marked by a bronze tablet erected by the Massachusetts Society of the Sons of the Revolution; on the 1st of September 1774, General Gage seized 250 half-barrels of powder stored here in anticipation of the outbreak of hostilities; in 1775 the powder house became the magazine of the American forces besieging Boston, and at that time Nathanael Greene maintained his headquarters at the Samuel Tufts House, and Charles Lee had his headquarters at the Oliver Tufts House, in Somerville. After the battle of Saratoga some of Burgoyne's officers were housed here. The opening of the Middlesex Canal through the town in 1803 and of the Boston & Lowell railroad in 1835 gave an impetus to the town's growth. In 1834 an Ursuline Convent, built in 1827 on Mt Benedict, was sacked and destroyed by an anti-Catholic mob. In 1842 Somerville was separated from Charlestown and incorporated under its present name; it was chartered as a city in 1871.

See T. H. Hurd, *History of Middlesex County* (3 vols., Philadelphia, 1890); S. A. Drake, *History of Middlesex County* (2 vols., Boston, 1880); E. A. Samuels, *Somerville Past and Present* (Boston, 1897); Miss M. A. Haley, *The Story of Somerville* (Boston, 1903).

SOMERVILLE, a borough and the county-seat of Somerset county, New Jersey, U.S.A., in the north central part of the state, on the Raritan river, about 36 m. S.W. of New York City. Pop. (1890), 3861; (1900), 4843, of whom 560 were foreign-born; (1905), 4782; (1910), 5069. It is served by the Central Railroad of New Jersey and by inter-urban electric lines. Adjoining the borough on the west is the town of Raritan (pop. in 1910, 3672). Places of interest in Somerville are the Old Parsonage of the Dutch Reformed Church, built in 1750–1751 of brick imported from Holland by the Rev. Theodorus Jacobus Frelinghuysen, the first pastor; the Wallace House, built in 1778 and occupied by General Washington as his headquarters during the following winter, when the main army was in camp at Bound Brook; and Duke's Park (partly in Raritan), the immense private estate (laid out as a park and open to the public) of James B. Duke, president of the American Tobacco Company. Somerville has a fine county court house (1909) of Alabama white marble. Among the borough's manufactures are stoves, ranges, soil pipe, brick, woollen goods and shirts. Settlements were made within the present limits of Somerville in the last quarter of the 17th century, and the village was at first called Raritan, all that part of the Raritan Valley from Bound Brook to the junction of the north and south branches of the river, and including the present Somerville and Raritan, then being popularly called "Raritans." The present name was adopted in 1801. Somerville became the county-seat in 1783, after the destruction of the court-house in what is now the borough of Millstone (in Hillsborough township, about 6 m. south of Somerville) on the 27th of October 1779 by British troops under Colonel John Graves Simcoe; it was incorporated as a town in 1863, and as a borough in 1909.

SOMME, a department of northern France, formed in 1790 of a large part of the province of Picardy (comprising Vermandois, Santerre, Amiénois, Ponthieu, Vimeu, and Marquenterre) and a small portion of Artois. Pop. (1906), 532,567. Area 2423 sq. m. It is bounded on the N. by Pas-de-Calais, E. by Aisne, S. by Oise, and S.W. by Seine-Inférieure, and its sea-coast extends 28 m. along the English Channel. Two streams flowing into the Channel—the Authie on the north and the Bresle on the south-west—bound it in these directions. The surface consists of great rolling plains, generally well cultivated and very fertile. The highest point, about 700 ft. above the sea, lies in the south-west, not far from Aumale. From the mouth of the Authie to the Bay of the Somme the coast is lined with a belt of sand dunes about 2 m. broad, behind which is the Marquenterre, a tract of 50,000 acres reclaimed from the sea by means of dykes and traversed by drainage canals. The Bay of the Somme, obstructed by dangerous sandbanks, contains the three fishing ports of Crotoy, St Valery, which is also the chief commercial port, and Le Hourdel. Next come the shingle banks, behind which the low fields of Cayeux (25,000 acres) have been reclaimed; and then at the hamlet of Ault commence the chalk cliffs, which continue onwards into Normandy.

The river Somme rises to the N.N.E. of St Quentin in the department of Aisne, where it has a course of about 25 m.; it traverses the department of Somme from the south-east to the north-west for a distance of about 125 m., through a marshy valley abounding in peat. Commanded by Ham, Péronne, Amiens and Abbeville, this valley forms a northern line of defence for Paris. Apart from the water-power it supplies, the Somme is of great commercial value, being accompanied by a canal all the way from its source wherever it is not itself navigable. From Abbeville to St Valery its lower course forms a maritime canal 165 ft. wide, 12 ft. deep, and 8 to 9 m. long, capable of bearing at high tide vessels of 300 tons burden. From St Valery to the open sea the current hollows out a very variable bed accessible at certain tides for vessels of 500 tons. The most important affluents of the Somme—the Ancre from the north-east by way of Albert and Corbie, the Avre from the south-east by Roye, and the Selle from the south by Conty—join the main streams at Amiens. The Authie and the Bresle are respectively 63 and 45 m. long. The latter ends in a maritime canal about 2 m. long between Eu and Tréport.

The mean temperature is lower than that of Paris (49° F. at Abbeville). The mean annual rainfall is 33 in. at Abbeville. The department, especially in the north-east, is one of the best cultivated in France. Beetroot for sugar is the staple crop of the Péronne arrondissement; cereals, chiefly wheat, fodder and mangel-wurzels, oil plants, poppy, colza, flax, hemp and potatoes are grown throughout the department, the latter more largely on the seaboard. Stock-raising of all kinds is successfully carried on. No wine is grown, the principal drinks being beer and cider. Market gardening is of great importance round Amiens. Peat-cutting is actively carried on, the best qualities and the deepest workings being in the valley of the Somme, between Amiens and Abbeville. Phosphate of lime is also an important mineral product. The manufacture of a great variety of textile goods, especially velvet (Amiens), of beet sugar and alcohol, and of locks, safes and the like (in the Vimeu), are characteristic industries of the department, which also carries on saw-milling, flour-milling, brewing, dyeing, ironfounding and forging, printing and the manufacture of paper, chemical products, machines and ironmongery, hosiery (in the Santerre), &c. Cereals, horses of the Boulogne or Norman breed, cattle, hemp and linen, and the manufactured goods are the exports of the department. St Valery (pop. 3389) exports vegetables and farm-products (to England), and shingle for the manufacture of earthenware. Besides the raw materials for the manufacturing industries, wines and timber, the latter largely imported at St Valery, dyestuffs and coal are imported.

The department is served principally by the Northern railway, and its canals and rivers provide 140 m. of navigable waterway. Administratively the department comprises 5 arrondissements (those of Amiens, the capital, Abbeville, Doullens, Montdidier and Péronne), 41 cantons and 836 communes. The department belongs to the *académie* (educational circumscription) of Lille, and constitutes the diocese of Amiens, which city is also the seat of a court of appeal and the headquarters of the region of the II. army corps, wherein the department is included.

The most noteworthy places are Amiens (the capital), Abbeville, Montdidier, Péronne, Doullens, St Riquier, Crécy and Ham, which are treated under those headings. The following places may also be mentioned: Albert (pop. 6656), after Amiens and Abbeville the most populous town in the department and a centre for machine construction; Villers-Bretonneux (pop. 4447), a centre of hosiery manufacture; Corbie, once celebrated for its Benedictine abbey (founded in the 7th century) the church of which (16th–18th century) is still to be seen; L'Étoile, with the well-preserved remains of a Roman camp; Folleville, which has a church (15th century) containing the fine Renaissance tomb of Raoul de Lannoy; Picquigny, with the remains of a château of the 14th, 15th and 16th centuries, once one of the chief strongholds of Picardy; Rue, where there is a fine chapel of the 15th century; and Tilloloy, which has a Renaissance church.

SOMMER, in architecture, a girder or main beam of a floor; if supported on two storey posts and open below, it is called a *bress* or *breast-summer*. The word is also spelled "summer," and is the same as "sumpter," a pack-horse, Fr. *sommier*, O. Fr., *saume*, from Low Lat. *salma*, pack, burden, Gr. *σάγμα*, *σάττειν*, to fasten a pack on a horse.

SOMMERFELD, a town of Germany, in the Prussian province of Brandenburg, on the Lubis, 40 m. S.E. of Frankfort-on-Oder, by the railway from Berlin to Breslau. Pop. (1905), 12,251. It has a Roman Catholic church, three Evangelical churches, several schools and a hospital. Its manufactures of woollen cloth are important; and it also contains finishing and dye-works, an ironfoundry, boiler-works and breweries.

SOMMERS, WILLIAM (d. 1560), court fool of Henry VIII., is said to have been brought to the king at Greenwich by Richard Fermor, about 1525. He was soon in high favour with Henry, whose liberality to Sommers is attested by the accounts of the royal household. The jester possessed a shrewd wit, which he exercised even on Cardinal Wolsey. He is said to have warned his master of the wasteful methods of the exchequer and to have made himself the advocate of the poor. His portrait is shown in a painting of Henry VIII. and his family at Hampton Court, and he again appears with Henry VIII. in a psalter which belonged to the king and is now in the British Museum. He was probably the William Sommers whose death is recorded in the parish of St Leonard's, Shoreditch, on the 15th of June 1560.

For his position in 16th- and 17th-century literature see T. Nash, *Pleasant Comedie called Summers' last Will and Testament* (pr. 1600); S. Rowlands, *Good Newes and Bad Newes* (1622); and a popular account, *A Pleasant Historie of the Life and Death of William Sommers* (reprinted 1794). See also John Doran, *History of Court Fools* (1858).

SOMNAMBULISM (from Lat. *somnus*, sleep, and *ambulare*, to walk), or sleep-walking, the condition under which people are known to walk along while asleep, apparently unconscious of external impressions, return to bed, and when they awake have no recollection of any of these occurrences. Sometimes the actions performed are of a complicated character and bear some relation to the daily life of the sleeper. Thus a cook has been known to rise out of bed, carry a pitcher to a well in the garden, fill it, go back to the house, fill various vessels carefully and without spilling a drop of water, then return to bed, and have no recollection of what had transpired. Again, somnambulists have been observed to write letters or reports, execute drawings, and play upon musical instruments. Frequently they have gone along dangerous paths, executing delicate movements with precision.

Four types of somnambulists may be noticed: (1) those who speak without acting, a common variety often observed in children and not usually considered somnambulistic; (2) those who act without speaking, also well known and the most common type; (3) those who both act and speak, more exceptional; and (4) those who both act and speak and who have not merely the sense of touch active but also the senses of sight and hearing. The fourth class is the most extreme type and merges into the physiological condition of mesmerism or hypnotism (*q.v.*), and it is necessary here only to notice it in connexion with the subject of sleep. Many observations indicate that, at all events in some cases, the somnambulist engaged, for example, in writing, has a mental picture of the page before him and of the words he has written. He does not see what he really writes. This has been proved by causing persons to write on a sheet of paper lying on the top of other sheets. After he had been allowed to write a few sentences, the sheet was carefully withdrawn and he continued his writing on the next sheet, beginning on the new sheet at the corresponding point where he left off on the first one. Moreover, the somnambulist, by force of habit, stroked t's and dotted i's at the exact places where the t's and i's would have been had he written continuously on one sheet, showing that what he was conscious of was not what was before him, but the mental picture of what he had done.

The following table, modified from two such tables given by Benjamin Ball (b. 1833) and Chambard in their classical article "Somnambulisme" in the *Dictionnaire encyclopédique des sciences médicales*, shows the relation of the various intermediate conditions of sleeping and awaking and of the dreaming and somnambulistic states. The horizontal stroke indicates the presence of the condition the name of which heads the column:—

	Organic life.	Consciousness.	Imaginative faculties.	Co-ordinating faculties.	Power of movement and sensibility.

Ordinary somnambulism —(2) above	—		—	—	—
Profound somnambulism (perfect unconsciousness)	—				—
Somnambulistic dream (movements in a dream)	—		—		—

The somnambulist acts his dream. His condition is that of a vivid dream in which the cerebrum is so active as to influence centres usually concerned in voluntary movements. Under the dominant idea he executes the movements that this idea would naturally excite in the waking state. Many of his movements are in a sense purposive; his eyes may be shut so that the movements are executed in the dark, or the eyes may be open so that there is a picture on the retina that may awaken no consciousness, and yet may, by reflex mechanisms, be the starting-point of definite and deliberate movements. In many cases he does not hear, the auditory centres not responding; but in others suggestive words may alter the current of his dream and lead him to perform other actions than what he intended to do. On awaking there is either no memory of what has taken place or the dim recollection of a fading dream.

It is important to notice that there is scarcely any action of which a somnambulist may not be capable, and immoral acts from which the individual would shrink in waking hours may be performed with indifference. Considering the abrogation of self-control peculiar to the physiological condition, it is evident that no moral responsibility can be attached to such actions. In cases where somnambulistic propensities place a person in danger, an endeavour should be made to induce him to return to bed without awaking him; as a rude awakening may produce a serious shock to the nervous system. Inquiry should then be made into the exciting cause of the somnambulistic dream, such as a particular train of thought, over-excitement, the reading of special books, the recollection of an accident or of a crisis in the person's history, with the view of removing the cause if possible. It should never be forgotten that somnambulism, like chorea, hysteria and epilepsy, is the expression of a general morbid predisposition, an indication of a nervous diathesis, requiring careful treatment so as to avoid more dangerous maladies.

SOMNATH, an ancient decayed city of Kathiawar in the province of Bombay, India. Pop. (1901), 8341. It is situated on a bay of the Arabian Sea. The port, which is called Verāwal, is distinct from the city proper (Deva-Pattan, Somnāth-Pattan, or Prabhas). The latter occupies a prominence on the south side of the bay, is surrounded by massive fortifications, and retains in its ruins and numerous tombs many traces of its former greatness as a commercial port. But the city was most famous for the temple just outside its walls in which stood the great idol or rather columnar emblem of Siva called Somnāth (Moon's lord), which was destroyed by Mahmūd of Ghazni. The famous "Gates of Somnath," which were supposed to have been carried off by Mahmūd to Ghazni, had probably no connexion with Somnath. They are built of deodar (11 ft. in height and 9½ in width) and are richly carved in geometric

Saracenic patterns. The gates were attached to the building covering Mahmūd's tomb at Ghazni until their removal to India, under Lord Ellenborough's orders, on the evacuation of Afghanistan in 1842. They are now contained in the arsenal at Agra.

SOMNUS, the Latin name for the personification of sleep, in Greek Hypnos (Ὕπνος). He is the son of Night and the twin brother of Death, with whom he dwells in the darkness of the underworld. At first the difference between the two is strongly marked. While Death is cruel and merciless, and never lets go his prey once seized, Sleep is gentle and kindly, the bestower of rest and pleasant dreams, the soother of care and sorrow. Even Zeus is unable to resist his influence, and on two occasions was put to sleep by him at the instance of Hera. In time, however, the conception of Death was greatly modified, until at last he was depicted as a beautiful boy, with or without wings. In like manner, Sleep came to be used as a euphemism for Death. In art the representations of Sleep are numerous and varied. On the chest of Cypselus, Night was depicted holding in her hands two sleeping children—one white (Sleep), the other black (Death). His most common form is that of a vigorous young man, with wings on his forehead; his attributes a stalk of poppy, and a horn from which he drops slumber upon those whom he puts to rest. In Ovid (*Metam.* xi. 592) the home of Sleep is placed in a dark grotto in the land of the Cimmerians, where he dwells surrounded by a band of Dreams.

See Homer, *Iliad* xiv. 231—xvi. 672; Hesiod, *Theog.* 212, 758; Pausanias, v. 18, 1.

SONATA (From Ital. *sonare*, to sound), in music, originally merely a piece "played" as opposed to "cantata," a piece sung, though the term is said to have been applied once or twice to a vocal composition. By the time of Corelli two polyphonic types of sonata were established, the *sonata da chiesa* and the *sonata da camera.*

The *sonata da chiesa*, generally for one or more violins and bass, consisted normally of a slow introduction, a loosely fugued allegro, a cantabile slow movement[1] and a lively finale in some such "binary" form (see SONATA FORMS) as suggests affinity with the dance-tunes of the SUITE (*q.v.*). This scheme, however, is not very clearly defined, until the works of Bach and Handel, when it becomes the sonata *par excellence* and persists as a tradition of Italian violin music even into the early 19th century in the works of Boccherini.

The *sonata da camera* consisted almost entirely of idealized dance-tunes. By the time of Bach and Handel it had, on the one hand, become entirely separate from the sonata, and was known as the *suite*, *partita*, *ordre* or (when it had a prelude in the form of a French opera-overture) the *overture.* On the other hand, the features of *sonata da chiesa* and *sonata da camera* became freely intermixed. But Bach, who does not use those titles, yet keeps the two types so distinct that they can be recognized by style and form. Thus, in his six solo violin sonatas, Nos. 1, 3 and 5 are *sonate de chiesa*, and Nos. 2, 4 and 6 are called partitas, but are admissible among the sonatas as being *sonate da camera.*

The sonatas of Domenico Scarlatti (*q.v.*) are a special type determined chiefly by those kinds of keyboard technique that are equally opposed, on the one hand, to contrapuntal style, and, on the other hand, to the supporting of melodies on a lifeless accompaniment. Longo's complete collection of Scarlatti's sonatas shows that, short of the true developed sonata-style, there is nothing between the old *sonata da chiesa* and Beethovenish experiments in unorthodox "complementary keys" that Scarlatti does not carry off with a delightfully irresponsible "impressionism" that enables him to be modern in effect without any serious modern principle. Great, however, as the variety of his forms is now known to be, and numerous as are the newly published slow movements, the normal Scarlatti sonata is that which the concert-player popularizes; fireworks in binary form, with a perfunctory opening, a crowd of pregnant ideas in the complementary key, and, after the double bar, a second part reproducing these ideas as soon as possible in the tonic. The sonatas of Paradies are mild and elongated works of this type with a graceful and melodious little second movement added. The manuscript on which Longo bases his edition of Scarlatti frequently shows a similar juxtaposition of movements, though without definite indication of their connexion. The style is still traceable in the sonatas of the later classics, whenever a first movement is in a uniform rush of rapid motion, as in Mozart's violin sonata in F (Köchel's Catalogue, No. 377), and in several of Clementi's best works.

[1] A *movement* is a piece of music forming a complete design, or at least not merely introductory; and within such limits as either to contain no radical change of pace or else to treat changes of pace in a simple and symmetrical alternation of episodes. The first complete movement of a sonata seldom leads without break to the others, except in modern examples; but the later movements are often connected.

The sonata in its main classical significance is a work for one or two instruments consisting of a group of movements, four movements being the full scheme; the last movement in the same key as the first; each movement normally in one tempo, complete in design, independent from the other movements in themes, but aptly related to them in key and style; and constructed in the SONATA FORMS (*q.v.*).

Though, since the time of Bach (when trios were called sonatas), the term is not applied to works for more than two instruments, the full (and even the normal) characteristics of this most important of all instrumental art-forms are rarely revealed except in trios, quartets, &c., and symphonies.

SONATA FORMS, in music. The sonata forms (see SONATA above) cover the whole ground of instrumental music from C. P. E. Bach to the advent of the instrumental lyric as matured by Schumann and of the symphonic poem originated by Liszt. They also have a profound influence on classical opera and vocal music, and hence, by repulsion, upon Wagner, whose life-work consisted in emancipating the music-drama from them. The conditions which developed them were the conditions which made Gluck's reform of opera possible; for they are at once the means and the expression of that 18th-century change in the language of music which made it a truly dramatic medium. Hence our present task is the discussion of the largest and most central problems pure music has ever dealt with; and, while the external technicalities are numerous and prominent, they are significant only so long as we maintain their connexion with those problems with which the true masters (and only the true masters) of the sonata forms are concerned. Much, then, that is essential to the true sonata forms must come under the headings of instrumentation, harmony, and other musical categories. But here we must confine ourselves to the purely formal aspect, allowing only such allusion to other aspects as will help us to see behind superficial appearances.

1. *The Sonata Style.*—The sonata forms are representative of the type of music that attracts us primarily by its design and its larger contrasts, and only in the second place by the vitality of its texture. In Bach's art the reverse is the case; we listen chiefly to the texture, and our delight in the larger designs, though essential, is seldom more than subconscious. Art-forms existed already in Bach's time, in which the shape, and not the texture, was the object of attention, but these were lighter forms. Bach himself was the greatest master of them, but he never transcended what was then their legitimate limit as an art which is related to his larger work much as decorative designs are related to architecture. Bach's suites and partitas (see SUITE) contain (apart from their great preludes, in which other principles are involved) one form embodied in several different dance rhythms, which is the germ from which the sonata was developed. It is sometimes known as the "binary" form; but as some eminent writers classify its later development as "ternary," we shall here avoid both terms, and refer to it in its earlier manifestations as the "suite" form, and in its later as the "sonata" form. In the suite it may be represented by the following diagram:—

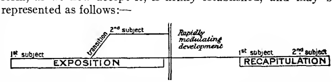
where the long horizontal line represents the main key, the short horizontal lines represent a second key, the perpendicular line represents the division into two portions,[1] and the letters represent the phrases. This form is often typified in the compass of a single melody without change of key or marked division, as in that beautiful English tune "Barbara Allen," where the half-close on the dominant in the fourth bar is symmetrically reproduced as the full close on the tonic at the end (see MELODY, example 1). On a larger scale it admits of great variety and elaboration, but the style of the classical suite never allows it to become much more than the musical analogue of a pattern on a plate. The passage from the material in the main key to that in the foreign key (from A to B in the above diagram) is continuous and unnoticeable, nor is the second part of the design which leads to the return of B in the tonic noticeably different in style or movement from the earlier part. It has a slightly greater range of key, for the sake of variety, but no striking contrast. Lastly, the rhythms, and such texture as is necessary to keep the details alive, are uniform throughout.

Now, the essential advance shown by the true sonata forms involves a direct denial of all these features of the suite style. No doubt one natural consequence of working on a larger scale is that the sonata composer tends to use several contrasting themes where the suite composer used only one; and an equally natural consequence is that the shape itself is almost invariably amplified by the introduction of a recapitulation of A as well as of B in the tonic, so that our diagram would become modified into the following:—

But these facts do not constitute a vital difference between sonata and suite forms. They do not, for instance, enable composers like Boccherini and the later Italian violin writers to emancipate themselves from the influence of the suite forms, though the designs may be enlarged beyond the bursting point. The real difference lies, indeed, in every category of the art, but primarily in a variety of rhythm that carries with it an entirely new sense of motion, and enables music to become not only, as hitherto, architectural in grandeur and decorative in detail, but dramatic in range. The gigue of Bach's C major suite for violoncello, and the allemande of his D major clavier partita, will show that the suite forms were amply capable of digesting a non-polyphonic style and a group of several contrasted themes; but they still show the uniformity of rhythm and texture which confines them to the older world in which visible symmetry of form is admissible only on a small scale. Haydn can write a movement, perhaps shorter than some of Bach's larger dance movements, containing only one theme and mainly polyphonic in texture, as in the finale of his tiny string quartet in D minor, *Op.* 42; but the transformations of his one theme will be contrasted in structure, the changes of rhythm will be a continual surprise, the passage from the first key to the second will be important and emphatic, and at every point the difference in scope between his sonata music and Bach's suite music will be as radical as that between drama and lyric. The process of this change was gradual; indeed, no artistic revolution of such importance can ever have been accomplished more smoothly and rapidly. Yet Philipp Emmanuel Bach, the first to realize the essentials of the new style, obtained his object only at the cost of older elements that are essential to artistic completeness. And Haydn himself was hardly able to reinfuse such vitality of texture as would give the new form permanent value, before he was forty years of age.

Haydn's earlier string quartets, from *Op.* 1 to *Op.* 33, present one of the most fascinating spectacles of historical development in all music. He was content to begin at a lower level of brilliance than some of his contemporaries; because from the outset his object was the true possibilities of the new style, and no luxuriance of colour could blind him to the lifelessness of an art that is merely suite-form spun out. Haydn's earliest quick movements in sonata forms are often as short as any suite movement, except when he writes for orchestra, where he is influenced by the style of the operatic overture as we find it in Gluck and in the symphonies of Philipp Emmanuel Bach In his slow movements he at first more often than not worked in the style and form of the operatic aria; and in so mature a piece as the quartet in G major, *Op.* 17, No. 5, he not only endorses Philipp Emmanuel Bach's evident conviction that operatic recitative is within the scope of the sonata, but convinces us that he is right. It was easy for the early composers of sonatas to introduce theatrical features into their instrumental music; for the very fact that the sonata forms were in polyphonic days the forms of lighter music is a consequence of their original identity with the forms of stage-music and dance (see OVERTURE and SYMPHONY). But it needed a very great composer to realize not only the radically dramatic character of a sonata form in which the rhythm and texture is emancipated from the metrical bondage of the suite, but also its true limitations as pure instrumental music. As Haydn's work proceeded, so did the freedom of his rhythm and its consequent inner dramatic life increase; while the external operatic influences soon disappeared, not so much because they were out of place, as because opera itself "paled its ineffectual fires" in the daylight of the pure instrumental drama with its incomparably swifter and terser action. Polyphony, on the other hand, steadily increased, and was so openly encouraged that in the first set of Haydn's quartets which is entirely free from archaism (*Op.* 20) three of the finales are regular fugues. And from that time onward there is hardly a work of Haydn's in which highly organised *fugato* passages are not a frequent means of contrast.

2. *The Sonata Form.*—In the last-mentioned quartets of Haydn and the works of Mozart's boyhood, the normal sonata form, as we now accept it, is firmly established, and may be represented as follows:—



This diagram is, no doubt, equally true of Philipp Emmanuel Bach's form; and thus we see how little the external shape of a movement tells us as to the ripeness or genuineness of the specimen. Apart from this, much confusion of thought is caused by the unfortunate terms "first and second subject," which have misled not only many teachers but nearly all pseudo-classical composers into regarding the exposition of the movement as consisting essentially of two themes expanded to the requisite size by appropriate discourse. When we use the terms "first and second subject," then, let us be understood to mean any number of different themes, in any variety of proportion, but separable into two groups of which the first is in the tonic while the second is in another related key, which is called the complementary key. The exposition of a movement in sonata form contains, then, these two "subjects" and represents these two keys; and unless the work is too large or too emotional for merely decorative emphasis, the exposition is generally repeated. Then the development follows. It is normally founded on the materials of the exposition, but neither confines itself steadily to any key nor leaves its material as it found it. On the contrary, its function is to provide a wide range of modulation, and to put the materials into fresh light by regrouping them (see MELODY, examples 2–7). It cannot be too strongly insisted that in the sonata forms there are no rules whatever for the number of themes and their relative prominence among themselves and in their development. After the development the first subject returns in the tonic, with an effect which, after so many changes of key, is always reassuring as regards

[1] In all stages of development it has been usual to repeat at least the first portion. The repetition is indicated by a sign and may be ignored in analysis, though Haydn, Beethoven and Brahms have sometimes produced special effects by it. The repetition of the second part is now obsolete, and that of the first nearly so.

design, and sometimes intensely dramatic. The second subject follows, also in the tonic. This recapitulation is normally very exact, except for the alteration necessary to bring the second subject into the tonic instead of the complementary key, an alteration which, of course, will chiefly affect the first subject, if, indeed, the original transition was not so simple that it could be merely suppressed. In highly organized works, however, this point is often marked by some special stroke of genius, and even in the most exact recapitulations the great masters make minute changes which throw the second subject into higher relief. Modern criticism tends to dismiss the recapitulation as a conventional and obsolescent feature; but this is a great mistake. The classics, from Scarlatti to Brahms, give overwhelming proof that it is a primary instinct of composers with a living sense of form to conceive of all kinds of exposition as predestined to gain force by recapitulation, especially in any part that resembles a second subject. Haydn we shall find to be an extreme case; but we have only to regard his true second subject as residing in the very end of his exposition, and his mature work will then illustrate the point with special force. Beethoven seems to give one notorious detail to the contrary effect, in the first movement of his C minor symphony, but the passage only proves the rule more forcibly when seen in its context. The powerful phrase that announced the second subject is in the recapitulation transferred from the resounding triumph of the horns to the impotent croaking fury of the bassoons. This looks like a mere inconvenient result of the fact that in 1808 the horns could not transfer the phrase from E flat to C without a change of crook. But in earlier works Beethoven has made them change crooks on far less provocation; and besides, he could easily have contrived a dozen tone-colours more dignified than that of the bassoons. The point must, then, be one of Beethoven's touches of Shakespearian grotesqueness; and certainly it draws attention to the recapitulation. But even if we dismiss it with impatience we are then immediately confronted with a new melodic and harmonic poignancy in the subsequent *crescendo*, produced by changes as unobtrusive and as essential to the life of the whole as are the deviations from mechanical symmetry in the forms of leaves and flowers. With the recapitulation the bare essentials of sonata form end; but the material will probably, in works on a large scale, furnish ample means of adding a more emphatic conclusion, which is then called the coda. In Beethoven's hands the coda ranges from a dramatic non-existence, as in the distant thunder in which the first movement of the D minor sonata expires, to the mighty series of new developments and climaxes which, in the 3rd and 9th symphonies and many other works, tower superbly above the normal structure.

Haydn's later treatment of sonata form is very free. He shows a sense of space and breadth which, if second to Beethoven's, can only be said to be so because the terms of Haydn's art did not give it fuller expression. The scale on which he worked was so small that he soon found that a regular recapitulation took up all the room he wanted for larger growths to a brilliant climax. Moreover, he found that if his second subject began with material in sharp contrast to the first, it tended to make his movements sound too undeveloped and sectional for his taste; and so in his later works he generally makes his second subject on the same material as his first, until the very end of the exposition, where an exquisitely neat new theme forms the close. This cadence-theme also rounds off the whole movement with an appearance of regularity which has led to the belief that Haydn, like Mozart, observes a custom of rigid recapitulation from which Beethoven was the first to emancipate the form. The truth is that the brilliant new developments which oust the recapitulation almost entirely in Haydn's form are more like Beethoven's codas than anything else in earlier music, and the final appearance of the neat cadence-theme at the end is, from its very formality, the most brilliant stroke of all. Lastly, these tendencies are characteristic, not of Haydn's early, but of his late work. They have been described as "showing form in the making"; but this is far from true. They show form in an advanced state of development; and further progress was only possible by the introduction of new qualities which at first had a decidedly restraining effect.

Mozart's greater regularity is due, not to a more formalizing tendency than Haydn's, but to the fact that he works on a larger scale and with a higher polyphony. In actual length, Mozart's movements are so much greater than Haydn's that sharply contrasted themes and regular recapitulations do not hamper him. On the contrary, they give his designs the necessary breadth. This was not more his aim than Haydn's; but he had the opportunities of a later generation and the example of Haydn's own earlier work, besides a vast experience of composition (both in contrapuntal and sonata forms) that began in his miraculous infancy and made all technical difficulties vanish before he was fifteen. At sixteen he was writing string-quartets in which his blending of polyphonic and sonata style is more surprising, though less subtle, than Haydn's. At twenty-two he was treating form with an expansiveness which sometimes left his music perilously thin, though he was never merely redundant. The emphatic reiterations in the *Paris* symphony are not mannerisms or formulas; they are the naturally simple expression of a naturally simple material. In a series of easy-going works of this kind he soon learnt the conditions of breadth on a large scale; and, by the time he came under the direct influence of Haydn, every new polyphonic, rhythmic and instrumental resource enlarged the scale of his designs as fast as it increased their terseness and depth. His career was cut short, and his treatment of form reached its limit only in the direction of emotional expression. The sonata style never lost with him its dramatic character, but, while it was capable of pathos, excitement, and even vehemence, it could not concern itself with catastrophes or tragic climaxes. The G minor symphony shows poignant feeling, but its pathos is not that of a tragedy; it is there from first to last as a result, not a foreboding nor an embodiment, of sad experiences. In the still more profound and pathetic G minor quintet we see Mozart for once transcending his limits. The slow movement rises to a height not surpassed by Beethoven himself until his second period; an adequate finale is unattainable with Mozart's resources, and he knows it. He writes an introduction, beautiful, mysterious, but magnificently reserved, and so reconciles us as he best can to the enjoyment of a lighthearted finale which has only here and there a note of warmth to suggest to us any pretension of compatability with what went before.

Beethoven discovered all the new resources needed to make the sonata a means of tragic expression, and with this a means of expressing a higher rapture than had ever been conceived in music since Palestrina. He did not, as has sometimes been said, emancipate sonata forms from the stiffness of the recapitulation. On the contrary, where he alters that section it is almost invariably in order to have, not less recapitulation, but more, by stating some part of the second subject in a new key before bringing it into the tonic. Here, as has been suggested above, the effect of his devices is, both in minutiae and in surprises, to throw the second subject into higher relief. Every one of the changes which appear in the outward form of his work is a development from within; and, as far as any one principle is more fundamental than others, that development is primarily harmonic. We have elsewhere mentioned his practice of organizing remote or apparently capricious modulations on a steady sequential progression of the bass, thereby causing such harmonies to appear not as mere surprises or special effects (a form in which they have a highly artistic function in Mozart and Haydn) but as inevitable developments (see BEETHOVEN and HARMONY). The result of this and a host of similar principles is an incalculable intensification of harmonic and emotional expression. Let us compare the opening of the second subject of Haydn's quartet in A major, *Op.* 20, No. 6, with the corresponding passage in the first movement of Beethoven's sonata, *Op.* 2, No. 2. Haydn executes the masterly innovation of a second subject that before establishing its true key passes through a series of rich modulations. He begins in E minor, rapidly passing through G and A minor, and so to the dominant of E, in various phases of tender humour and cheerful climax. The keys are remote but not unrelated, the modulations are smooth, and the style is that of a witty improvization. Beethoven's second subject is intensely agitated; its modulation begins like Haydn's as regards key, but its harmonies are startling and its pace tremendous. Its regular rising bass carries it in two steps to a totally unrelated key, through which it is urged by the same relentless process with increasing speed, and when it is at last driven to the threshold of the key which it seeks as its home there is a moment of suspense before it plunges joyfully into its cadence. Such resources as this enable Beethoven to give rational dramatic force to every point in his scheme, and so they soon oust those almost symbolical formulas of transition and cadence which are a natural feature in Mozart's music and a lifeless convention in imitations of it. The growth of Beethoven's forms is externally most evident in his new freedom of choice for the complementary key. Hitherto the only possible key for the second subject was in major movements the dominant, and in minor movements the relative major or dominant minor. A sonata which begins by treating all directly related keys as mere incidents in establishing the tonic, will very probably choose some remoter key as its main contrast; and it is worth while trying the opening of the *Waldstein* sonata (*Op.* 53) with the simple alteration of C sharp and A natural for C natural and A sharp in the bass of the twenty-first bar, so as to bring the whole transition to the second subject on to the orthodox dominant of G, in order to see, on the one hand, how utterly inadequate that key is as a contrast to the opening, and, on the other hand, how unnecessarily long the transition seems when that is the key which it is intended to establish.

3. *The Sonata as a whole.*—The history of the *Waldstein* sonata marks the irrevocable transition from Mozart to Beethoven (see iv. 88); and in his rejection of the well-known *Andante in F* (which was originally intended for its slow movement) Beethoven draws attention to the problem of the sonata as a whole, and the grouping of its movements. The normal sonata, in its complete (or symphonic) form, consists of four movements: firstly, a quick movement in that sonata form *par excellence* to which our discussion has been hitherto confined; then two middle movements, interchangeable in position, the one a slow movement in some lighter form, and the other a dance movement (the minuet, or scherzo) which in earlier examples is of hardly wider range than a suite movement. The finale is a quick movement, which may be in sonata form, but generally tends to become influenced by the lighter and more sectional rondo form, if indeed it is not a set of variations, or even, in the opposite extreme, a fugue. Aesthetically, if not historically, this general scheme is related to that of the suite, in so far as it places the most elaborate and highly organized movement first, corresponding to the allemande and courante; while the slow movement, with its more lyric character and melodious expression, corresponds to the sarabande; the minuet or scherzo to the lighter dance tunes or " Galanterien " (such as the gavotte and bourrée), and the lively finale to the gigue. But just as the whole language of the sonata is more dramatic, so are the contrasts between its movements at once sharper and more essential to its unity. Hence, the diversity of outward forms within the limits of these four movements is incalculable.

The first movement is almost always in the sonata form *par excellence*, because that admits of higher organization and more concentrated dramatic interest than any other. Often after such a movement a slow piece in the form conveniently known as A B A, or simple " ternary " form (*i.e.* a broad melody in one key, followed by a contrasted melody in another, and concluded by a recapitulation of the first) is found to be a welcome relief, and of great breadth of effect. Of course in all true classics the very simplicity of such movements will be inspired by that sense of rhythmic freedom and possibility of development that permanently raises sonata forms from the level of a mere decorative design; nor, on the other hand, is there any limit to the complexity of form possible to a slow movement, except that imposed by the inevitable length of every step in its slow progress. Still, the tendency of slow movements, even more than of finales, is to prefer a loose and sectional organization. Sonata form is frequently used in them by Haydn and Mozart with the success attainable only by the greatest masters of rhythmic flow; but even in their works the development is apt to be episodic in character, and is very often omitted.

The minuet, in Haydn's and Mozart's hands, shows a surprising amount of rhythmic variety and freedom within the limits of a dance tune; but Haydn, as is well known, sighed for its development into something larger; and, though Beethoven had long emerged from his " first period " before he could surpass the splendid minuet in Haydn's quartet in G major, *Op.* 77, No. 1, he achieved in the scherzo of his *Eroica* symphony the first of a long line of movements which establish the scherzo (*q.v.*) as an essentially new art-form.

The only condition that affects the forms of finales is that a sonata involves a considerable stretch of time, and therefore its end must be so designed as to relieve the strain on the attention. In a drama or a story the deeper artistic necessity for this is masked by the logic of cause and effect, which automatically produces the form of an intrigue ending in a *dénouement*. In music the necessity appears in its purest form. There is no need for finales to be less serious than first movements; or even, in certain ways, less complex; but the attention which could be aroused at the outset by problems must be maintained at the end by something like a solution. Hence the use of the lighter rondo forms, which, by dividing the work into shorter and more distinct sections, make the development easier without unduly limiting its range. Hence, also, the influence of rondo style upon such finales as are cast in true sonata form; and hence, lastly, the paradox that the fugue has occasionally been found a possible means of expression for the finale of a dramatic sonata. For the complexity of the fugue, though incessant, is purely a complexity of texture, and the mind in following that texture instinctively abandons any effort to follow the form at all, finding repose in the change of its interests.

Now, just as within the typical scheme of first and second subject development and recapitulation in the first movement, there is room for genius in the contrasting of different rhythms and proportions, so, within the limits of the simple four-movement scheme of the whole sonata is there room for genius in the contrast of various types and degrees of organization. The complete four-movement scheme seldom appears in works for less than three instruments. Beethoven was the first to adopt it for solo sonatas, and he soon thought fit to make omissions. In Haydn's work for less than four instruments it was not even necessary that the " sonata " form itself should be represented at all. Its essential spirit could be realized in the melodic and rhythmic freedom of a group or couple of more sectional movements, nor did Beethoven (in *Op.* 26 and *Op.* 27, No. 1) consider such works unworthy of the name of sonata, or (in *Op.* 54) incapable of expressing some of his most original ideas. No design is known to pure instrumental music that is not possible as a movement of a sonata, if it has the characteristic freedom of rhythm and is not much over a quarter of an hour in length. There is no form that has not been so applied; and, indeed, the only instrumental form that has maintained a larger development outside than inside the scheme of the sonata is that of *variations* (*q.v.*).

As the scope and complexity of the sonata style grew, so did the interdependence of its movements become more evident. With Mozart and Haydn it is already vital, as we have seen in the crucial case of Mozart's G minor quintet; but the differences between one scheme and another are not remarkable until we study them closely; and, except in key-relationship, it would be difficult to trace anything more concrete than principles of contrast as interacting between one movement and another. But Beethoven's dramatic power finds as free expression in the contrasts between whole movements as it finds within the movements themselves. In his later works, the increase in harmonic range, with the consequent prominence of remoter key-relationships, necessitating the dwelling on these keys at greater length causes the key-system of each movement to react on the others to an extent that would be purposeless in the art of Haydn and Mozart. Thus in the B flat trio, *Op.* 97, we find such remote keys as G major, D flat and D major placed in positions of great functional importance, until we come to the finale, which keeps us in suspense by its very low and quiet key-colour, contrasting so oddly with its bacchanalian temper. But when the whole main body of this finale has passed before us in the drab colours of tonic, dominant and sub-dominant, the coda marvellously explains everything by opening with an enharmonic modulation to the most distant key yet attained except as a transitory modulation.

As Beethoven proceeded, his growing sense of the functional expression of musical forms enabled him to modify and strengthen them until their interaction was as free as its principles were exact. In the C sharp minor quartet (*Op.* 131) the opening fugue is functionally an enormously developed introduction. The following *allegro*, in the startling key of D major, the "artificial" flat supertonic, is a first movement, with its development suppressed, and with certain elements of rondo style as a necessary contrast to the preceding fugue. The startling effect produced by this key of D major necessitates a simple and limited key-system within the movement itself, thus accounting for the absence of a development. The remaining movements fall into their place among the keys that lie between the keys of D major and C sharp minor. Thus the slow movement (to which the brief *allegro moderato* forms a dramatic introduction) is a great set of variations in A major, and the strictness of its variation form allows no change of key until the two brilliant bursts of remoter harmony, F and C, in the coda. Then follows a scherzo of extremely simple design, in E major, with a small part of its trio in A. A short introduction in G sharp minor, the dominant, completes the circle of related keys and leads to the finale which (though cast in a compound of rondo and sonata form that would allow it a free range of modulation) contents itself with very simple changes, until towards the end, where it systematically demonstrates the exact relationship of that first surprising key of D major to C sharp minor.

4. *The Unity of the Sonata.*—The gigantic emotional range of Beethoven's work is beyond the scope of technical discussion, except in so far as the technical devices themselves suggest their emotional possibilities. The struggle between decadence and reaction since the time of Beethoven indicates on the one side the desire to rival or surpass Beethoven in emotional expression without developing the necessary artistic resources; and, on the other side, a tendency to regard form as a scheme which the artist first sets up and then fills out with material. Early in the 19th century these tendencies gave rise to controversies which are not yet settled; and before we discuss what has taken place since Beethoven we must consider the connexion between sonata movements in a last new light.

Historical views of art are apt to be too exclusively progressive and to regard higher and lower degrees of organization in an art-form as differing like truth and falsehood. But in trying to prove that the megatherium could not survive under present conditions, we must beware of arguing that it never existed; nor must we cite the fact that man is a higher organism in order to argue that a jelly-fish is neither organic nor alive. Organization in art, as elsewhere, may be alive and healthy in its lowest forms. The uniformity of key in the suite forms is low organization; but it is not inorganic until a mild seeker after novelty, like A. G. Muffat, tries to introduce more keys than it will hold. The interdependence of movements in Haydn and Mozart is not such high organization as the ideal form of the future, in which there is no more breaking up of large instrumental works into separate movements at all; but neither is it a mere survival from the decorative contrasts of the suite. Evolutionists must not forget that in art, as in nature, the survival of the fit means the adaptability to environment. And the immortal works of art bring their proper environment with them into later ages.

The large instrumental forms have, until recent times, remained grouped into sonata movements, because their expression is so concentrated and their motion so swift that they cannot, within the limits of a single design, give the mind time to dwell on the larger contrasts they themselves imply. Thus, in the "Sonata Appassionata," the contrast between the first subject and the main theme of the second is magnificent; but that calm second theme lasts just the third part of a minute before it breaks off. Now, though the third part of a minute bears about the same proportion to the whole design as five hundred lines does to the design of *Paradise Lost*; though, moreover, this theme recurs three times later on, once in an exact recapitulation, and twice transformed in terribly tragic climaxes; yet the mind refuses to be whirled in less than ten minutes through a musical tragedy of such Shakespearian power without opportunity for repose in a larger scheme of contrasts than any attainable by the perfection and breadth of the single design within these limits. Hence the need for the following slow set of variations on an intensely quiet tune, which, by its rigorous confinement to the tonic of a nearly related key, its perfect squareness of rhythm, and the absolute simplicity and strictness of its variations, reveals the true pathos of the first movement by contrast with its own awful repose; until its last chord, the first in a new key, falls like a stroke of fate, and carries us headlong into the torrent of a finale in which nothing dares oppose itself to those sublime forces that make the terror of tragedy more beautiful than any mere appeal for sympathy. Thus the dramatic interdependence of sonata movements is very strict. Yet the treatment by each movement of its own thematic material is so complete that there is little or no scope for one movement to make use of the themes of another. Such instances as may be suspected in Beethoven's later works (for example, the similarity of opening themes in various movements of the sonatas, *Op.* 106 [1] and *Op.* 110) are too subtle to be felt more than subconsciously; while the device of clearly quoting an earlier movement occurs only in three intensely dramatic situations (the introductions to the finales in *Op.* 101, the violoncello sonata, *Op.* 102, No. 1, and the 9th symphony) where its whole point is that of a surprise.

5. *The Sonata since Beethoven.*—It is unlikely that really vital sonata work will ever be based on a kind of Wagnerian *Leitmotif* system, until the whole character of instrumental form shall have attained the state of things in which the movements are not separated at all. There has been no ambitious or "progressive" composer since Beethoven who has not, almost as a matter of etiquette, introduced the ghosts of his earlier movements into his finale, and defended the procedure as the legitimate consequence of Beethoven's *Op.* 101. But, while there is no a priori reason for condemning such devices, they illustrate no principle, new or old. The nearest approach to some such principle is furnished once by Schumann, who always ingeniously adapts the outward forms of the sonata to his own peculiar style of epigrammatic and antithetic expression, discarding as beyond his scope the finer aspects of freedom and continuity of rhythm, and constructing works which bear much the same relation to the classical sonata as an elaborate mosaic bears to an easel-picture. Dealing thus with a looser and more artificial type of organization, Schumann was able in his D minor symphony to construct a large work in which the movements are thematically connected to an extent which in more highly organized works would appear like poverty of invention, but which here furnishes a rich source of interest. Many other experiments have been tried since Beethoven, by composers whose easy mastery is that of the artist who, from long practice in putting material into a ready-made form, becomes interested in the construction of new ready-made forms into which he can continue to put the same material. A sense of beauty is not a thing to be despised, even in pseudo-classical art; and neither the many beautiful, if mannered, works of Spohr, which disguise one stereotyped form in a bewildering variety of instrumental

[1] In *Op.* 106 the first two notes of the slow movement were an afterthought added (as Beethoven told his publisher) for the purpose of producing such a connexion.

and literary externals, nor the far more important and essentially varied works of Mendelssohn deserve the contempt which has been the modern correction for their high position in their day. But we must not forget that the subject of sonata forms is no mere province, but covers the whole of classical instrumental music; and we must here pay attention only to the broadest essentials of its central classics, mentioning what diverges from them only in order to illustrate them. Schubert's tendencies are highly interesting, but it would carry us too far to attempt to add to what is said of them in the articles on MUSIC and SCHUBERT.

The last great master of the sonata style is Brahms. A larger scale and more dramatic scope than Beethoven's seems unattainable within the limits of any music identifiable with the classical forms; and the new developments of Brahms lie too deep for more than a bare suggestion of their scope here. Much of the light that can as yet be shed upon them will come through the study of Counterpoint and Contrapuntal Forms (*q.v.*). Outwardly we may see a further evolution of the coherence of the key-system of works as wholes; and we may especially notice how Brahms's modern use of key-relationships makes him carry on the development of a first movement rather in a single remote key (or group of keys) than in an incessant flow of modulations which, unless worked out on an enormous scale (as in the 2nd and 4th symphonies), will no longer present vivid enough colours to contrast with those of the exposition. Beethoven's last works already show this tendency to confine the development to one region of key. Another point, fairly easy of analysis, is Brahms's unlimited new resources in the transformation of themes. Illustrations of this, as of older principles of thematic development, may be found in musical type in the article MELODY (examples 8–10). But no mere formal analysis or argument will go further to explain the greatness of Brahms than to explain that of Beethoven, Haydn or Mozart. Yet by that outward sign of dramatic mastery in the true sonata style, that variety of rhythmic motion which we have taken as our criterion, Brahms has not only shown in every work his kinship with Haydn, Mozart and Beethoven, but in one particular work he has given us documentary evidence of his faith in it. In his last years he revised, or rather recomposed, his first piece of chamber music, the trio in B major, *Op.* 8. The new material differs from the old, not only as a fresh creative impulse, but also in the simple fact that it moves literally four times as fast. Such rapidity is not shown by any external display of energy; indeed there is incomparably more repose in the new version than in the old. But the comparison of the two clearly demonstrates that the true sonata style is, now, as at the outset, primarily a matter of swift action and rhythmic variety; and nothing more certainly indicates the difference between the true style and the lifelessness of decadence or academicism than this sense of motion and proportion.

In so far as the tendencies of modern instrumental music represent an artistic ideal which is foreign to that of the sonata without being false, they represent a different type of motion, wider in its sweep, and consequently slower in its steps. The forms such a motion will produce may owe much to the sonata when they are realized, but they will certainly be beyond recognition different. In all probability they constitute the almost unconscious aims of the writers of *symphonic poems* (*q.v.*) from Liszt onwards, just as the classical sonata constituted the half-conscious aim of more than one quaint writer of 18th-century programme-music. But the growing importance and maturity of the symphonic poem does not exclude the continued development of the sonata forms, nor has it so far realized sufficient consistency and independence of style to take as high a place in a sound artistic consciousness. The wider sweep of what we may conveniently call "ultra-symphonic" rhythm owes its origin to Wagner's life-work, which consisted in evolving it as the only musical medium by which opera could be emancipated from the necessity of keeping step with instrumental music. Small wonder, then, that the new art of our time is as yet, like that of Haydn's youth, stage-struck; and that all our popular criteria suffer from the same obsession. One thing is certain, that there is more artistic value and vitality in a symphonic poem which, whatever its defects of taste, moves at the new pace and embodies, however imperfectly, such forms as that pace is fit for, than in any number of works in which the sonata form appears as a clumsy mould for ideas that belong to a different mode of thought. If from the beginnings exemplified by the symphonic poems of the present day a new art-form arises in pure instrumental music that shall stand to the classical sonata as the classical sonata stands to the suite, then we may expect a new epoch no less glorious than that which seems to have closed with Brahms. Until this aim is realized the sonata forms will represent the highest and purest ideal of an art-form that music, if not all art, has ever realized.

SONCINO, a town of Lombardy, Italy, in the province of Cremona, 11 m. E. of Crema by steam tramway, 282 ft. above sea-level. Pop. (1901), 6150 (town); 8136 (commune). It contains a handsome castle built in 1469–1475 for Galeazzo Maria Sforza by Benedetto Terrini (cf. L. Beltrami, *Il Castello di Soncino*, Milan, 1890). The town was the seat of a Hebrew printing-press founded in 1472, but suppressed in 1597, when the Jews were expelled from the duchy of Milan.

SONDERBURG, a seaport and seaside resort of Germany, in the Prussian province of Schleswig-Holstein, on the S.W. coast of the island of Alsen, of which it is the chief town, and 17 m. by steamboat N.E. from Flensburg. Pop. (1905), 7047. It is connected with the mainland by a pontoon bridge, and has a castle, now used as barracks, in the beautiful chapel of which many members of the Sonderburg-Augustenburg line lie buried; a Lutheran church and a town hall. There is an excellent harbour, and a considerable shipping trade is done. The town, which existed in the middle of the 13th century, was burnt down in 1864 during the assault by the Prussians upon the Düppler trenches.

SONDERSHAUSEN, a town of Germany, capital of the principality of Schwarzburg-Sondershausen, situated in a plain 37 m. by rail N. of Erfurt. Pop. (1905), 7383. It possesses a castle, with natural history and antiquarian collections, and a parish church (restored 1891), with the mausoleum (1892) of the reigning princes. There are manufactures of woollens and pins.

SONDRIO, a town of Lombardy, Italy, capital of the province of Sondrio, in the Valtellina, 1140 ft. above sea-level, on the river Adda, 26 m. E. of Lake Como and 82 m. by rail N.E. of Milan. Pop. (1901), 4425 (town); 7707 (commune). The Valtellina, of which Sondrio is the capital, produces a considerable quantity of red wine. Sondrio also has silk-works. Above the town to the north rise the snowclad peaks of the Bernina group. The railway goes on to Tirano, 16 m. farther east, from which diverge the Bernina and Stelvio roads.

SONE, or SON, a river of central India which has been identified with the Erannoboas of the Greek geographers. With the exception of the Jumna it is the chief tributary of the Ganges on its right bank. It rises in the Amarkantak highlands about 3500 ft. above sea-level, the Nerbudda and Mahanadi also having their sources in the same table-land. From this point it flows north-west through an intricate mass of hills, until it strikes the Kaimur range, which constitutes the southern wall of the Gangetic plain. Here it turns east and continues in that direction until it falls into the Ganges about 10 m. above Patna, after a total course of 465 m. Its upper waters drain about 300 m. of wild hilly country, which has been imperfectly explored; while in its lower section of 160 m. it traverses the British districts of Mirzapur, Shahabad, Gaya and Patna. The Sone canals, fed by the river, form a great system of irrigation in the province of Behar. The headworks are situated at Dehri about 25 m. below the point where the river leaves the hilly ground. The weir across the Sone at this point is believed to be the longest constructed in a single unbroken piece of masonry, the length between abutments being 12,469 ft. A main canal is taken off on either bank of the river, and each of these is divided into branches, according to the requirements of the ground. The system consists of some 370 m. of canals and 1200 m. of distributaries, irrigating 555,000 acres. The Sone canals were begun in 1869, and came into operation in 1874; they form a valuable protection to the rice crop of Behar.

SONG, either an actual "singing" performance, or in a literary sense a short metrical composition adapted for singing or actually set to music. In the second sense of the word it must strictly be lyrical in its nature; but musicians and others frequently use the word in the wider sense of any short poem set to music. A "song," as a form of poem, usually turns on some single thought or emotion, expressed subjectively in a number of stanzas or strophes. Almost every nation is in possession of an immense store of old simple ballads (*q.v.*), which are the spontaneous outcome of the inspiration of the people ("folk-songs"), and represent in a remarkable degree their tastes, feelings and aspirations; but in addition to these, there are, of course, the more finished and regular compositions born of the conscious art of the civilized poet.

In a purely literary sense the song may exist, and does largely exist, without any necessary accompaniment of music. With the accession of Elizabeth the attention of the English poets was immediately drawn to the importance of this branch of lyrical literature. The miscellanies, one of which Master Slender would have paid more than forty shillings to have in his pocket on a celebrated occasion, were garlands of songs, most of them a little rude in form, only mere "packets of bald rhymes." But about 1590 the popularity of the song having greatly increased, more skilful writers were attracted to its use, and the famous *England's Helicon* of 1600 marked the hey-day of Elizabethan song-writing. In this Shakespeare, Sidney, Lodge, Barnfield and Greene, to name no others, were laid under contribution. Lyly, with such exquisite numbers as "Cupid and my Campaspe" (1584), had preceded the best anthologies, and is really the earliest of the artist-songsters of England. Among superb song-writers who followed were Marlowe ("Come live with me and be my love"), Campion ("My sweetest Lesbia") Ben Jonson ("Drink to me only with thine eyes") and Fletcher ("Here ye Ladies, that depise"), most of these being dramatists, who illuminated their plays, and added a delicate ornament to them, by means of those exquisite lyrical interpolations. Side by side with such poets, and a little later, began to flourish the school of cavalier song-writers, for whose purpose the lyric was self-sufficient. They added to our literature jewels of perennial lustre—Wither, with his "Shall I wasting in despair," Herrick with "Bid me to live" and "Gather ye Rosebuds," Carew with "Ask me no more where June bestows," Waller with "Go, lovely Rose," Suckling with "Why so pale and wan, fond Lover?" and Lovelace with "Tell me not, Sweet, I am unkind." This was the classic age of the true British song, which survived all other forms of poetry after the decay of taste, and continued to flourish in the hands of Dryden, Sedley, Aphra Behn and Rochester down to the last decade of the 18th century. That outburst of song was followed by nearly a hundred years during which the simplest and more direct forms of lyrical utterance found comparatively little encouragement. Just before the romantic revival the song reasserted its position in literature, and achieved the most splendid successes in the hands of Burns, who adapted to his purpose all kinds of fragmentary material which had survived up to his time in the memories of rustic persons. In Scotland, indeed, the song was rather revived and adorned than resuscitated; in England it may be said to have been recreated by Blake. At the opening of the 19th century it became the vehicle of some of the loveliest fancies and the purest art of Coleridge, Keats, Shelley, Byron and Landor; while in a later day songs of rare perfection were composed by Tennyson and by Christina Rossetti. (E.G.)

Song in Music.

The history of song as a musical form falls into two main divisions, the one belonging to the folk-song, the other to the art-song. Though the line of demarcation between the two cannot be definitely drawn, for they have acted and reacted upon each other ever since music existed as a cultivated art, yet it may reasonably be maintained that the folk-song, which lies at the base of all music, preserves, and has in all ages preserved, characteristics such as must always distinguish the rude and unconscious products of the human mind, working more by instinct than by method, from the polished and conscious products of the schools. For the purposes then of this article, *art-song* may be distinguished from folk-song by the fact that it is the work of trained musicians and is designed, at any rate after the close of the 16th century, for voice with instrumental accompaniment, whereas we shall restrict the term *folk-song* to such melodies as appear to have been the work of untutored minds, and to have arisen independently of any felt necessity for harmonic support.

The early history of song on its musical side may be regarded as the history of the evolution of melody: and since what is known of melody before the end of the 16th century, apart from the folk-song, is extremely slight, it is in the folk-song itself that this evolution is primarily to be studied. Previously to the period named the instrumental accompaniment to vocal melody, both in the folk-song and in the art-song, played an entirely insignificant part. Afterwards the new conception of harmony which came in with the 17th century not only shifted the basis of melody itself but made the instrumental accompaniment an essential feature of artistic song. Though it lies beyond the province of this article to discuss fully the complex questions involved in the evolution of vocal melody, some slight sketch is a necessary preliminary to a proper understanding of the subject under consideration.

Origins.

It may be assumed that in the course of ages the uncouth vocal utterances of primitive man developed, under the influence of an instinct for expressing his inner nature through a more expressive medium than language alone, into sounds of more or less definite pitch, bearing intelligible relationships one to another; and that from these emerged short phrases, in which rhythm probably played the principal part, reiterated with that interminable persistency, which many travellers have noted as characteristic of savage nations in the present day. A further stage is reached when some such primitive phrase is repeated at a different level by way of contrast and variety, but melody in any true sense of the word does not begin till two different phrases come to be combined in some sort of scheme or pattern. When the power to produce such combinations become common in a nation, its musical history may be said to have begun.[1] Racial characteristics are displayed in the choice of notes out of which such phrases are formed. But in all races it may be surmised that the main determining cause in the first instance is that natural rise and fall of the voice which gives expressiveness and meaning to speech, even though contributory causes arising from the imitative faculty common to man may perhaps be admitted—such as the sound of the wind, the waves of the sea, the cries of animals, the notes of birds, the striking of one object against another, and finally the sounds made by primitive instruments. The tendency of the speaking voice to fall a fourth and to rise a fifth has often been noted. It is probable that these intervals were among the first to be defined, and that the many modes or scales, underlying the popular melodies of the various nations of the world, were the result of different methods

[1] If the one phrase is represented by *A*, and the other by *B*, the commonest melodic schemes presented by the folk-songs of the world may be viewed thus—*AB*, *AAB*, *ABB*, *ABA*, *ABAB*, *AABB*, *AABA*, *ABBA*. Of these, those in which the opening phrase *A* is repeated at the conclusion are the most satisfactory, for both instinct and reason are gratified by a connexion between the beginning and the end.

As exact conformity to pattern becomes wearisome and is alien to the progressive instinct, the element of surprise is introduced into the above schemes by various modifications of the repeated phrase on its second appearance, or by the entrance of an entirely new phrase *C*. In some fine melodies there is no repetition of phrase, a number of different phrases being knit, by principles, which defy analysis, into one structure. Such melodies imply a melodic sense of an exceptional order. Many melodies involve more than four phrases; of these the rondo form should be mentioned—*ABACADA* of determining the intervening sounds. It has been generally assumed that the fall of a fourth is the interval earliest arrived at by the instinct of the Indo-European race—and that intervening sounds were added which resulted eventually in the three possible forms of the diatonic tetrachord, the earliest being that which is characteristic of the ancient Dorian mode or scale (the basis of the Greek musical system) in which two tetrachords, having the semitone between the lowest note and the next above it, are superimposed (see Bourgault Ducoudray, Introduction to *30 Chansons de Grèce et d'Orient*).

It must, however, be remembered that the popular instinct knows nothing about tetrachords or scales, which are abstractions, and only creates melodies, or at least successions of sounds, which are the outward expression of inward feelings. The Greek theorists therefore, in recording certain modes as being in use in their day, were in effect merely stating results arrived at by analysing popular melodies—and from the persistence with which the Greeks, and following them, most of the musical historians of Europe, have insisted upon a tetrachordal basis for the art of music it may be assumed that in these melodies a basis of four diatonic notes was a conspicuous feature.

It is a feature which marks a considerable number of folk-songs heard in Greece at the present day, and also of many folk-songs which are not Greek, the Breton, for example (see Bourgault Ducoudray, *Chansons de Basse-Bretagne*). The interval of a fourth is nearly always prominent too in the music of savages. If it is natural to connect these facts with the drop of a fourth, characteristic of the speaking voice, it is dangerous to assume an exclusively " tetrachordal period " of primitive song, at any rate till it can be shown that melodies based on other principles did not exist side by side with those that are tetrachordal. From the rise of a fifth and the fall of a fourth, the octave, which results from combining these intervals, may well have become familiar at a very early epoch. Indeed a prolonged howl beginning on a high note and descending a full octave in semitones—or notes approximately resembling semitones—is recorded both of the Caribs and of the natives of Australia, so that familiarity with the octave need not presuppose an advanced stage of musical development.

To pass from the sphere of mere speculation nearer to the domain of history, it may be asserted with confidence that the oldest form of song or chant which can be established is found in certain recitation formulae. These, as is natural, will be found to be derived from the rise and fall of the voice in speech. It is therefore not surprising that O. Fleischer (*Sammelbände der internationalen Musik-Gesellschaft*, Jan.–Mar. 1902) is able to trace practically identical formulae in the traditional methods of reciting the Vedas, the Koran, the Jewish and Christian liturgies. The simplest form consists of four notes (a diatonic tetrachord), a reciting note, preceded by two notes rising to it, and followed by a fall, or cadence, for the close, the voice rising above the reciting note in order to emphasize important words, or according to the nature of the sentence. An extended form is both natural and common.

The influence of these and similar formulae [1] upon popular melodies can be illustrated by countless examples (for which the reader is referred to *I.M.G.*). As characteristic as any is the melody of the Christian hymn which begins

and concludes

Another is the Hungarian folk-song: *Nem Szoktam.*

Many French songs have been collected in recent years, of which the following formula, or variations of it, form an essential feature:—

This corresponds closely with the third example given above. That the melodies in question are of great antiquity may be inferred from the fact that they are almost confined to the oldest class of folk-song, that which celebrates May Day and the beginning of spring. M. Tiersot (*La Chanson populaire en France*, Paris, 1889) plausibly finds in them a survival of a melodic fragment, which may have belonged to pagan hymns in honour of spring, basing his supposition upon the fact that the phrase in question occurs in the melody of the Easter hymn " O Filii et Filiae." The medieval Church, acting on principles familiar in all ages, may well have helped to merge a pagan in a Christian festival by adopting, not merely old rites and observances, but the actual melody with which these had for ages been associated. A similar survival in French folk-song is that of the melody of the *Tonus peregrinus*, the chant used for the psalm " When Israel came out of Egypt " (mentioned in the 9th century by Aurelian Réomé as being very old). Its appearance, like that of the Easter hymn, in songs, which on other grounds can be proved to be of great antiquity, points to the probability of its being of popular origin. It also bears equally strong marks of being derived from a recitation formula, as indeed its appropriation for chanting a psalm sufficiently indicates.

Endeavours to detach other primitive formulae from the popular melodies in which they are enshrined form a branch of folk-lore now being actively pursued. It may be hoped that " comparative melodology " —if the phrase may be coined—will do for this department of musical knowledge what the science of comparative philology has done for language. Oscar Fleischer (*I.M.G.* i. 1) has endeavoured to trace the history in Europe of the primitive phrases belonging to the melody of " Les Séries " (or *Unus est Deus*) as given by De Villemarqué in *Barzaz-Breiz*

[1] The derivation of such formulae from more primitive incantations of magicians and medicine-men is a possible and plausible theory (see J. Combarieu, *La Musique: ses lois et son évolution*. Paris, 1907).

No. 1, in the musical appendix, as also of the opening phrase in the old Christian hymn, " Conditor alme siderum " (attributed to Bishop Ambrose):—

The phrase here belongs to a melody in the Phrygian mode, but when it is used in major melodies its characteristic notes are those of the common chord, with a rise to the sixth at the point of climax, corresponding to the rise in the recitation formulae given above.

By what processes the notes of the common chord became universally established it is not possible to determine, but it may be said in a general way that the reference to a given tonic was felt in all ages to be a necessary condition even of the simplest melody, and that, as the melodic instinct grew, an almost equal necessity was found for a point of contrast, and that this point of contrast became with most nations of Aryan origin the fifth note above the tonic, at any rate in the more popular scales. Combarieu (*La Musique*, p. 121) observes that we owe the use of the octave, the fifth and the fourth to the South and East, but that the importance of the third in our modern musical system is due to the instinctive genius of the West and North, *i.e.* to England and Scandinavia (see also Hugo Riemann, *Geschichte der Musiktheorie*, Leipzig, 1898, and Wooldridge, *Oxford History of Music*, i. 161–162, where the well-known quotation from Giraldus Cambriensis, or Gerald Barry, of the 12th century, establishing the fact of part-singing in England, is given). If, as has been shown, the origin of many melodies can be traced to formulae originally used for chanting or reciting, it must not be forgotten that formulae thus derived assume very different characters under the influence of more decided rhythms than that of speech. To accompany bodily movements (which by a natural law become rhythmical when often repeated) with music, vocal or instrumental, is an almost universal human instinct, whether to alleviate the burden or the monotony of labour, as in rowing, sowing, spinning, hammering and a score of other pursuits, or to promote pleasure and excitement, as in the dance.

It is unsafe to infer, as some have done, from the custom, known in all ages, of dancing and singing at the same time, that song arose as a mere accessory to the dance. It is more probable that the dance has its origin in the mimetic actions, which are the natural accompaniment of rudimentary song. At the same time, no one will deny that races with ballads of their own early made use of them for the dance, and that, especially on the rhythmical side, melody owes to the dance an incalculable debt.[1]

It may be assumed then that upon some such basis as has been roughly indicated the different nations of the world have developed each their own musical phraseology, emanating from and answering to their several needs and temperaments and that the short melodic phrases, out of which folk-tunes are made, have their roots in a past as distant as that in which the elements of language were formed, and that the popular instinct which through countless ages has diversified those forms and arranged them into melodies, whose constructions are mostly susceptible to analysis, is the same instinct as that which has given to language its grammar and its syntax.

History of Song in Europe.

In proceeding now to the actual history of song in Europe, it must be remembered that it is inseparably connected with poetry. Melody till within comparatively recent times continued to fulfil its original function of enhancing the value and expressiveness of language. For poetry of the epic kind with the long lines common to early European peoples, some such forms of chanting as have been indicated must have sufficed.

[1] For the growth of the refrain from communal dancing and singing, see C. J. Sharp, *English Folk-Songs*, p. 93. Nor should the association of dancing with all primitive religious ceremonies be forgotten—see K. J. Freeman, *Schools of Hellas* (1907).

Melody, as we understand it, with compact form and balanced phrases, could only have existed if and when the same qualities appeared in popular poetry. This was probably the case long before the taste for long epic narratives began to disappear in favour of more concise forms of ballad and of lyric. The stanza form must have been generally familiar in the early middle ages from the Latin hymns of the Church, and these hymns themselves are likely to have been formed, in part at any rate, on models which were already known and popular.

Popular Song.

We have definite information that in the early middle ages two sorts of popular poetry existed—the historical ballads (descendants of those alluded to by Tacitus in his *Germania* as characteristic of the Germans, and as constituting their only historical records), and popular songs of a character which caused them to be described as *cantica nefaria* by St Augustine; the council of Agde (506) forbade Christians to frequent assemblies where they were sung: St Césaire, bishop of Arles, speaks of the *chants diaboliques* sung by country folk, both men and women; the Council of Châlons menaced the women, who seem to have been the chief offenders, with excommunication and whipping; lastly Charlemagne, whose love for the better class of song is attested by the fact that he ordered a collection of them to be made for his own use, said of the other "canticum turpe et luxuriosum circa ecclesias agere omnino, quod et ubique vitandum est." Beyond the fact of their existence we know nothing of these songs of the early middle ages. Their influence on the popular mind was vigorously resisted, as we have seen, by the Church, and for many centuries efforts were made to supplant them by songs, the subjects of which were taken from the Gospel narratives and the lives of the saints, so that folk-song and church song strove together for popularity. Doubtless the church song borrowed musical elements from its rival: nor was the folk-song uninfluenced in its turn by the traditional music of the Church. In considering this latter music, it is important to distinguish between the melodies adapted to the prose portions of the ritual without definite rhythm, and those of the hymns, where the metre of the Latin verses and their stanza form necessitated a corresponding rhythm and musical form. Rhythm in music, which has its origin and counterpart in the regular bodily movements involved in various departments of labour and in the dance, must, as has already been said, have always been an essential feature of popular melody, and it is reasonable to conclude from its absence in the plain-song, and indeed for many centuries in the compositions of musicians, which had the plain-song for their basis, that these hymns, which represented the popular part of the Church services, were also representative of the popular tastes of the time. In all ages the Church has drawn largely from popular song for the melodies of its hymns. It is moreover in the highest degree improbable that the Church should have been able to evolve out of its inner consciousness, without pre-existing models, a melody—to take a single instance—like that of " Conditor alme siderum "—the survival of which in innumerable European folk-songs has already been alluded to.

Numerous additions to the store of plain-song melodies were made by the monastic composers of the middle ages: the most notable is that of the *Dies Irae*, of which the words are attributed to Thomas de Celano (d. 1250).

Reference should also be made to the music of the liturgical dramas or mysteries, popular in medieval times: *The Lamentation of Rachel*, *The Wise and Foolish Virgins* and *The Prophets of Christ*, are given, both text and music, in Coussemaker's *L'Harmonie au moyen âge*. They reflect the severe style of the plain-song, and were probably intended for cultivated rather than popular audiences. The same is probably true of the secular songs quoted in the same work. These have a special interest as being the earliest specimens of song which have come down to us in Christian times. The best known is the " Complainte," on the death of Charlemagne (quoted in many histories), the dignified, if somewhat dreary, melody of which revolves mostly on the first three notes of a major scale, once rising to the fourth (thus recalling the old recitation formula). Rhythm is practically absent. On the other hand, the song in honour of Otto III. has definite rhythm and a degree of tunefulness. The "modus Ottino" was a well-known air, which, unlike the rest of those quoted by Coussemaker, was probably of popular origin, for the Latin words do not fit the melody and probably represent a free translation from an original in the vernacular tongue.[1]

Modus Ottinc.

(12 *more stanzas.*)

More remarkable still is a "Chanson de Table" of the 10th century, a really graceful melody, the quotation of which may serve to destroy the illusion that the major scale, so often described as modern, has any other claim to the title than the fact that it has been preserved by modern musicians, while others have been discarded.

In the same collection may be found, beside other historical songs, two odes of Boethius and two odes of Horace, set to music;[2] but whether the melodies given represent medieval music or Roman music, corrupted or not, it is impossible to determine. These songs have been dwelt upon, for they not only represent some kinds of music that were sung in the 9th and 10th centuries, but indicate the sources from which later on the work of the troubadours was derived. They may be summed up as a church-song and folk-song, and the songs by more or less cultured persons made after these models. For the subsequent history of the art the folk-song represents by far the most potent influence, but the melodies quoted by Coussemaker which might be regarded as the works of the popular instinct afford insufficient data for safe generalization. More direct evidence is to be found in the 12th-century pastoral play—*Le Jeu de Robin et de Marion*, till within recent years considered as the work of Adam de la Hale, but since the able criticisms of M. Tiersot in the work referred to above, likely henceforth to be regarded as the oldest collection of folk-songs in existence; for the original compositions which Maître Adam has bequeathed to posterity preclude us from believing that he could have originated the dainty airs contained in that play, of which *Robin m'aime* is generally familiar, and is still to be heard on the lips of peasants in the north of France (see Tiersot, p. 424, n.). If M. Tiersot's view is correct, the melodies in *Robin et Marion* may be taken to represent the popular style of an epoch considerably anterior to the date of the play itself (though allowance must be made for the correcting hand of a professional musician) which is our excuse for introducing them at this place.

Before speaking of the songs of troubadours, trouvères and minnesingers, allusion must be made to a class of men who played a part the importance of which both in the social and political life of the middle ages is attested by innumerable chroniclers and poets, viz. the skalds, bards or minstrels—the chief depositories of the musical and poetical traditions of the several countries to which they belonged. They varied greatly in rank. Some were attached to the retinue of kings and nobles, whilst others catered for the ear of the peasantry (eventually to be classed with jugglers, acrobats, bearwards and the like, sharing the unenviable reputation which attached to these representatives of popular medieval amusements). That these latter were also welcome at the halls of the great, is an established fact, which may serve as a reminder that in feudal times the distinction that now exists between the music of the cultivated classes and of the peasantry was but slight. The style of the church music was as universally familiar as the style of the folk-song. For musicians, both of high and low degree, no other models existed. This fact is patently clear when the songs of the troubadours, trouvères and minnesingers are studied. Those minstrels continued the traditions of the better class of their predecessors, with strivings after a more polished, elaborate and artistic style. In forming their style upon an admixture of folk-song and church-song they in fact assimilated neither, and created a mongrel product without real vitality—a product that left practically no mark upon the subsequent development of the art. The astonishing skill which they exhibited in adapting the language of poetry to the most complicated metrical forms deserted them when they touched the question of musical form and of melody. Indeed their music, except in rare instances, was an adornment which the poetry could have dispensed with, and may be regarded in the main simply as a concession to the immemorial custom of treating music and poetry as inseparable arts.

The real importance of these courtly minstrels in the history of song consists in their having firmly established the rhyming stanza as the vehicle for the expression of lyrical feeling, for with the rhyming stanza a corresponding compact and symmetrical melodic form was bound to come. It was, however, reserved for the popular instinct, and not for trouvères and minnesingers, to develop this form (it is probable too that some at least of the stanza forms employed belonged first to popular poetry and were afterwards developed and elaborated by these musicians of the great houses). The scheme upon which the lyrical stanza was usually based was one in which two similar parts (called by the German *Meistersingers*, *Stollen* or props, and constituting the *Aufgesang* or opening song) were followed by an independent third part, the length of which was not prescribed (called *Abgesang* or concluding song). The complete stanza was called *Lied* and was knit together by different schemes of rhyme. For the first part the trouvères and *Meistersingers* were content with some simple phrase, often borrowed direct from the folk-song, repeating it, as was natural, for the exactly similar second part: then for the third the style was apt to change towards the ecclesiastical and to wander aimlessly on to an unconvincing conclusion. The popular instinct was finer, for we find in innumerable folk-songs, belonging to the 14th and 15th centuries, that the greater length of the *Abgesang* was seized upon as an opportunity, not merely for introducing fresh material, after the repetition of the phrase attached to the two *Stollen*, but also for a return to that phrase,

[1] This melody, which is plainly derived from recitation, with A as *tonus carrens*, closely resembles that of Ljómur, a folk-song of the Faeroe islanders, noted by H. Thuren in 1902 and identified by him with a piece of recitation ("Fili care") from a 12th-century "Drame liturgique" (deciphered by O. Fleischer, *Neumenstudien*, Bd. II. p. 23). See *Folkesangen paa Farøerne*, H. Thuren (Copenhagen, 1908). Identity of style between a popular song of the 9th century, a *drame liturgique* of the 12th and a folk-song still sung in the 20th is sufficiently striking—especially in view of the fact that in the Faeroe Islands instrumental music is practically unknown.

[2] Lord Ashburnham has a Virgil of the 10th century, "dans lequel les discours directs de l'Eneide sont accompagnés de notations musicales" (Coussemaker).

or some reminiscence or variation of it, by way of conclusion, thus producing a compact form, answering to the natural requirements of the artistic sense. Thus the favourite scheme of the troubadours, which may be represented as AAB, had developed in the folk-song into the scheme AABA—and this scheme has served for thousands of popular melodies throughout Europe. In some rare cases the contrasting portion might be conceived as implying modulation into the key of the dominant, thus foreshadowing the form of the first movement in modern sonatas and symphonies.[1] But the present writer is sceptical, from the evidence afforded by folk-song melodies recently collected, of an instinct for modulation among a peasantry unfamiliar with harmonic music. Be that as it may, the courtly minstrels both of France and Germany rendered a real service to music in following the popular verdict in favour of the major scale or Ionian mode, and in so doing prepared the way for modern harmony, which is based upon a particular relationship of contrast between the notes composing the chord of the tonic and those composing the chords of the dominant and the sub-dominant—a relationship inherent in no other scale of the Gregorian system but the Ionian. On it the secret of musical form in the modern sense depends, for it brings with it the power of modulation (unknown to medieval times), *i.e.* the power of treating the same note as belonging to different tone centres (G, for instance, as the dominant of the scale of C, and also as the tonic of the scale of G), and the further power, by means of the chord of the dominant seventh, of proceeding from one tone centre to another. As long then as musicians held the Ionian scale at arm's length, progress in the modern direction was impossible. They did indeed arrive eventually at the goal, partly through the practice of using popular melodies as the foundation, or *canto fermo*, of masses and motets, and of arranging the melodies themselves for choirs of voices, and also through the increasing need, as the art of part-writing became more elaborate and better understood, of modifying the strict character of the modes by the introduction of accidentals, till, as Sir Hubert Parry remarks, "after centuries of gradual and cautious progress they ultimately completed a scale which they had known all along, but had rather looked down upon as an inferior specimen of its kind." The melodic instinct, thus developing consciously in the minds of trained musicians, and unconsciously in the makers of folk-songs, arrived eventually at the same result. But the major scale once firmly established, the trained musician based upon it a new art of harmony; further, he modified existing minor scales for harmonic purposes, leaving the old traditional scales as the almost exclusive possession of the folk-song (which has cherished and preserved them in their pristine integrity up to the present day) and working out the problem of musical composition, and of melody itself, on a new foundation.[2]

The fall of the Hohenstaufen dynasty, and the troublous times that ensued in Europe, involved the removal of the patronage to which the higher kinds of minstrelsy owed their position and their influence. Song passed with the close of the age of chivalry from the noble to the burgher class. The *Minnesingers* were succeeded by the *Meistersingers*, the first gild of whom is said to have been established in 1311 by Heinrich von Meissen (popularly known as Frauenlob) at Mainz. In their hands song was treated more in the spirit of a trade than an art, and subjected to many absurd and pedantic regulations. In Wagner's famous opera is given a very accurate and faithful picture of their methods and ideals. Their importance in the history of song consists not so much in actual work achieved as in the enthusiasm widely spread through their means in the class from which most of the great German composers were eventually to spring.

The real interest for the historian of song centres during this period not in the attempts of minstrels and burgher gilds to improve upon the folk-song, but in the folk-song itself. Those who have studied the large collection of medieval melodies contained in Böhme's *Altdeutsches Liederbuch* for Germany, and in Duyse's *Het oude Nederlandshe Lied* for the Netherlands, will on other grounds than those mentioned above be ready to confirm this judgment. It is not too much to say that they contain many of the noblest melodies which the world possesses, earnest and dignified in spirit, broad of outline, and knit together in all their parts with rare and unconscious art, on principles of structure which are carefully analysed in the chapter on folk-song in Sir Hubert Parry's *The Art of Music.* To the examples there quoted may be added the wonderful *Tagelied* ("Der Dag wil nict verborghen sin"), *Ik sek adieu*, *Lieblich hab sich gesellet*, *Abschied von Innspruck* (of which both Bach and Mozart are reported to have said that they would rather have been the author than of any of their own compositions), and "Entlaubet ist der Walde" (which, like so many of the popular songs of the 14th and 15th centuries, was utilized by the Reformers for one of their finest hymns).

A characteristic feature of many of these songs, both German and Dutch, is the *melisma*, or vocal flourish, of the concluding phrase, derived, if German historians are to be trusted, from the vocalization on the last syllable of the word Alleluia, which in the early Church represented the congregational portion of its services and which afterwards developed into the sequences, so popular in the middle ages.

A similar feature is not uncommon in French melodies of the same period (see *L'Amour de moi*, *Vrai Dieu d'amour*, and *Réveillez-vous*, *Piccars*, in *Chansons du xv^e siècle*, by Gaston Paris and Gevaërt, Paris, 1875). If the charming English song "The Nightingale" (Medieval and Plainsong Society) is of popular origin, it may serve as an indication that these melismata were also common in England (cf. also "Ah! the sighs that come from my heart," which belongs to the reign of Henry VIII.).

It is in the highest degree unfortunate that no collections were made of English popular songs of the middle ages: everything points to the fact that quantities of them existed. The importance of song in the social life of every class is attested by all the chroniclers and poets. An age that produced "Sumer is a cumin in" (1240) must have been prolific of melody. It is impossible to regard it as an isolated phenomenon. The beauty of songs by early composers, and of others, which are possibly of popular origin, met with in the reigns of Henry VII., Henry VIII., Edward VI. and Elizabeth (see Wooldridge's edition of Chappell's *Popular Music of the Olden Time*) argue a great and healthy activity in the preceding centuries. It is sufficient to mention Morley's "It was a lover and his lass" and "O Mistress mine," or "The Three Ravens," which though it first appeared in print in 1611 is undoubtedly a folk-song belonging to a much earlier period (for versions still to be heard see Kidson's *Traditional Times*). The same is probably true of "A poor soul sat sighing" and many others. It is to be remarked, however, that printed versions of popular songs can seldom be relied upon as faithfully representing their original form, or even the form in which they were sung at a particular epoch. Editors have seldom resisted the temptation of tampering with popular airs, if by so doing they can render them more attractive to polite tastes. Within recent years, however, the collection and publication of folk-songs has been undertaken in a different spirit—and it is possible in most countries to study the folk-songs in versions which have been taken direct from the lips of the peasantry and are presented without editorial alterations. The question as to the propriety of such alterations, or the larger question of what is suitable in the way of

[1] For examples see Böhme, *Altdeutsches Liederbuch*, Nos. 131 and 195.

[2] Modal folk-song melodies are often tested by their conformity or otherwise to the modes as known from medieval composers. This is to limit our conception of natural forces by the use made of them by a few men at a particular epoch for special purposes. If a mode can be said to exist for a purpose, that purpose is melody: to apply to modal folk-melodies the canons laid down by composers with whom melody was a *quantité négligeable* is sheer perversity. Recent discoveries in the field of folk-song place us in a far better position for understanding the true nature of the modes than medieval composers: for in the folk-song their free development has not been hampered by restrictions, which were a necessary condition of polyphonic work.

instrumental accompaniment, need not be discussed here more than to point out that the strictly scientific point of view —which seeks to understand the folk-song in its native simplicity—should not be mixed up with that of the artist who aims at adding to the world's store of beautiful music.

It is to be deplored that the English composers of the 15th and 16th centuries did not follow the example of Dutch, German and French musicians, who utilized popular melodies as the foundation or *canto fermo* of their masses and motets (one example only is known, " O Westron Wynde ") and also arrange them in parts for music-loving circles (to a limited extent this appears to have been done in England, *e.g.* the Freemen's Songs in *Deuteromela*). But in England, as in other European countries, survivals of medieval melodies are still to be found among the peasantry in quantities which vary according to the degree in which modern music has penetrated to country districts. In Germany, for instance, where musical culture has been most widely spread, the medieval folk-song, according to Herr Böhme, is no longer heard; it is possible, however, that this statement may be contradicted or modified, if the same systematic search for the Germanic folk-song, which has been made recently in France, England and elsewhere, is undertaken before it is too late. Melodies formed by composers under the principles of modern harmonic music have largely usurped their place.[1]

The folk-song is eventually killed by the products of the musical manufactories of the town. The peasantry provided with songs from outside is relieved from the necessity of providing for its own needs, or of cherishing with the love of earlier times its own traditional inheritance. It is true that for many centuries numbers of composed songs have found their way into the popular repertory and have there undergone in many instances transformations which serve as a complete disguise to their real origin: but in general a fine ear can detect these intruders. For even when they have suffered change or transformation in passing through a new environment the stamp of an individual or a period remains, whereas the folk-song of tradition is the work not of one age, but of many, not of the individual, but the collective mind. For songs made by uncultivated persons, and passed on to others without the aid of writing or of printing, soon lose in the course of oral transmission even such traces of individual authorship as they may once have possessed. Moreover the makers of folk-songs are concerned with nothing so little as the assertion of their own individuality. They know that it is the most familiar that is the most acceptable. Novelty has no charms for themselves or their audiences. Instinct as well as policy keep them to recognized types and formulae; and the innumerable variations which these undergo from age to age are probably far more frequently due to lapses of memory than to capacity for invention. Major tunes inadvertently sung in minor modes, or vice versa, or the accidental application of a tune to verses, for which it was not originally intended, give rise in many cases to practically new melodies. Though an author might be named, if it were possible to know the history of a folk-melody, for each change that it has assumed in the course of its history, it is clear that authorship of this kind is not what we mean when we name Dibdin as the author of " Tom Bowling." The theory that the folk-song is but the degenerate offspring of a cultivated ancestry, that the peasantry have, in fact, taken their music from a superior class, and transformed it to suit their own tastes and idioms, has been and is still held apparently by many (see Closson, *Chansons populaires belges;* and Combarieu, *La Musique*, p. 114). This is tantamount to the assumption that the presence among songs of the peasantry of beautiful melodies involves pre-existing musical civilization, and that the popular instinct is incapable, without cultivation, of creating melodies that are artistically beautiful. It would be difficult to support this assumption in the case of the German and Dutch medieval songs, to which reference has been made; the cases that could be cited, in which well-known airs of the town have passed to the country and suffered transformation, are insufficient data for establishing a general rule as to the origin of folk-songs. Indeed, the very fact of such transformation tends to prove the existence of a strictly popular music, into whose idiom the town music is transformed. To deny that uncultivated peasants can create melody is to forget that the languages even of savages have their grammar and syntax, as well as qualities that are rhythmical and musical, and that even among civilized people those same qualities existed long before they were analysed and tabulated by grammarians, and further developed by trained literary men. The case of melody is strictly analogous to that of languages.

[1] The error must be guarded against of supposing that melodies, heard to-day among the peasantry, which suggest medieval times, are necessarily medieval in origin. It has been already indicated that dorian, aeolian and mixolydian modes (to name those which are most prevalent) are natural modes, not church modes; they are still employed by folk-singers in many parts of Europe. A melody in the modern major scale is just as liable at the present day to submit to transformation into the mixolydian or some other mode, as melodies in other modes are liable to become major.

As every country has its own store of folk-songs in which national characteristics find expression through idioms which differentiate its songs from those of other countries, it would be arbitrary to select the songs of one country rather than those of another for separate discussion.

The Art-Song.

The history of the art-song has now to be considered, of solo song, that is, with instrumental accompaniment as an essential part. Songs for two or more voices with or without accompaniment, though they properly belong to the subject of this article, are passed over, for they but exhibit the tendencies manifested in solo song when applied to more complicated forms. Operatic songs and arias are likewise omitted (except in the early Italian period), as belonging to a branch of music which requires separate treatment (see ARIA; OPERA). Instrumental song arose during the 16th century, a time in which composers, released by the spirit of the Renaissance from the exclusive service of the Church, were already becoming active in secular directions. The madrigal was the favourite form of composition and was rapidly approaching its period of maturity: it was now to be superseded as the popular diversion of cultivated society by solo song. The habit had already sprung up of supplying voices that might be missing in a madrigal by instruments: if all the voices but one were absent, the effect of a solo with instrumental accompaniment was realized. A still nearer approach to solo song was made when singers, selecting one part of a madrigal for the voice, themselves played the rest on lute or *chitarrone*. In such performances the voice part was likely to receive most attention —even in madrigal-singing it was not unknown for the soprano to embroider her part with *gruppetti* and ornamental passages (see Kiesewetter's *Schicksale u. Beschaffenheit des Weltlichen Gesanges*, p. 72, for an example of a simple part as embellished by the well-known Signora Vittoria Archilei)—and the accompaniment to undergo processes of simplification, thus preparing the way for melodies, simple or ornate, with unobtrusive accompaniments, and perhaps also contributing to the invention of that declamatory or recitative style, attributed to Cavalieri, Peri and Caccini, the founders of oratorio and opera. Such melodies are found in Caccini's famous *Nuove Musiche*, published in Venice in 1601 (" Feri Selvaggi " may serve as a beautiful specimen of simple melody; " Cor mio " is typical of the ornate style, " Deh! dove son fuggite " of the declamatory: the last two are quoted in Kiesewetter, *Geschichte und Beschaffenheit des Weltlichen Gesanges*, p. 73). Caccini claimed in the preface to that work to be the first to invent songs " for a single voice to the accompaniment of a simple instrument." It is true that his friends in Rome (his native city), at whose houses these new compositions were performed, assured him that they had never heard the like before, and that his style exhibited possibilities for the expression of feeling, that were excluded, when the voice sang merely one part in a contrapuntal work. But, about thirty years before Caccini, lutenists in France had anticipated his innovations, and composed solo songs, with lute accompaniments, in which is evidenced the struggle, not always successful, to break away from polyphonic traditions. Le Roy's *Airs de Cour*, published in 1571, may be cited in proof of this statement. Of these airs "Je suis amour" is somewhat in the declamatory recitative style of Caccini's *Nuove musiche* (see Sammelbände, *Int. Musik Gesellschaft*, article "Airs de Cour of Adrien le Roy," by Janet Dodge). Generally speaking, it may be said of early French songs that they were longer in shaking off the influence of the past than the songs of the Italians, many tricks of expressions, belonging to polyphonic times, surviving both in voice parts and accompaniments. In the voice parts sometimes the influence of popular song is evident, at others they are neither melodious nor yet declamatory, but merely suggest a single part in a polyphonic composition, while the accompaniments for the lute are generally a mixture of chords used with harmonic effects, and certain polyphonic tricks inherited from the past two centuries. In England two books of "Ayres," for a single voice with lute accompaniment, one by Jones, and another by Campion and Rosseter, were published in 1601; Jones in his preface claims that his songs were the first of the kind, and Rosseter says that those of Campion had been for some time "privately imparted to his friends." Both sets therefore seem to be independent of Caccini's *Nuove musiche*, the influence of which was not felt for some years. In England the break with the past was less violent and sudden than in Italy; for the established practice of arranging popular songs and dances as lute solos led naturally to, and profoundly influenced, the later "ayres" with lute accompaniment. As Dr Walker remarks (*History of Music in England*, p. 121, Clarendon Press, 1907), "A folk-song of 1500, a song of Thomas Campion and a song of Henry Lawes are all bound together by a clear and strong tie." In a simple and unpretentious way these first English attempts at solo-song were singularly successful. The best of them, such as Rosseter's "And would you see my Mistress' face?" and Campion's "Shall I come if I swim?" rank as masterpieces of their kind. Both in structure and in feeling they exactly catch the essentials of the lyrics of the period. Their daintiness and charm make it easy to forgive an air of artificiality, which was after all inevitable—if the songs were to represent the spirit of their environment.[1]

Meanwhile Italian composers, who, in spite of the frottole, villote, villanelle, balletti and falalas (arrangements in vocal parts of popular melodies common in the last half of the 16th century) seem to have been unaffected in the new song movement by popular influences, went straight from the polyphonic to the recitative style, and advanced with extraordinary rapidity. Melody was quickly added to relieve the monotony of recitative which must have been acutely felt by the hearers of the early operas, and considerable advance in this direction was made by Cavalli and Cesti (see *Oxford History of Music*, vol. iii., for details of their methods). Monteverde, though a greater genius than either of them, did not succeed in forcing the daring qualities of his own conceptions on others. The famous lament of Ariadne was the expression of an individual genius casting all rules aside for the sake of poignant emotional effect rather than the beginning of a new epoch in song. Carissimi and Rossi in oratorio and cantata (a word which then merely described a piece that was sung, as sonata a piece that was played, and consisted generally of alternate recitative and aria) brought the organization of melody to a high degree of elaboration, far beyond anything attempted by Cavalli and Cesti. In their hands the declamatory methods of Monteverde were made subordinate to larger purposes of design. A broad and general characterization of emotional situations was more natural to them and to their successors than a treatment in which points are emphasized in detail. It was moreover inevitable in these early developments of musical style, in which melody had to play the leading part, that such sacrifices as were necessary in balancing the rival claims of expression and form should be in favour of the latter rather than the former. But the formal perfection of melody was not the only problem which 17th-century Italian composers had to face. The whole question of instrumental accompaniment had to be worked out; the nature and capacities of instruments, including the voice itself, had to be explored; the reconciliation of the new art of harmony with the old art of counterpoint to be effected. It speaks volumes for the innate musical sense and technical skill of the early Italian composers that the initial stage of tentative effort passed so quickly, and that at the close of the 17th century we are conscious of breathing an atmosphere not of experimental work, but of mature art. Alessandro Scarlatti (1659–1725) sums up the period for Italy. That much of his work is dry, a mere exhibition of consummate technical skill without inspiration, is not surprising when the quantity of it is realized, and also the unfavourable conditions under which operatic composers had to work, but the best of it is singularly noble in conception and perfect in design. The same is true of the best work of Legrenzi, Stradella, Caldara, Leonardo Leo, Durante, work which was of incalculable importance for the development of musical, and particularly of vocal, art, and which will always, for minds attuned to its atmosphere of classical intellectuality, severity and self-restraint, possess an abiding charm: but comparatively few specimens have retained the affections of the world at large. Carissimi's "Vittoria," Scarlatti's "O Cessate" and "Le Violette" are the most notable exceptions ("Pietà Signore" is not included, as no one now attributes it to Stradella).

The almost universal preference of the Italians in the 17th and 18th centuries for the aria in *da capo* form involved serious sacrifices on the dramatic and emotional side: for although this form was but an elaboration of the folk-song type, *ABA*, yet it involved, as the folk-song type did not, the repetition note merely of the melody of the opening part, but of the words attached to it. It is this double repetition which from the point of view of dramatic sincerity forms so disturbing an element. But composers, as has been remarked, were too much occupied with exploring the formal possibilities of melody to establish a really intimate connexion between music and text (Monteverde being a notable exception), a detailed interpretation of which lay outside their scheme of song. Elaboration of melody soon came to involve much repetition of words, and this was not felt as an absurdity so long as the music was broadly in accord with the atmosphere or situation required. A few lines of poetry were thought sufficient for a fully developed aria. Exceptions are however to be found in what is known as the *recitativo arioso*—of which remarkably fine specimens appear in some of Scarlatti's cantatas—and in occasional songs in slighter form than the tyrannous *da capo* aria, such as Caldara's "Come raggio di sol"—which foreshadows with its dignified and expressive harmonies the Schubertian treatment of song.

Before Scarlatti's death in 1725 symptoms of decline had appeared. He was himself often compelled to sacrifice his finer instincts to the popular demand for mere vocal display. A race of singers, who were *virtuosi* rather than artists, dominated the taste of the public, and forced composers to furnish opportunities in each rôle for a full display of their powers. An opera was expected to provide for each favourite five kinds of aria! (*aria cantabile*, *aria di portamento*, *aria di mezzo carattere*, *aria parlante* and *aria d' agilità*). It was not long before easier and more obvious types of melody, expressing easier and more obvious feelings, became the fashion. The varied forms of accompaniment, in which a good contrapuntal bass had been a conspicuous feature, were wasted upon a public which came to hear vocalists, not music; and stereotyped figures, of the kind which second-rate art after the first half of the 18th century has made only too familiar, took the place of sound contrapuntal workmanship,

[1] John Dowland, the chief of English lutenists, published his first book of songs and ayres in four parts in 1597, "So made that all the parts together *or either of them severally* may be sung to the lute, orpherion or viol da gamba." Though not strictly speaking solo-songs they are too important not to be mentioned. Three other books followed in 1600, 1603 and 1612, in the second of which appears the famous "Flow my tears" (Lachrymae) for two voices, but almost equally effective as a solo, and doubtless often used as such. It is published in vol. vii. of *Euterpe* (Breitkopf & Härtel, London), which also contains a valuable monograph on English lutenists and lute music by Miss Janet Dodge. Dowland's few solo-songs are unimportant.

till the Italian school, which had stood as a model for the world, became identified with all that was trivial, insipid, conventional, melodramatic. Not that the Italian tendency in the direction of mere tunefulness was in itself either unhealthy or unworthy. It was indeed a necessary reaction from the severe earlier style, as soon as that style began to lose its earnestness and sincerity, and to pass into cold and calculating formalism. But the spirit of shallowness and frivolity which accompanied the reaction involved the transference of musical supremacy from Italy to Germany, the only country, which, while accepting what was necessary to it of Italian influences, steadily remained true to its own ideals.

Before speaking of German song, it is necessary to glance at what was being done outside of Italy in the 17th century. Reference has already been made to the French as pioneers in establishing solo song to lute accompaniment, which here, as in Italy, originated in adaptations of polyphonic compositions. But in France from the first the main influence was derived from popular sources the native folk-song and the vaudeville, the ditties of country and of town. In both that union of grace, simplicity and charm, characteristic of the French nation, tended to produce an art of dainty unpretentious attractiveness, in strong contrast to the serious and elaborate Italian work. It preserved these characteristics in spite of the artificial atmosphere of the French court, in which it mainly flourished up to the time of the Revolution, in spite too of the somewhat different influences which might have been expected to affect it, derived from opera, the mania for which did not, as in Italy, kill the smaller branch of vocal music. Brunettes, musettes, minuets, vaudevilles, bergerettes, pastourelles, as the *airs de cour* were styled according to the nature of the poetry to which they were attached, may be found in Weckerlin's *Échos du temps passé*, but the reader must beware of judging the real character of these songs from that which they assume under the hands of the modern arranger.

With the latter part of the 18th century came in the languid and sentimental romance, in which the weaker phases of Italian melody are felt as an enervating influence. The romance became after the Revolution the most popular form of polite song, leading by degrees to that purely melodious type of which Gounod may be considered the best representative, and which other composers, such as Godard, Massenet, Widor, have been for the most part content to follow and develop, leaving to more adventurous spirits the excitement of exploring less obviously accessible regions.

In England, as in France and Italy, the beginning of the 17th century brought into existence solo song. Its beginnings have already been alluded to in speaking of the songs of Rosseter, Jones, Campion and Dowland. The work of H. Lawes, and his contemporaries, Wiliam Lawes, Coleman and Wilson, was equally unpretentious and simple. A gem here and there, such as "Gather ye Rosebuds" (W. Lawes), is the student's reward for a mass of uninspired, though not ungraceful, work in which is to be noted an attempt to come to closer quarters with poetry, by "following as closely as they could the rhythmical outlines of non-musical speech: they listened to their poet friends reciting their own verses and then tried to produce artificially exact imitations in musical notes" (Ernest Walker, *History of Music in England*, p. 130), producing what was neither good melody nor good declamation. Such tentative work, in spite of Milton's sonnet to H. Lawes, could only have a passing vogue, especially with a Purcell so near at hand to show the world the difference between talent and genius, between amateurish effort and the realized conceptions of a master of his craft. Songs like "Let the dreadful Engines" and "Mad Bess of Bedlam" reach a level of dramatic intensity and declamatory power, which is not surpassed by the best work of contemporary Italian composers. "I attempt from love's sickness to fly" is so familiar in its quiet beauty that we are apt to forget that melodies so perfectly proportioned were quite new to English art (though Dr Blow's "The Self-banished" deserves fully to stand with it side by side). Monteverde's "Lament of Ariadne" has already been alluded to. It is interesting to contrast its emotional force, obtained by daring defiance of rule, with the equally intense, but more sublime pathos of Purcell's "Lament of Dido," in which song a ground bass is used throughout. The "Elegy on the death of Mr John Playford" (quoted in full by Dr Walker, p. 176 of his history) exhibits the same feature and the same mastery of treatment. The "Morning Hymn" is scarcely less remarkable, and has likewise a ground bass. Purcell died in 1695; Bach and Handel were then but ten years old, and Scarlatti had still thirty years to live—facts of which the significance may be left to speak for itself.

It is among the ironies of musical history that so great a beginning was not followed up. There are echoes of Purcell in the generation that succeeded him, in Croft, Greene, Boyce and Arne: but they quickly died away. The genius of Handel first and of Mendelssohn later seem to have prevented Englishmen from thinking musically for themselves. At least this is the orthodox explanation: but it should be borne in mind that a list of English composers, who have been willing to sacrifice ease and prosperity to a life of devotion to artistic ideals, would be exceedingly difficult to draw up and would certainly not include many of the best-known names. From the death of Purcell to the Victorian era there is no consistent development of artistic song that is worth recording in detail. The only songs that have survived are of the melodious order; of these Arne contributes several that are still acceptable for an air of freshness and gracefulness which marks them as his own. "Where the Bee sucks" and "Blow, blow, thou Winter Wind" are typical of his style at its best, as "The Soldier tired of War's Alarms" is typical of it at its worst. Song writers that followed him, Shield, Hook, Dibdin, Storace, Horn, Linley (the elder) and Bishop, were all prolific melodists, who have each left a certain number of popular songs by which their names are remembered, and which are still pleasant enough to be heard occasionally; but there is no attempt to advance in any new direction, no hint that song could have any other mission than to gratify the public taste for tuneful melodies allied to whatever poetry—pastoral, bacchanalian, patriotic or sentimental—lay readiest to hand.

German Progress.

The musical genius of Germany, which has created for the world the highest forms as yet known of symphony, oratorio and opera, is not less remarkable as the originator of the *Lied*—the term by which are most easily conveyed the modern conceptions of ideal song. Germany is moreover the only country in which in orderly and progressive development the art of song may be traced from the simple medieval *Volkslied* to the elaborate productions of Schubert, Schumann and Brahms. If Germany is united to the rest of Europe in her debt to Italy, still her final conceptions of song belong to herself alone. And these conceptions have more profoundly influenced the rest of Europe than any Italian conception ever influenced Germany. When the rest of Europe was content with the vapid outpourings of Italian and pseudo-Italian puerilities, an acute observer could have read the signs in Germany, from which the advent of a Schubert might have been foretold. The student therefore is more profitably employed in studying the phases of song-development in Germany than in any other country. German ideals and German methods of technique have permeated the best modern song-work of countries differing as widely in idiom as Russia, Norway, France and England.

It is not necessary to dwell, except in very general terms, upon German song of the 17th century. There had been no development corresponding with that which produced the *airs de cour* of France and the ayres of England. The very literature necessary for such development was wanting. Indeed German art was too profoundly affected by the spirit which produced the Reformation to develop freely in secular directions. Even in the domain of the *Volkslied* the sacred songs can scarcely have been less numerous than the secular; and at the Reformation adaptations of secular airs to sacred words constituted borrowings on a very large scale. In the 17th century the work of the Italian monodists was bound eventually to stimulate German composers to make songs, but their main interest lay in larger choral-instrumental works, in which solo songs naturally appear, not in song as an independent branch of art. A good general view of such isolated songs as appeared can be obtained from Reimann's collections *Das deutsche geistliche Lied* and *Das deutsche Lied* (Simrock). In spite of some stiffness and awkwardness, these 17th-century songs exhibit a loftiness of aim, a touching earnestness and sincerity, which mark them off as quite distinct from any work done elsewhere at the same time. On the other hand there is not that sure grasp of their material, nor the melodic and declamatory power, which make Purcell in England stand out pre-eminently as the greatest song composer of the 17th century. The treatment of the aria by Bach and Handel is discussed in separate articles (see ARIA; BACH; HANDEL), which render unnecessary any further comment here. Nor need we pause to consider the vastly inferior work of lesser composers such as Telemann, Marpurg and Agricola, most of which is confined to opera, oratorio and cantata. Our concern is rather with the smaller lyrical forms, and to these the absence of suitable poetry was for long an insurmountable barrier. It was not till the middle of the 18th century that the reform in German poetry associated with the name of Martin Opitz (who translated Rinuccini's text of *Dafne*, J. Peri's first opera, for Heinrich Schütz) bore real fruit.

At the outset it is necessary to make a broad distinction between the more distinctly popular form of song, known as the *Volkstümliches Lied*, in which the same music served for each stanza of a poem (as in the *Volkslied* itself, on which the *Volkstümliches Lied* was modelled), and the *Kunstlied*, or, to adopt the more descriptive term, the *durch-componirtes Lied*, in which the music forms a running commentary on a poem, without respect to its form—or, if stanza form is preserved, varying the music in some stanzas or in all in accordance with their poetical significance. Generally speaking the former aims at a wider audience than the *Kunstlied*, the appreciation of which, when it is worth appreciating, involves some degree of culture and intelligence, inasmuch as it aims as a rule at interpreting more complex and difficult kinds of poetry. In the 18th century the simpler *Volkstümliches Lied* in strophic form was most in favour, and those who care to trace its history in the hands of popular composers like J. A. Hiller, J. A. P. Schulz, Reichhardt, Berger and Zelter, can easily do so by consulting Härtel's *Liederlexicon* (Leipzig, 1867) or one of a number of similar publications. Side by side with the outpouring of somewhat obvious and sentimental melodiousness, which such volumes reveal, it must be remembered that the attention of greater men to instrumental composition, the growing power to compose for keyed instruments (which began to replace the lute in the middle of the 17th century), and the mechanical improvements, through which spinet, clavichord and harpsichord were advancing toward the modern pianoforte, were preparing the way for the modern *Lied*, in which the pianoforte accompaniment was to play an increasingly important part. C. P. E. Bach (d. 1788) alone of his contemporaries gave serious attention to lyrical song, selecting the best poetry he could get hold of, and aspiring to something beyond merely tuneful melody. The real outburst of song had to wait for the inspiration which came with Goethe and Schiller.

It is unfortunate that Haydn and Mozart, pre-eminently endowed with every gift that makes for perfect song except that of literary discernment, should have left us so little of real value. There is indeed much to admire in some of Haydn's canzonets, of which "My Mother bids me bind my Hair" fully deserves its continued popularity, while Mozart's "Schlafe mein Prinzchen"—if it is Mozart's—and a few others, like these in simple strophic form, are isolated treasures which we could not afford to lose. But in only two songs by Mozart, "Abendempfindung" and "Das Veilchen," is the goal, to which the art was to advance, clearly discerned and in the latter case perfectly attained. Both are *durchcomponirt*, that is, they follow the words in detail; in both the general spirit, as well as each isolated point of beauty in the verses, is seized and portrayed with unerring insight. "Abendempfindung" is indeed seriously marred by some carelessness in accentuation (worse examples may be seen in "An Chloe") and by annoying repetition of words, due to the development of the melody into a formal and effective climax. In the process the balance of the poem is destroyed, and the atmosphere of suffused warmth and tenderness, which pervades the rest of the song, is almost lost. The lyrical mood passes into one in which the operatic aria is suggested on the one hand, and on the other the formality of instrumental methods of developing melody. Not till Schubert were these traditions, fatal to the pure lyric, finally overthrown, and the conditions of true union between music and poetry perfectly realized. In "Das Veilchen" however, where Mozart touched a poem that was worthy of his genius and appealed to his extraordinarily fine dramatic instinct, he produced a masterpiece—rightly regarded as the first perfect specimen of the *durch-componirtes Lied*. Every incident in the flower's story is minutely followed, with a detailed pictorial and dramatic treatment (involving several changes of key, contrasts between major and minor, variations of rhythm and melody, declamatory or recitative passages) which was quite new to the art. The accompaniment too takes its full share, illustrating each incident with exquisite fancy, delicacy and discretion—and all with no violence done to the form of the poem.

With Beethoven song was suddenly exalted to a place among the highest branches of composition. Taken in hand with the utmost seriousness by the greatest musician of the age and associated by him for the most part with lyrical poetry of a high order, it could at last raise its head, and, freed from the conventional formalities of the salon, look a larger world confidently in the face. It cannot, however, be admitted that Beethoven, in spite of several noble songs, was an ideal song composer. His genius moved more easily in the field of abstract music. The forms of poetry were to him rather a hindrance than a help. His tendency is to press into his melodies more meaning than the words will bear. The very qualities in fact which make his instrumental melodies so inspiring tell against his songs. Though his stronger critical instinct kept him as a rule from the false accentuation which marred some of the work of Haydn and Mozart, yet, like them, he often failed to escape from the instrumentalist's point of view, especially in the larger song-forms. The concluding melody of "Busselied" would be equally effective played as a violin solo: the same might be said of the final movements of "Adelaide" and of the otherwise noble cycle "An die ferne Geliebte"—movements in which the words have to adapt themselves as well as they can to the exigencies of thematic development, and to submit to several displacements and tiresome repetitions. In songs of a solemn or deeply emotional nature Beethoven is at his best, as in that cycle, to sacred words of Gellert, of which "Die Ehre Gottes aus der Natur" stands as a lasting monument of simple but expressive grandeur, in "Trocknet nicht," in "Partenza," "In questa tomba," in the first of his four settings of Goethe's "Nur wer die Sehnsucht kennt," and more than all, in the cycle "An die ferne Geliebte," which represents a further stage reached in song on the road marked out by Mozart in "Das Veilchen." We have left behind the pretty artificialities so dear to the 18th century, that play around fictitious shepherds and shepherdesses, and entered the field of deeper human feeling with the surrounding influences upon it of nature and romance. The new spirit of the age, represented in German poetry by the lyrics of Bürger, Voss, Claudius and Hölty, members of the famous Göttinger Hainbund, and more notably by those of Goethe and Schiller, communicates itself in Beethoven to song, which now assumes its rightful position of joint interpreter. It needs no deep study of Beethoven's songs to perceive that the accompaniment has assumed, especially in the "Liederkreis," an importance, immeasurably greater than in the songs of any previous composer. It begins to act the part of the chorus in Greek drama and to provide both a background and a commentary to the central personages.

The tentative and uninspired work of Zelter, Reichardt, Schulz and others, when they attempted anything beyond a merely tuneful melody in the strophic form, may be passed over, but a word is due to J. R. Zumsteeg, because in spite of the sometimes childish simplicity of his work he yet, in the kind of use which he made of modulation as a means of lyrical expression, anticipated, more than any other composer of songs, one of the chief features of the greatest song writer of all ages, Franz Schubert. Schubert's "Erlkönig" was written a few months before Beethoven's "Liederkreis," "Gretchen am Spinnrade" about a year before the "Erlkönig." He was eighteen when he composed the latter, in 1815. Lyrical song, divorced from all hindering elements and associations, whether of *salon* or theatre, was here at the threshold of his short career in almost full maturity and plenitude of power. It is sufficiently remarkable that a lad with so little education should have composed such music: it is more astonishing still that he should have penetrated with such unerring insight into the innermost secrets of the best poetry. Two of the necessary qualifications for a great song composer were thus at last united. Schubert possessed the third—a knowledge of the human voice, partly intuitive, partly the result of his experience as a chorister boy. The beauty of his melodies is scarcely more striking than the gratefulness of their purely vocal qualities. The technique of singing had indeed been understood for nearly two centuries; but Schubert was the first to divine fully its emotional range, and to dissociate it in lyrical work from all traditions of the schools. From the beginning to the end of his career he never penned a note or a phrase because it was vocally effective. What he wrote for the voice to sing was there because for him the poetry could not have it otherwise. This was inherent in his method of working, in which he relied implicitly upon his musical inspiration for a response, usually instantaneous, to the inordinate receptivity of his mind to the impressions of poetry. To read through a poem was for him not only to seize its innermost significance, and every salient point of language or of form, but also to visualize the scheme by which both the whole and the parts could be translated and glorified through the medium of music. As the singer Vogl, the first of his profession to appreciate him, remarked, "He composed in a state of *clairvoyance*." Hence the impossibility of summarizing in a short space the innovations he introduced, for new poems invariably suggested new types of song. His settings of Goethe's lyrics (that is, the best of them) differ as essentially from his settings to those of W. Müller in the cycles "Die Schöne Müllerin" and "Die Winterreise," as these again from his settings of Heine. Hardly a single development in subsequent phases of the art (except those which eliminate the melodious element) is not foreshadowed in one or other of his six hundred (and more) songs. Brahms, perhaps the greatest of his successors, said that there was something to be learned from every one of Schubert's songs. He was as perfectly at home in the *durchcomponirtes Lied* as in the simple strophic type or the purely declamatory ("Der Wegweiser," "Nähe des Geliebten," "Der Doppelgänger" may serve as familiar but supreme examples of each). Certain features may be selected for emphasis, first, his use of modulation as a means of emotional expression. "Du liebst mich nicht" traverses in two pages more keys than would serve most composers for a whole symphony, whilst the discords on the words "Die Sonne vermissen" and "Was blüh'n die Narcissen" gave a piercingly thrilling effect, which is quite modern. The modulations in "Wehmuth" illustrate the subtle atmospheric effects which he loved to produce by sudden contrasts between major and minor harmonies. More familiar instances occur in "Gute Nacht," "Die Rose," "Rosamunde." Secondly, his inexhaustible fertility in devising forms of accompaniment, which serve to illustrate the pictorial or emotional background of a poem; we have the galloping horses (and the horn) in "Die Post," the spinning wheel in "Gretchen," murmuring brooks in many songs from "Die Schöne Müllerin" and in "Liebesbotschaft," the indication of an emotional mood in "Die Stadt" or "Litanei." Occasionally, it is true, the persistence of a particular figure and rhythm induces monotony, as in "Ave, Maria!" or "Normans Gesang," but generally Schubert has plenty of means at his command to prevent it, such as the presence of an appropriate subsidiary figure making its appearance at intervals, as in "Halt," "Der Einsame," or some enchanting ritornello, by which a phrase of the vocal melody is echoed in the accompaniment, as in "Liebesbotschaft," "An Sylvia," "Ständchen" and "Fischerweise." Thirdly, the sudden entrance of declamatory passages, as in "Der Neugier'ge," "Am Feierabend," in "Gretchen," at the famous "Ach sein Kuss," and in "Erlkönig" at "Mein Vater, mein Vater." Fourthly, the realistic touches by which suggestions in a poem are incorporated into the accompaniment, such as the cock crowing in "Frühlingstraum," the convent bell in "Die Junge Nonne," the nightingale's song in "Ganymed" or the falling tears in "Ihr Bild." Finally should be noted the extreme rarity of any slips in the matter of the just accentuation of syllables, and this is especially remarkable in a song writer who relies so much upon pure melody as Schubert, for to preserve a perfect melodic outline which shall do not the least violence to a poet's text, presents far more difficult problems than the declamatory style. Yet Schubert is as successful in "Liebesbotschaft" as in "Prometheus." Purists may be disturbed by the repetitions of words involved in the magnificent "Dithyrambe"—but Schubert cannot be expected to betray a sensitiveness which is really post-Wagnerian. Nor is it just to a composer of over 600 songs to fasten for critical purposes on those which do not represent him at his best. His best level is so often attained as to make attacks on points which he has missed—as in some of the songs from Wilhelm Meister—somewhat beside the mark. It is usually the work of enthusiasts who wish to exalt others at Schubert's expense. For further details the reader is referred to the brilliant essay on Song with which Mr Hadow concludes vol. v. of the *Oxford History of Music*. It must suffice here to point out in a general way that in wideness of scope and aim, in intensity of expression Schubert produced the same transformation in the lyrical field that Beethoven had produced in the larger forms of sonata, string quartet and symphony. Beethoven's work was necessary before Schubert could arise, but Schubert's conceptions and methods were the fruit of his own genius. Of his contemporaries Loewe deserves mention for his singular success in overcoming the difficulties involved in setting long ballads to music. To preserve homogeneity in a form in which simple narration presents perpetually shifting changes of action, of picture, of mood, is a problem which Schubert himself only once triumphantly solved. Weber contributed nothing to song, except in his operas, of permanent value, beyond a few strophic songs of a popular nature. He disqualified himself for higher work by that singular preference for vapid and trivial verse which so often led Haydn and Mozart astray. Mendelssohn's literary tastes took him to the best poetry, but he made but little attempt as a rule, to penetrate beyond its superficial and obvious import. His own lovable personality is far more clearly revealed in his songs than the spirit of his poets. Differences of literary style affected the style of his music perhaps less than that of any other distinguished composer. He attained his highest level in "Auf Flügeln des Gesanges," the first of the two songs to Zuleika, and Nachtlied. It is noteworthy that there is no trace of Schubert's influence. Had Schubert not lived, Mendelssohn's songs would have been just the same. Hence in spite of graceful and flowing melodies, elegant but simple in form, and instinct with that polished taste and charm of manner which endeared both himself and his works to his own generation, his songs have exercised no permanent influence upon the art. Their immediate influence, it is true, was enormous: it is felt occasionally in Schumann, only too often in Robert Franz, and a host of lesser composers in many countries besides his own, such as Gade, Lindblad, Sterndale Bennett, and others who need not be specified.

Of far greater importance is the work of Robert Schumann, whose polyphonic methods of technique and peculiarly epigrammatic style enabled him to treat complex phases of thought and feeling which had hardly become prominent in Schubert's time with quite extraordinary success. Both by temperament and by choice he is identified with the so-called romantic movement, a movement in which both poetry and music have tended more and more to become rather a personal revelation than "a criticism of life." Thus with Schubert the note of universality, the abiding mark of the classical composers, is stronger than the impress of his own personality. With Schumann the reverse is the case. If the romantic movement gave a new impetus of vast importance both to music and literature, yet it had its weaker side in extremes of sensibility, which were not always equivalent to strength of feeling. Mendelssohn's songs admittedly err on the side of pure sentimentality—Schumann, with Liszt, Jensen and Franz, frequently betrays the same weakness, but his best work, his settings to Heine (especially the *Dichterliebe*), the *Eichendorff* "Liederkreis," Chamisso's "Frauenliebe u. Leben" (with some reservations), besides a fair number of other songs, such as "Widmung," "Der Nussbaum," "Ihre Stimme," and his one completely successful ballad, "Die beiden Grenadiere," are strong in feeling and full of poetic and imaginary qualities of the very highest order. The new poetry called for new methods of treatment. These Schumann, instinctively an experimenter, provided, first, by a closer attention to the minutiae of declamation than had hitherto been attempted—and herein syncopation and suspension furnished possibilities unsuspected even by Schubert—secondly by increasing the rôle of the pianoforte accompaniment—and in this he was helped on the one hand by novel methods of technique, of which himself and Chopin were the chief originators, and on the other by his loving study of Bach, which imparted a polyphonic treatment, quite new to song. In nearly all Schubert's songs, and in quite all of Mendelssohn's, the melody allotted to the voice maintained its position of supremacy. In Schumann it not infrequently becomes the secondary factor, the main rôle of lyric interpreter passing to the accompaniment, as in "Es ist ein Flöten u. Geigen" or "Röselein." He also gave quite a new prominence to the opening and closing instrumental symphonies, which become in his hands no merely formal introduction or conclusion but an integral part of the whole conception and fabric of the *Lied*. This may be illustrated by many numbers of the *Dichterliebe*, but most remarkable is the final page, in which the pianoforte, after the voice has stopped, sums up the whole tenour of the cycle. This feature has been seized upon by many subsequent composers, but by few with Schumann's rare insight and judgment. In Franz, for instance, the concluding symphony is often introduced without necessity, and becomes a mere irritating mannerism. In Brahms however it is developed, both at the opening and close of many songs, to an importance and pregnancy of meaning which no other composer has attained.

A third point in Schumann's method is his fondness for short interrupted phrases (often repeated at different levels) in place of the developed Schubertian melodies; it is alluded to here because of the great extension of the practice by later composers, too often, as in the case of Franz, without Schumann's tact. On many grounds, then, Schumann may be regarded as having widely extended the conception of the *Lied*; his example has encouraged later composers to regard no lyric poetry as too subtle for musical treatment. Unfortunately in presenting complexity of mood Schumann was not invariably careful to preserve structural solidity. Many later composers have followed the occasional looseness of design which is his fault, without approaching the beauty of spirit, in which he stands alone.

A bold experimenter in song was Franz Liszt, whose wayward genius, with its irrepressible bent towards the theatrical and melodramatic, was never at home within the limits of a short lyric. It is true that there is sincerity of feeling, if not of the deepest kind, in "Es muss ein Wunderbares sein" and "Über allen Gipfeln"; but concentrated emotion, which involves for its expression highly organized form, was alien to Liszt's genius, which is more truly represented in songs like "Die Lorelei," "Kennst du das Land," "Am Rhein"—in which are presented a series of pictures loosely connected, giving the impression of clever extemporizations on paper. It is not sufficiently recognized that such work is far easier to produce than a successful strophic song, even of the simplest kind, because the composer ignores the fact that a formal lyric implies formal music, and that the most formal poetry is often the most emotional. Critics, who measure the advance of song by the increase in number of those that are *durchcomponirt*, and the decreasing output of those which have the same music to each stanza, are in danger of forgetting the best qualities both of music and of poetry. Formless music never interpreted a finely formed poem, and unless the *durchcomponirtes Lied* has more form instead of less than the strophic song, it is artistically valueless. The popularity therefore of "Die Lorelei" is not so much a tribute to Liszt's genius as an example of the extent to which gifted singers and undiscerning critics can mislead the public. Mere scene painting, however vivid, however atmospheric—and these qualities may be conceded to Liszt and to others who have followed his example—takes its place upon the lower planes of art.

The admiration expressed by Liszt and Wagner for the songs of Robert Franz, and the cordial welcome extended by Schumann to those which first made their appearance, have led to an undue estimate of their importance in many quarters. They are characterized by extreme delicacy both of feeling and of workmanship, but the ingenuity of his counterpoint, which he owed to his intimate knowledge of Bach and Handel, cannot conceal the frequent poverty of inspiration in his melodic phrases nor the absence of genuine constructive power. To build a song upon one or two phrases repeated at different levels and coloured by changing harmonies to suit the requirements of the poetic text (as in "Für Musik" and "Du bist elend") is a dangerous substitute for the power to formulate large and expressive melodies. But it is the method which Franz instinctively preferred and elaborated with skill. His songs are mostly very short and in the strophic form, some alteration being nearly always reserved to give point to the last verse. His tricks of style and procedure so quickly become familiar as to exhaust the patience even of the most sympathetic student. But the sincerity of his aims, the idealistic and supersensitive purity of his mind (which banished as far as possible even the dramatic element from his lyrics), its receptiveness to the beauties of nature and all that is chaste, tender and refined in human character render his songs an important contribution to our knowledge of the intimate side of German feeling, and compensate in some degree for the lack of the larger qualities of style and imagination. All his best qualities are represented in the beautiful setting of Lenau's "Stille Sicherheit." Those who care to study his limitations may compare his settings of Heine's lyrics with the masterpieces of Schumann in the same field, or the dulness of his "Verborgenheit" (Mörike) with the romantic fervour imparted to that poem by the later genius of Hugo Wolf.

A higher value than is usually conceded attaches to the songs of Peter Cornelius, a friend of Liszt and Wagner, but a follower of neither. Before he came under their influence he had undergone a severe course of contrapuntal training, so that his work, though essentially modern in spirit, has that stability of structure which makes for permanence. He was, moreover, an accomplished linguist, a brilliant essayist, and a poet. That perfect fusion between poetry and music, which since Schubert has increasingly been the ideal of German song, is realized in an exceptional manner when, with Cornelius as with Wagner, librettist and musician are one person. More exquisite declamation is hardly to be found in the whole range of song than in the subtly imaginative "Auftrag," whilst for nobility of feeling, apart from technical excellencies of the highest order, the "Weihnachtslieder," the "Brautlieder" and much of the sacred cycle "Vater Unser," are hardly surpassed even by Schumann at his best, and point to Cornelius as one of the most beautiful and original spirits of the 19th century.

In the song-work of the 19th century, though Schubert remains the rock upon which it has been built, Schumann represents the most directly inspiring influence, even when, as in the case of Adolph Jensen (whose spontaneously melodious and graceful, if not very deep, songs deserve mention), there are importations from such widely divergent sources as those of Mendelssohn and Wagner.

The application of the principles of Wagnerian music-drama to lyrical work, allied, as was natural, with the exaggerations and unconventionalities of Liszt and Berlioz, was sooner or later bound to come, bound also for a time to issue in confusion; to rescue song from which was the work of two men of genius, who, though approaching the task from standpoints removed by the whole distance of pole to pole, may be considered as placing the crown of final achievement upon the aspirations of 19th-century song—Hugo Wolf and Johannes Brahms.

Wolf exhibits an entirely unconventional and original style. He is as untroubled by tradition as Schubert, whom he resembles not often, as in "Fussreise," and "Der Gärtner," in pure melodiousness, but in the intensity of his power to penetrate to the very heart of poetry. To him may also be most fitly applied the epithet *clairvoyant*. He is the first who published songs for voice and pianoforte, not songs with pianoforte accompaniment, thus finally asserting the identity of singer and accompanist in true lyrical interpretation.

The unerring sagacity of Brahms discerned that the possibilities of song on the lines set by Schubert were far from being exhausted: his practical mind preferred to develop those possibilities rather than to seek after strange and novel methods, conforming thus in song to his practice in other branches of composition. A broad melodic outline is for him an essential feature: equally essential is a fine contrapuntal bass. In form the majority of his songs follow the orthodox A B A pattern, the central portion being so organized as to offer, with the least possible introduction of new unrelated material, a heightened contrast with the opening portion by means of new treatment and new tonalities and at the same time to justify itself by producing the mood in which the return to the opening portion is felt as a logical necessity. Chromatic effects in Brahms's scheme of melody are rarely introduced till the middle section, the opening being almost invariably diatonic. It must however be admitted that Brahms's formal perfection involves occasionally an awkward handling of words, and that in a few instances (see *Magelone-lieder*, Nos. 3 and 6), they are frankly sacrificed to that formal development of his material which has been criticized in the cases of Mozart and Beethoven. No part of his songs deserves closer study than the few bars of instrumental prelude and conclusion, in which is enshrined the very essence of his conception of a poem. It may almost be said that, since Schumann set the example, the first and the last word has passed from the voice to the instrument. Accompanist, like singer, must understand poetry as well as music: but with no composer is his responsibility greater than with Brahms. Complete mastery in close organization of form was allied in Brahms not only with the warmth and tenderness of romance, but with the imagination and insight of a profound thinker. Concentration of style and of thought have nowhere in the whole history of song been combined on a plane so high as that which is reached, with all perfection of melodic and harmonic beauty, in "Schwermuth," "Der Tod das ist die kühle Nacht," "Mit vierzig Jahren," "Am Kirchhof," "O wüsst' ich doch den Weg zurück" and the "Vier ernste Gesänge," which closed the list of his 197 songs. The alliance to song of so dangerous a companion as philosophy, or at any rate of thoughts which are philosophical rather than lyrical, proved no obstacle to Brahms's equal success in the realm of romance. This side of his genius may be illustrated by numerous songs from the Magelone cycle (notably "Wie froh und frisch" and "Ruhe, süss, Liebchen") and by others, of which "Liebestreu," "Die Mainacht," "Feldeinsamkeit," "Wie rafft' ich mich auf in der Nacht," "Minnelied" and "Wir wandelten" are a few examples picked at random.

It has already been indicated that Brahms was a deep student of Schubert. If he had not Schubert's absolute spontaneity of melody, he restored it to its Schubertian place of supreme importance. In spite of all the tendencies of his age he never shirked that supreme test of a composer, the power to originate and organize melody: but it is melody often of a type so severe in its outline and proportions as to repel those hearers who are unable to attain to his level of thought and feeling. All mere prettiness and elegance are as alien to his nature as even the slightest approach to sentimental weakness on the one hand, or to realistic scene-painting on the other, so that for the world at large his popularity is jeopardized by an attitude which is felt to be uncompromisingly lofty and severe. It has hardly yet had time to reconcile itself to the union of modern lyrical poetry with a style whose elaborate contrapuntal texture differs as much from the delicate polyphony of Schumann as that in its turn differed from the broad harmonic system of Schubert. But that Brahms was never difficult without reason, or elaborate when he might have been simple, appears plainly from the preference he felt for his slighter songs in the *Volkstümlich* style and form, rather than for those which were *durchcomponirt*. He was strongly influenced by the *Volkslieder* of his country, the words of which he loved to repeat to himself, as they suggested ideas even for his instrumental compositions. His arrangements of *Volkslieder* mark an epoch in that field of work.[1]

In the history of song Brahms's name is likely to stand for the closing of a chapter. It is difficult to conceive of more complete work on lines that are essentially classical. The soundest traditions find in him their justification and their consummation. He has enshrined the best thought and the noblest feeling of his age in forms where elaboration and complexity of detail serve essential purposes of interpretation, and are never used as a brilliant artifice to conceal foundations which are insecure.

It is not proposed to discuss the work and tendencies of contemporary German composers—of whom Felix Weingartner (b. 1863), Max Reger (b. 1873) and Richard Strauss have attracted the largest share of attention. The above summary, though necessarily incomplete and confined only to the most conspicuous names, may yet provide some points of view from which the songs of other countries than Germany may be regarded, especially those in which German conceptions and German methods of technique have been dominant factors. Actual settings of German lyrics figure largely in the works of many non-German composers, and these it is hard to judge except by German standards. But, strongly as German influence has been felt in Russia, for instance, in Norway and in Finland, yet the last half century has seen the rise of more distinctly national schools of song in all these countries, and to this result the cult of the folk-song has very largely contributed. Glinka, Rimsky-Korsakov, Borodin, Balakirev, César Cui (b. 1835), and Moussorgsky in Russia, Nordraak (1842–1866) and Grieg in Norway, Sibelius (b. 1865) in Finland, are conspicuous names in this connexion.

Modern French Song.

The Latin countries have, as is natural, been but little subject to German influences; of these France alone seems to be working her way towards a solution of artistic problems which has interest for those who live beyond her borders and which bears emphatically her own hallmark. The melodious style of Gounod, which has so powerfully affected composers like Massenet, Godard and Widor, has

[1] Their value may be tested by comparing them with the small volume containing arrangements by R. Franz, which are sympathetically done but without inspiration, with those of Tappert, which are models of what such things ought not to be, and with the dull, uninviting work of A. Saran. Many of Reimann's arrangements, however, deserve cordial recognition as both sympathetic and scholarly. One fact emerges clearly from the study of folk-song arrangements, in Germany and elsewhere, that success depends upon qualities which are as rare as, and are seldom dissociated from, the power of original composition. Only a great composer can be a great arranger.

begun to yield during the last quarter of a century to tendencies which correspond closely with those of the impressionist movements in French literature and painting. The deeper side of the movement, in which a strong element of mysticism plays an important part, is represented in the best songs of César Franck, Fauré and Bruneau, a notable group of composers, whose occasional extravagances are atoned for by original impressions of nature in her more unusual moods, and by much that arrests attention both in thought and style. The songs of Duparc (b. 1848) and Vincent d'Indy likewise repay study. Nothing can be clearer than that traditional methods were inadequate, if modern French poetry was to find interpretation in the sister sphere of music; but how far the work of composers such as those named is likely to be regarded as final, it is premature to ask. The world had hardly had time to feel at home with them before it was called upon to face what it is difficult not to regard as representing the extreme limits of impressionistic style in Debussy. We are still too much accustomed to melody and rhythm, to harmonies that have some intelligible principle in their successions, to judge securely of music which is neither melodious nor rhythmical nor in the accepted sense harmonious. We are still too much accustomed to music regulated by analysable laws to feel at ease with music that seems, at any rate at present, to acknowledge none. Whether the work of Debussy is the beginning of a new epoch the future alone can decide, but it is permissible to feel apprehensive of an art which is based upon impressions rather than upon convictions; and the value of impressions is apt to be measured more by the degree in which they are fugitive, elusive, evanescent, or merely peculiar to the composer's temperament, than by the relation which they bear to permanent elements in nature or humanity. Hence in the modern school of song-writers, which finds its culmination in Debussy, the quality of unselfconsciousness is the one which seems most difficult for them to attain. In French art we are too often reminded how close the sublime is to the ridiculous, the dramatic to the theatrical, pathos to bathos, truth to paradox. Even in the quieter pictures we are conscious of a forced atmosphere, an unnatural calm, not the abiding peace of a landscape by Corot or Millet. Lastly, the opinion of Bruneau (*La Musique française*, p. 233) that prose will in time supplant poetry in drama and song is, at least to those to whom form is still an essential element of beauty, a disquieting omen for the future. The best qualities of the French nation, its unaffected gaiety, its sincerity, grace, humour, pathos, tenderness, are far more touchingly and truthfully revealed in the simple melodies of the country-side—or in the less pretentious songs (of which Bruneau and Massenet have given examples, as well as many others) formed upon their model.

Limitations of space do not form the only reason for dealing in a cursory manner with English songs of the 19th century.

Modern English Song.

A more valid one is to be found in the absence, until its two closing decades, of great names to which can be attached the history of any orderly development, of any well-conceived and definite ideals. The authors of the very limited number of good songs are too often the authors of others in larger quantities which are bad, and that not in every case owing to failure of inspiration but to a lowering of ideals in order to gratify the tastes of an unintelligent public on the one hand, and the demands of exacting publishers on the other. That a healthier art might have arisen is indicated by the presence of such songs as Hatton's "To Anthea," Loder's unexpectedly fine setting of "The Brooklet" (the words of which Schubert had already immortalized in its original German version as "Wohin"), Sullivan's fresh and original settings of several Shakespearian lyrics, and of Tennyson's uninspired cycle of verses entitled "The Songs of the Wrens," and Clay's "I'll sing thee songs of Araby." The name of Sterndale Bennett stands out as that of a composer who remained steadfastly true to his ideals. His output was indeed a small one, and covered a somewhat limited range of style and feeling: but the thought, like the workmanship, is always of delicate and beautiful quality. Though Mendelssohn's influence is apparent he has a touch which is all his own. "To Chloe in sickness," "Forget-me-not," "Gentle Zephyr" and "Sing, Maiden, sing," have certainly not yet lost their charm. Sterndale Bennett marks the beginning of higher ideals in English song—but it is only within the last twenty-five years that we have begun to see their realization, owing to the training of many English musicians in German schools and to the increasing familiarity of the musical public with the best German *Lieder*. The lead has been taken by Parry and Stanford—composers who have published large numbers of songs in great variety of styles, and with uniform seriousness of aim and treatment. Parry's delightfully fresh early work is represented at its best in "A Spring Song," "A Contrast," and "Why does azure deck the skies?" The transition to a later manner is marked by the four anacreontic odes; and several small volumes of lyrics have since made their appearance. If some of these miss the true lyrical note, of which absolute spontaneity is an essential condition, yet a lofty level of thought and workmanship is always manifest, rising to highest inspiration perhaps in "When we two parted," "Through the ivory gate," and "I'm weaving Sweet Violets." Stanford has essayed songs in many styles, suited to poems drawn from many periods, but he is most himself and most successful in Keats's weird and dramatic ballad "La Belle dame sans merci," in Browning's cavalier songs, in the cycle of sea songs (H. Newbolt) and above all in the Irish idyll (Moira O'Neill)—where in six pieces of rarest beauty the composer has revealed different phases of Irish feeling, pathos and humour with a poetical and imaginative power unequalled in British art. It is hard to imagine a more perfect alliance between poetry and music, from the general conception of each song down to the minutest detail of declamation, than is found here. As an arranger of Irish melodies—of which four volumes have been published—Stanford has also shown himself a complete master. Cowen, Mackenzie and Elgar have contributed few songs worthy of reputations gained in larger forms of composition. Of the work done and being done by younger composers much might be said. There is activity in many directions; a cycle of songs by Arthur Somervell from Tennyson's *Maud* is an artistic work of very real value, beautiful and original as music, and forming a highly interesting commentary upon the poem. R. Vaughan Williams, in the more difficult task of setting six sonnets from Rossetti's *House of Life* and in three of Stevenson's *Songs of Travel*, has displayed imaginative qualities of a remarkable order. Not less original is the highly finished and poetical work of H. Walford Davies. Somewhat slighter in style and thought, but instinct with true lyrical tenderness and charm, are the songs of Roger Quilter, drawn mainly from the Elizabethan period, and the poems of Herrick. Various songs by Maude V. White, W. H. Hadow, Hamilton Harty, Harold Darke, Ernest Walker, Donald Tovey, William Wallace and others give evidence, with the work already mentioned, of a revolution in the treatment and conception of song in England, which is full of promise for the future. Its fulfilment however is likely to depend upon a change in the prevailing conditions, under which professional vocalists have a financial interest in popularizing inferior productions. Good songs, apart from the initial difficulty of finding a publisher, are thus penalized from the start, whilst the larger and less instructed portion of the public, which forms its taste upon what the singers of the day provide, remains ignorant of precisely those works which are most necessary for its enlightenment.

Bibliography.—In Grove's *Dictionary of Music and Musicians* (new ed.) Mrs E. Woodhouse's article on "Song" (vol. iv.) gives a practically exhaustive bibliography of the whole subject of song and folk-song, country by country; her account is quite unique, and indispensable to the student. The following list is mainly of books which the present writer has found most valuable: Sir Hubert Parry, *Art of Music* (London, 1897); *Oxford History of Music* (1901–1905), esp. vol. iii.; "The Seventeenth Century" by Sir Hubert Parry, vol. iv.; "The Age of Bach and Handel" by J. A. Fuller-Maitland, vol. v.; "The Viennese Period" by W. H. Hadow, vol. vi.; "The Romantic Period" by E. Dannreuther; Combarieu, *La Musique, ses lois et son évolution* (Paris, 1907); Ambros, *Geschichte der Musik* (1862–1882); Coussemaker, *Histoire de l'harmonie au moyen*

âge (1852); Kiesewetter, *Schicksale u. Beschaffenheit des weltlichen Gesanges* (1841); Reissmann, *Das deutsche Lied* (1861; rewritten as *Geschichte des deutschen Liedes*, 1874); Schneider, *Das musikalische Lied* (1863); E. Walker, *History of Music in England* (1907); W. Nagel, *Geschichte der Musik in England* (1894–1897); C. J. Sharp, *English Folk-songs, some Conclusions* (1907); J. Tiersot, *Histoire de la chanson populaire en France* (1889); Lavoix, *La Musique française* (1891).

Collections of songs with valuable introduction and notes (those marked with an asterisk have pianoforte accompaniments): F. M. Boehme, *Altdeutsches Liederbuch* (Breitkopf & Härtel, 1877); Gaston Paris and Gevaert, *Chansons du XV^e siècle* (Paris, 1875); J. Tiersot, *Chansons populaires des Alpes françaises* (Grenôble, 1903); De la Villemarqué, *Barzaz-Breiz, Chansons pop. de la Bretagne* (Paris, 1867); *Bourgault-Ducoudray, *30 melodies pop. de la Basse-Bretagne* (Paris, 1885); *Champfleury and Weckerlin, *Chansons pop. des provinces de France* (Paris, 1860); *Weckerlin, *Echos du temps passé* (3 vols., Paris, 1855), and **Chansons pop. du pays de France* (2 vols. Paris, 1903); *V. D'Indy, *Chansons pop. du Vivarais*, op. 52 (Paris); Hjalmar Thuren, *Folkesangen paa Faererne* (Copenhagen, 1908); F. van Duyse, *Het oude nederlandsche Lied* (The Hague, 1903–1905); *E. Closson, *Chansons pop. des provinces belges* (Brussels, 1905); *Bourgault-Ducoudray, *30 melodies pop. de Grèce et d'orient* (Paris, 1897); Eugénie Lineff, *Peasant Songs of Great Russia* (St Petersburg and London, 1905); *W. Chappell, *Popular Music of the Olden Time* (London, 1855–1859); *E Wooldridge, revised edition of the above, with title *Old English Popular Music* (London, 1893); Folk-song Society's Journals; *C. J. Sharp, *Folk-songs from Somerset* (5 vols., Barnicott & Pearce, Taunton); *J. A. Fuller-Maitland and L. E. Broadwood, *County Songs* (Novello); *Sharp and Baring-Gould, *Songs of the West* (Methuen); *L. E. Broadwood, *English Traditional Songs and Carols* (Boosey). (W. A. J. F.)

The Song of Birds

The characteristic modulated voice of birds is the outstanding example of natural "song" in the animal world. The essential requirements of a vocal organ, the pressure of vibratory membranes or chord, are found in the bird's *syrinx* (see Bird), but how these membranes act in particular, and how their tension is modified by the often numerous syringeal muscles, we do not know. The voice of birds is produced entirely by the syrinx; the larynx no doubt modifies it, but the tongue seems to play no part in it. The "loosening of the tongue" by cutting its *frenum*, in order to assist a bird in talking &c., is an absolutely silly operation. The possession of the most elaborate syrinx is not enough to enable a bird to sing. In this respect they are like ourselves: special mental faculties are required to control the apparatus. Anatomically the raven has the same elaborate syrinx as the thrush or the nightingale, and yet the raven cannot "sing" although it can modulate its voice and can even learn to talk. As a rule the faculty of singing is restricted to the males, although the females possess the same organs; moreover, birds vary individually. Some learn to sing marvellously well, while others remain tyros in spite of the best education. But given all the necessary mental faculties, birds sing only when they are in such a healthy condition that there is a surplus of energy. This, of course, is greatest during the time of propagation, when much of the surplus of the general metabolism comes out—to use homely words—in unwonted functions, such as dancing, posing, spreading of feathers and giving voice. Every one of these muscular exertions is a spasm, releasing some energy, and—again in homely parlance—relieving the mind. In many cases these antics and other manifestations become rhythmical, and music consists of rhythmical sounds. Of course birds, like other creatures, are to a certain extent reflex machines, and they often sing because they cannot help it, just as male frogs continue to croak long after the pairing season, and not necessarily because they or their mates appreciate those sounds. But birds stand mentally on such a high level that we can scarcely doubt that in many cases they enjoy, and therefore sing their song. Many a tame bird, a canary, starling, magpie, will repay its keeper with its song, out of season, for any kindness shown to it, or for his mere presence.

If we regard any sound made by a bird under the all-powerful influence of love or lust as its "song," then probably every bird is possessed of this faculty, but in the ordinary acceptance of the term very few, besides the oscines, can sing, and even this group contains many which, like the ravens and the crows, are decidedly not songsters. On the other hand, it seems unfair not to call the charming series of notes of the dove its song.

D. Barrington in a very remarkable paper ("Experiments and Observations on the Singing of Birds," *Phil. Trans.*, 1773, pp. 249–291) defines a bird's song "to be a succession of three or more different notes, which are continued without interruption during the same interval with a musical bar of four crotchets in an adagio movement, or whilst a pendulum swings four seconds." The late A. Newton (*Ency. Brit.*, 9th ed., iii. 771; see also *Dict. Birds, s.v.* "Song," pp. 892–894), taking a much wider view of "song," proceeds as follows:—

"It seems impossible to draw any but an arbitrary line between the deep booming of the emeu, the harsh cry of the guillemot (which, when proceeding from a hundred or a thousand throats, strikes the distant ear in a confused murmur like the roar of a tumultuous crowd), the plaintive wail of the plover, the melodious whistle of the wigeon, 'the cock's shrill clarion,' the scream of the eagle, the hoot of the owl, the solemn chime of the bell-bird, the whip-cracking of the manakin, the chaffinch's joyous burst, or the hoarse croak of the raven, on the one hand, and the bleating of the snipe or the drumming of the ruffled grouse, on the other. Innumerable are the forms which such utterances take. In many birds the sounds are due to a combination of vocal and instrumental powers, or, as in the cases last mentioned, to the latter only. But, however produced—and of the machinery whereby they are accomplished there is not room here to speak—all have the same cause and the same effect. The former has been already indicated, and the latter is its consummation. Almost coinstantaneously with the hatching of the nightingale's brood the song of the sire is hushed, and the notes to which we have for weeks hearkened with rapt admiration are changed to a guttural croak, expressive of alarm and anxiety, inspiring a sentiment of the most opposite character. No greater contrast can be imagined, and no instance can be cited which more completely points out the purpose which 'song' fulfils in the economy of the bird, for if the nightingale's nest at this early time be destroyed or its contents removed, the cock speedily recovers his voice, and his favourite haunts again resound to his bewitching strains. For them his mate is content again to undergo the wearisome round of nest-building and incubation. But should some days elapse before disaster befalls their callow care, his constitution undergoes a change and no second attempt to rear a family is made. It would seem as though a mild temperature, and the abundance of food by which it is generally accompanied, prompt the physiological alteration which inspires the males of most birds to indulge in the 'song' peculiar to them. Thus after the annual moult is accomplished, and this is believed to be the most critical epoch in the life of any bird, cock thrushes, skylarks, and others begin to sing, not indeed with the jubilant voice of spring but in an uncertain cadence which is quickly silenced by the supervention of cold weather. Yet some birds we have which, except during the season of moult, hard frost, and time of snow, sing almost all the year round. Of these the redbreast and the wren are familiar examples, and the chiffchaff repeats its two-noted cry, almost to weariness, during the whole period of its residence in this country.

"Akin to the 'song of birds,' and undoubtedly proceeding from the same cause, are the peculiar gestures which the males of many perform under the influence of the approaching season of pairing, but these again are far too numerous here to describe with particularity. It must suffice to mention a few cases. The ruff on his hillock in a marsh holds a war-dance. The snipe and some of his allies mount aloft and wildly execute unlooked-for evolutions almost in the clouds. The woodcock and many of the goatsuckers beat evening after evening the same aerial path with its sudden and sharp turnings. The ring-dove rises above the neighbouring trees and then with motionless wings slides down to the leafy retreat they afford. The capercally and blackcock, perched on a commanding eminence, throw themselves into postures that defy the skill of the caricaturist—other species of the grouse-tribe assume the strangest attitudes and run in circles till the turf is worn bare. The peacock in pride spreads his train so as to show how nearly akin are the majestic and the ludicrous. The bower-bird, not content with its own splendour, builds an arcade, decked with bright feathers and shining shells, through and around which he paces with his gay companions. The larks and pipits never deliver their song so well as when seeking the upper air. Rooks rise one after the other to a great height and, turning on their back, wantonly precipitate themselves many yards towards the ground, while the solemn raven does not scorn a similar feat, and, with the tenderest of croaks, glides supinely alongside or in front of his mate."

The following may be cited as the principal treatises on the subject, besides Barrington's paper quoted above: J. Blackwall, Mem. Litt. Phil. Soc., Manchester (1824), pp. 289–323; also in Froriep's *Notizen* (1825), col. 292–298; F. Savart, *Mémoir sur la voix des oiseaux*, Froriep's *Notizen* (1826), col. 1–10; C. L. Brehm, *Naumannia* (1855), pp. 54–59, 96–101, 181–195; and *Journ. f. Ornith.* (1855, pp. 348–351; 1856, pp. 250–255); C. Gloger, *Journ. f. Ornith.* (1859), pp. 439–459; J. E. Harting, *Birds of Middlesex* (London, 1866), where the notes of many of the common English birds are musically expressed; J. A. Allen, *Bull. Comp. Zoöl. Harvard* (1871), ii. 166–450; L. Paolucci, *Il Canto degli uccelli* (Milan, 1878), and *Milano soc. ital. atti.* 20 (1877), pp. 125–247; C. L. Hett, *A Dictionary of Bird Notes* (Brigg, 1898); C. A. Witchell, *Bird-Song and its Scientific Teaching* (Gloucester, 1892); F. S. Mathews, *Field Book of Wild Birds and their Music* (New York, 1904). See also W. Warde Fowler, *A Year With the Birds* (1886). (H. F. G.)

SONGHOI, SONRHAY, SURHAI, &c., a great negroid race inhabiting a large tract of country on both banks of the middle Niger. They formed a distinct state from the 8th to the 16th century, being at one period masters of Timbuktu (*q.v.*) and the most powerful nation in the western Sudan. The origin of this people, who are said still to number some two millions, though their national independence is lost, has been a source of much dispute. Heinrich Barth, who has given the fullest account of them, reckoned them as aborigines of the Niger valley; but he also tried to connect them with the Egyptians. The people themselves declare their original home to have been to the eastward, but it seems unlikely that they or their culture are to be connected at all with the Nile valley. According to the *Tarik ê Sudan*, a 17th century history of the Sudan written by Abderrahman Sadi of Timbuktu, the first king of the Songhoi was called Dialliaman (Arabic *Dia min al Jemen*, "he is come from Yemen"), and the account given in this Arabic manuscript leaves little doubt that he was an Arab adventurer who, as has been frequently the case, became chief of a negro people and led them westward. The Songhoi emigration must have begun towards the middle of the 7th century, for Jenné, their chief city, was founded one hundred and fifty years after the Hejira (about A.D. 765), and it represents the extreme western point in their progress. From a hundred to a hundred and twenty years would be about the time which must be allowed for the years of wandering and those of settlement and occupation in the Songhoi countries. In the north they have mixed with the Ruma "Moors," and in the south with the Fula. The Songhoi, then, are probably Sudanese negroes much mixed with Berber and even Arab blood, who settled among and crossed with the natives of the Niger valley, over whom they long ruled.

In their physique they bear out this theory. Although often as black as the typical West African, their faces are frequently more refined than those of pure negroes. The nose of the Songhoi is straight and long, pointed rather than flat; the lips are comparatively thin, and in profile and jaw projection they are easily distinguishable from the well-known nigritic type. They are tall, well-made and slim. In character, too, they are a contrast to the merry light-heartedness of the true negro. Barth says that of all races he met in negroland they were the most morose, unfriendly and churlish. The Songhoi language, which, owing to its widespread use, is, with Hausa, called *Kalam al Sudan* ("language of the Sudan") by the Arabs, is often known as Kissur. According to Friedrich Müller it resembles in structure none of the neighbouring tongues, though its vocabulary shows Arab influence. Keane states that the language "has not the remotest connexion with any form of speech known to have been at any time current in the Nile valley."

See Heinrich Barth, *Travels and Discoveries in Northern and Central Africa* (1857–1858); A. H. Keane, *Man Past and Present* (Cambridge, 1899); Brix Förster in *Globus*, lxxi. 193; Felix Dubois, *Timbuctoo the Mysterious* (1897); Lady Lugard, *A Tropical Dependency* (1905).

SONNEBERG, a town of Germany, in the duchy of Saxe-Meiningen, situated in a narrow valley of the Thuringian forest, 13 m. by rail N.E. of Coburg. Pop. (1905), 15,003. It is famous for its manufacture of toys; its other industries are the making of glass and porcelain articles, electrical works and breweries. The town possesses a fine Gothic church, and a hydropathic establishment.

SONNENTHAL, ADOLF VON (1834–1909), Austrian actor, was born of Jewish parentage in Budapest on the 21st of December 1834. Though brought up in penury and apprenticed to a working tailor, he yet cultivated the histrionic art, and was fortunate in receiving the support of a co-religionist, the actor Bogumil Dawison, who trained him for the stage. He made his first appearance at Temesvar in 1851, and after engagements at Hermannstadt and Graz came in the winter of 1855–1856 to Königsberg in Prussia, where his first performance was so successful that he was engaged by Heinrich Laube for the Burgtheater in Vienna, making his first appearance as Mortimer in Schiller's *Maria Stuart*. Under Laube's careful tuition he developed within three years into an actor of the first order, excelling both in tragedy and comedy; and in 1882, after 25 years of brilliant service at the Court Theatre, he was given a patent of nobility. In 1884 he became manager-in-chief of the theatre; and in 1887–1888 acted as artistic adviser. He visited the United States in 1885, and again in 1899 and 1902, achieving great success. His chief parts were Nathan in Lessing's *Nathan der Weise*, Wallenstein, and Der Meister von Palmyra.

SONNET (Ital. *Sonetto*, dim. of *Suono*, Fr. *Sonnet*). The sonnet in the literature of modern Europe is a brief poetic form of fourteen rhymed verses, ranged according to prescription. Although in a language like the English it does no doubt require considerable ingenuity to construct a satisfactory sonnet of octave and sestet running upon four rhymes, this ingenuity is only a means to an end, the end being properly that a single wave of emotion, when emotion is either too deeply charged with thought, or too much adulterated with fancy, to pass spontaneously into the movements of pure lyric, shall be embodied in a single metrical flow and return. Whether any given sonnet be composed like that of Pier delle Vigne (of two quatrains with rhymes running a, b, a, b, a, b, a, b, and of two tercets with rhymes running, c, d, e, c, d, e), or whether the verses be arranged (on the authority of Shakespeare and Drayton) in three quatrains of alternate rhymes clinched by a couplet, or, as in the sonnet of Petrarch, in an octave of two rhymes and a sestet of either two or three rhymes—in each case the peculiar pleasure which the ear derives from the sonnet as a metrical form lies in the number and arrangement of the verses being *prescribed*, and distinctly recognizable as being prescribed. That the impulse to select for the rendering of single phases of feeling or reflection a certain recognized form is born of a natural and universal instinct is perhaps evidenced by the fact that, even when a metrical arrangement discloses no structural law demanding a prescriptive number and arrangement of verses, the poet will nevertheless, in certain moods, choose to restrict himself to a prescribed number and arrangement, as in the cases of the Italian *stornello*, the Welsh *triban*, and the beautiful rhymeless short ode of Japanese poetry. And perhaps, if we probed the matter deeply, we should find that the recognized prescription of form gives a sense of oneness that nothing else save the refrain can give to a poem which, being at once too long for a stanza in a series and too short to have the self-sustaining power of the more extended kinds of poetic art, suffers by suggesting to the ear a sense of the fragmentary and the inchoate. It is not then merely the number of the verses, it is also their arrangement as to rhymes—an arrangement leading the ear to expect a prescribed sequence and then satisfying that expectation—which entitles a form of fourteen verses to be called a sonnet.

Hence the so-called irregular sonnets of S. T. Coleridge, which lead the ear of the reader to expect the pleasure of a prescribed arrangement when what they have to offer is a pleasure of an exactly opposite kind—the pleasure of an absolute freedom from prescribed arrangement—are unsatisfactory, while (as the present writer has often pointed out) the same poet's fourteen-line poem, "Work without Hope," in which the reader expects and gets freedom from prescription, is entirely satisfactory. This same little poem of Coleridge's also affords an excellent illustration of another point in connexion with the sonnet. If we trace the history and the development of the sonnet from Pier delle Vigne to D. G. Rossetti we shall find that the poet's quest from the very first has been to write a poem in fourteen verses so arranged that they should, better than any other number and arrangement of verses, produce a certain melodic effect upon the ear, and an effect, moreover, that should bear iteration and reiteration in other poems similarly constructed. Now if we ask ourselves whether, beautiful as is this poem, "Work without Hope," taken as a single and original metrical arrangement, we should get out of a series of poems modelled line for line upon it that pleasure of iteration which we get out of a series of Petrarchan sonnets, we shall easily see why the regular sonnet of octave and sestet on the one hand, and what is called the Shakespearean sonnet on the other, have survived all other competing forms.

In modern Europe the sonnet has always had a peculiar fascination for poets of the first class—poets, that is, in whom poetic energy and plastic power are equally combined. It would seem that the very fact that the sonnet is a recognized structure suggestive of mere art—suggestive in some measure, indeed, of what Schiller would call "sport" in art—has drawn some of the most passionate poets in the world to the sonnet as the medium of their sincerest utterances. Without being coldly artificial, like the rondeau, the sestina, the *ballade*, the *villanelle*, &c., the sonnet is yet so artistic in structure, its form is so universally known, recognized, and adopted as being artistic, that the too fervid spontaneity and reality of the poet's emotion may be in a certain degree veiled, and the poet can whisper, as from behind a mask, those deepest secrets of the heart which could otherwise only find expression in purely dramatic forms.

That the sonnet was invented, not in Provence, as French critics pretend, but in Italy in the 13th century, is pretty clear, but by whom is still perhaps an open question. S. Waddington and several other critics have attributed to Fra Guittone the honour of having invented the form. But J. A. Symonds has reminded us that the sonnet beginning *Però ch' amore,* attributed to Pier delle Vigne, secretary of state in the Sicilian court of Frederick, has claims which no student of early Italian poetry can ignore.

As regards English sonnets, whether the Petrarchan and the Shakespearean are really the best of all possible forms we need not inquire. But, inasmuch as they have become so vital and so dominant over other sonnet forms that whenever we begin to read the first verse of an English sonnet we expect to find one or other of these recognized rhyme-arrangements, any departure from these two arrangements, even though the result be such a magnificent poem as Shelley's "Ozymandias," disappoints the expectation, baffles the ear, and brings with it that sense of the fragmentary and the inchoate to which we have before alluded. If, however, some writer should arise with sufficient originality of metrical endowment and sufficient poetic power to do what Keats, in a famous experiment of his, tried to do and failed—impress the public ear with a new sonnet structure, impress the public ear so powerfully that a new kind of expectance is created the moment the first verse of a sonnet is recited—then there will be three kinds of English sonnets instead of two.

With regard to the Petrarchan sonnet, all critics are perhaps now agreed that, while the form of the octave is invariable, the form of the sestet is absolutely free, save that the emotions should govern the arrangement of the verses. But as regards the division between octave and sestet, Mark Pattison says, with great boldness, but perhaps with truth, that by blending octave with sestet Milton missed the very object and end of the Petrarchan scheme. Another critic, however, Hall Caine, contends that by making "octave flow into sestet without break of music or thought" Milton consciously or unconsciously invented a new form of sonnet; that is to say, Milton, in his use of the Petrarchan octave and sestet for the embodiment of intellectual substance incapable of that partial disintegration which Petrarch himself always or mostly sought, invented a species of sonnet which is English in impetus, but Italian, or, partially Italian, in structure. Hence this critic, like William Sharp, divides all English sonnets into four groups: (1) sonnets of Shakespearean structure; (2) sonnets of octave and sestet of Miltonic structure; (3) sonnets of contemporary structure, *i.e.* all sonnets on the Petrarchan model in which the metrical and intellectual "wave of flow and ebb" (as originally formulated by the present writer in a sonnet on the sonnet, which has appeared in most of the recent anthologies) is strictly observed, and in which, while the rhyme-arrangement of the octave is invariable, that of the sestet is free; (4) sonnets of miscellaneous structure.

With regard to what is called the contemporary form—a Petrarchan arrangement with the sestet divided very sharply from the octave—the crowning difficulty and the crowning triumph of the sonnet writer has always been to so handle the rhythm of the prescribed structure as to make it seem in each individual sonnet the inevitable and natural rhythm demanded by the emotion which gives the individual sonnet birth, and this can perhaps only be achieved when the richness and apparent complexity of the rhyme-arrangement is balanced by that perfect lucidity and simplicity of syntax which is the special quest of the "sonnet of flow and ebb."

The wave theory has found acceptance with such students of the sonnet as Rossetti and Mark Pattison, J. A. Symonds, Hall Caine, and William Sharp. Symonds, indeed, seems to hint that the very name given by the Italians to the two tercets, the volta or turn, indicates the metrical meaning of the form. "The striking metaphorical symbol," says he, "drawn from the observation of the swelling and declining wave can even in some examples be applied to sonnets on the Shakespearean model; for, as a wave may fall gradually or abruptly, so the sonnet may sink with stately volume or with precipitate subsidence to its close. Rossetti furnishes incomparable examples of the former and more desirable conclusion; Sydney Dobell, in 'Home in War Time,' yields an extreme specimen of the latter."

And now as to the Shakespearean sonnet. Some very acute critics have spoken as if this form were merely a lawless succession of three quatrains clinched by a couplet, and as if the number of the quatrains might just as well have been two or four as the present prescribed number of three. If this were so, it would unquestionably be a serious impeachment of the Shakespearean sonnet, for, save in the poetry of ingenuity, no metric arrangement is otherwise than bad unless it be the result of a deep metrical necessity.

If the prescriptive arrangement of *three* quatrains clinched by a couplet is not a metrical necessity, if it is not demanded in order to prevent the couplet from losing its power, such an arrangement is idle and worse than idle; just as in the case of the Petrarchan sonnet, if it can be shown that the solid unity of the outflowing wave can be maintained as completely upon three rhymes as upon two, then the restriction of the octave to two rhymes is simple pedantry. But he who would test the metrical necessity of the arrangement in the Shakespearean sonnet has only to make the experiment of writing a poem of two quatrains with a couplet, and then another poem of four quatrains with a couplet, in order to see how inevitable is the metrical necessity of the Shakespearean number and arrangement for the achievement of the metrical effect which Shakespeare, Drayton and others sought. While in the poem of two quatrains the expected couplet has the sharp epigrammatic effect of the couplet in ordinary stanzas (such as that of *ottava rima,* and as that of the "Venus and Adonis" stanza), destroying that pensive sweetness which is the characteristic of the Shakespearean sonnet, the poem of four quatrains is just sufficiently long for the expected pleasure of the couplet to be dispersed and wasted.

The quest of the Shakespearean sonnet is not, like that of the sonnet of octave and sestet, sonority, and, so to speak, metrical counterpoint, but sweetness; and the sweetest of all possible arrangements in English versification is a succession of decasyllabic quatrains in alternate rhymes knit together and clinched by a couplet—a couplet coming not so far from the initial verse as to lose its binding power, and yet not so near the initial verse that the ring of epigram disturbs the "linked sweetness long drawn out" of this movement, but sufficiently near to shed its influence over the poem back to the initial verse. A chief part of the pleasure of the Shakespearean sonnet is the expectance of the climacteric rest of the couplet at the end (just as a chief part of the pleasure of the sonnet of octave and sestet is the expectance of the answering ebb of the sestet when the close of the octave has been reached); and this expectance is gratified too early if it comes after two quatrains, while if it comes after a greater number of quatrains than three it is dispersed and wasted altogether.

The French sonnet has a regular Petrarchan octave with a sestet of three rhymes beginning with a couplet. The Spanish sonnet is also based on the pure Italian type, and is extremely graceful and airy. The same may be said of the Portuguese sonnet—a form of which the illustrious Camoens has left nearly three hundred examples. (T. W.-D.)

SONNINO, SIDNEY, BARON (1847–), Italian statesman and financier, was born at Florence on the 11th of March 1847. Entering the diplomatic service at an early age, he was appointed successively to the legations of Madrid, Vienna, Berlin and Versailles, but in 1871 returned to Italy, to devote himself to political and social studies. On his own initiative he conducted exhaustive inquiries into the conditions of the Sicilian peasants and of the Tuscan *métayers*, and in 1877 published in co-operation with Signor Leopoldo Franchetti a masterly work on Sicily (*La Sicilia*, Florence, 1877). In 1878 he founded a weekly economic review, *La Rassegna Settimanale*, which four years later he converted into a political daily journal. Elected deputy in 1880, he distinguished himself by trenchant criticism of Magliani's finance, and upon the fall of Magliani was for some months, in 1889, under-secretary of state for the treasury. In view of the severe monetary crisis of 1893 he was entrusted by Crispi with the portfolio of finance (December 1893), and in spite of determined opposition dealt energetically and successfully with the deficit of more than £6,000,000 then existing in the exchequer. By abolishing the illusory pensions fund, by applying and amending the Bank Laws, effecting economies, and increasing taxation upon corn, incomes from consolidated stock, salt and matches, he averted national bankruptcy, and placed Italian finance upon a sounder basis than at any time since the fall of the Right. Though averse from the policy of unlimited colonial expansion, he provided by a loan for the cost of the Abyssinian War in which the tactics of General Baratieri had involved the Crispi cabinet, but fell with Crispi after the disaster at Adowa (March 1896). Assuming then the leadership of the constitutional opposition, he combated the alliance between the Di Rudini cabinet and the subversive parties, criticized the financial schemes of the treasury minister, Luzzatti, and opposed the "democratic" finance of the first Pelloux administration as likely to endanger financial stability. After the modification of the Pelloux cabinet (May 1899) he became leader of the ministerial majority, and bore the brunt of the struggle against Socialist obstruction in connexion with the Public Safety Bill. Upon the formation of the Zanardelli cabinet (Feb. 1901) he once more became leader of the constitutional opposition, and in the autumn of the year founded a daily organ, *Il Giornale d'Italia*, the better to propagate moderate Liberal ideas. Although highly esteemed for his integrity and genuine ability, it was not until February 1906 that he was called upon to form a ministry, on the fall of the Fortis cabinet. He immediately set about introducing certain urgent reforms, suppressed all subsidies to the press, and declared his intention of governing according to law and justice. In May, however, an adverse vote of the Chamber on a purely technical matter led to his resignation.

SONORA, a northern state of Mexico, bounded N. by the United States, E. by Chihuahua, S. by Sinaloa and W. by the Gulf of California. It is the second largest state in the republic, having an area of 76,900 sq. m. Pop. (1900), 221,682, a large part being Indian. The surface of the state is much broken by the Sierra Madre Occidental, which extends through it from north to south and covers its entire width with parallel ranges, enclosing fertile valleys. Four important rivers traverse the state from east to west with courses of 145 to 390 m. and discharge into the Gulf of California, viz.: the Altar, or Asunción, Sonora, Yaqui and Mayo. The longest is the Yaqui, which has its source on the eastern side of the Sierra Tarahumare in Chihuahua and breaks through several ranges of the Sierra Madre before reaching the gulf near Guaymas. The smaller tributaries of these rivers of Sonora are often only dry canyons in the dry season. Agriculture has been developed only to a limited extent in Sonora, because of its aridity, lack of irrigation facilities, lack of railways and roads, and the unsettled state of the country. The soil of the sierra valleys is fertile, and when it is irrigated forage and cereal crops may be grown in abundance. Sugar-cane, tobacco, maguey, cotton, in small quantities, and fruits are also produced. There are excellent pasture lands, especially in the upland districts, and stock-raising is an important and profitable industry. Land is held in large estates, some of them upwards of 100 sq. m. in area. The mineral resources include silver, gold, copper, lead, tin, iron and coal, and mining is the chief industry. The lack of transportation facilities has been partly relieved by the construction of a branch of the Southern Pacific (American) from Nogales southward to Guaymas and the Sinaloa frontier, from which it has been extended to Mazatlán. Guaymas is the only port of importance on the coast, but it has a large trade and is visited by the steamers of several lines. The capital of the state (since 1882) is Hermosillo (pop. 1900, 17,618), on the Sonora river, 110 m. north of Guaymas, with which it is connected by rail. It suffered much in 1865–1866 from the savage struggle between Imperialists and Republicans, and in subsequent partisan warfare. Other important towns are Alamos (pop. 1895, 6197), 132 m. E.S.E. of Guaymas, Moctezuma, 90 m. north of Hermosillo, and Ures, the old capital of Sonora and seat of a bishopric, 33 m. north-east of Hermosillo.

The first Jesuit mission in Sonora, founded among the Mayos in 1613, seems to have been the first permanent settlement in the state, although Coronado passed through it and its coast had been visited by early navigators. The hostility of certain tribes prevented its rapid settlement. Ures was founded in 1636, and Arizpe in 1648. Near the end of the century Sonora and Sinaloa were divided into two districts, in 1767 the Jesuit missions were secularized, in 1779 the government of the province was definitely organized by Caballero de Croix, and in 1783 Arizpe became the provincial capital. The bishopric of Sonora was created in 1781 with Arizpe as its seat. Up to this time the history of the province is little else than a record of savage warfare with the Apaches, Seris, Yaquis and other tribes. The development of rich gold and silver mines brought in more Spanish settlers, and then the record changes to one of partisan warfare, which continued down to the administration of President Porfirio Diaz.

SONPUR, a feudatory state of India, in the Orissa division of Bengal, to which it was transferred from the Central Provinces in 1905. Area, 906 sq. m. Pop. (1901), 169,877, showing a decrease of 13% in the decade, due to the results of famine. Estimated revenue £8000, tribute £600. The chief is a Rajput of the Patna line. Rice and timber are exported, and iron ore is said to abound. The town of Sonpur is on the Mahanadi river just above the point where it enters Orissa. Pop. (1901), 8887.

SONSONATE, the capital of the department of Sonsonate, Salvador; on the river Sensunapan and the railway from San Salvador to the Pacific port of Acajutla, 13 m. south. Pop. (1905), about 17,000. Sonsonate is the centre of a rich agricultural district, and one of the busiest manufacturing towns in the republic. It produces cotton cloth, pottery, mats and baskets, boots and shoes, sugar, starch, cigars and spirits. Through Acajutla it exports coffee and sugar, and imports grain for distribution to all parts of the interior.

SOOT (O. Eng. *sot*, cf. Icel. *sot*, Dan. *sod*; possibly from root *sed*, to sit), the black substance produced in the process of the combustion of fuel and deposited in finely granulated particles on the interior of chimneys or pipes through which the smoke passes. Soot is a natural nitrogenous manure (*q.v.*), and its value depends on the ammonia salts contained in it.

SOPHIA (1630–1714), electress of Hanover, twelfth child of Frederick V., elector palatine of the Rhine, by his wife Elizabeth, a daughter of the English king James I., was born at the Hague on the 14th of October 1630. Residing after 1649 at Heidelberg with her brother, the restored elector palatine, Charles Louis, she was betrothed to George William afterwards duke of Lüneburg-Celle; but in 1658 she married his younger brother, Ernest Augustus, who became elector of Brunswick-Lüneburg, or Hanover, in 1692. Her married life was not a happy one. Her husband was unfaithful; three of her six sons fell in battle; and other family troubles included an abiding hostility between her and Sophia Dorothea, the wife of her eldest son, George Louis. Sophia became a widow in 1698, but before then her name had been mentioned in connexion with the English throne. When considering the Bill of Rights in 1689 the House of Commons refused to place her in the succession, and the matter rested until 1700 when the state of affairs in England was more serious. William III. was ill and childless; William, duke of Gloucester, the only surviving child of the princess Anne, had just died. The strong Protestant feeling in the country, the danger from the Stuarts, and the hostility of France, made it imperative to exclude all Roman Catholics from the throne; and the electress was the nearest heir who was a Protestant. Accordingly by the Act of Settlement of 1701 the English Crown, in default of issue from either William or Anne, was settled upon "the most excellent princess Sophia, electress and duchess-dowager of Hanover" and "the heirs of her body, being Protestant." Sophia watched affairs in England during the reign of Anne with great interest, although her son, the elector George Louis, objected to any interference in that country, and Anne disliked all mention of her successor. An angry letter from Anne possibly hastened Sophia's death, which took place at Herrenhausen on the 8th of June 1714; less than two months later her son, George Louis, became king of Great Britain and Ireland as George I. on the death of Anne. Sophia, who corresponded with Leibnitz, was a strong woman both mentally and physically, and possessed wide and cultured tastes.

Rait, *Five Stuart Princesses* (London, 1902).

SOPHIA ALEKSYEEVNA (1657–1704), tsarevna and regent of Russia, was the third daughter of Tsar Alexius and Maria Miloslavskaya. Educated on semi-ecclesiastical lines by the learned monk of Kiev, Polotsky, she emancipated herself betimes from the traditional tyranny of the *terem*, or women's quarters. Setting aside court etiquette, she had nursed her brother Tsar Theodore III. in his last illness, and publicly appeared at his obsequies, though it was usual only for the widow of the deceased and his successor to the throne to attend that ceremony. Three days after little Peter, then in his fourth year, had been raised to the throne, she won over the *stryeltsy*, or musketeers, who at her instigation burst into the Kreml, murdering everyone they met, including Artamon Matvyeev, Peter's chief supporter, and Ivan Naruishkin, the brother of the tsaritsa-regent Natalia, Peter's mother (May 15–17, 1682). When the rebellion was over there was found to be no government. Everyone was panic-stricken and in hiding except Sophia, and to her, as the only visible representative of authority, the court naturally turned for orders. She took it upon herself to pay off and pacify the *stryeltsy*, and secretly worked upon them to present (May 29) a petition to the council of state to the effect that her half-brother Ivan should be declared senior tsar, while Peter was degraded into the junior tsar. As Ivan was hopelessly infirm and half idiotic, it is plain that the absurd duumvirate was but a stepping-stone to the ambition of Sophia, who thus became the actual ruler of Russia. The *stryeltsy* were not only pardoned for their atrocities, but petted. A general amnesty in the most absolute terms was granted to them, and at their special request a triumphal column was erected in the Red Square of the Kreml, to commemorate their cowardly massacre of the partisans of Peter. When, however, instigated by their leader Prince Ivan Khovansky, who is suspected to have been aiming at the throne himself, and supported by the reactionary elements of the population, conspicuous among whom were the *raskolniks* or dissenters, they proceeded on the 5th of July to the great reception-hall of the palace in the Kreml to present a petition against all novelties, Sophia boldly faced them. Supported by her aunts and the patriarch, and secretly assured of the support of the orthodox half of the *stryeltsy*, she forbade all discussion and browbeat the rebels into submission. A later attempt on the part of Khovansky to overthrow her was anticipated and severely punished. By the 6th of November Sophia's triumph was complete. The conduct of foreign affairs she committed entirely to her paramour, Prince Vasily Golitsuin, while the crafty and experienced clerk of the council, Theodore Shaklovity, looked after domestic affairs and the treasury. Sophia's fondness for Golitsuin induced her to magnify his barely successful campaigns in the Crimea into brilliant triumphs which she richly rewarded, thus disgusting everyone who had the honour of the nation at heart. Most of the malcontents rested their hopes for the future on the young tsar Peter, who was the first to benefit by his sister's growing unpopularity. Sophia was shrewd enough to recognize that her position was becoming very insecure. When Peter reached man's estate she would only be in the way, and she was not the sort of woman who is easily thrust aside. She had crowned her little brothers in order that she might reign in their names. She had added her name to theirs in state documents, boldly subscribing herself "Sovereign Princess of all Russia." She had officially informed the doge of Venice that she was the co-regent of the tsars. And now the terrible term of her usurped authority was approaching. In her extremity she took council of Shaklovity, and it was agreed (1687) between them that the *stryeltsy* should be employed to dethrone Peter. The *stryeltsy*, however, received the whole project so coldly that it had to be abandoned. A second conspiracy to seize him in his bed (August 1689) was betrayed to Peter, and he fled to the fortress-monastery of Troitsa. Here all his friends rallied round him, including the bulk of the magnates, half the *stryeltsy*, and all the foreign mercenaries. From the 12th of August to the 7th of September Sophia endeavoured to set up a rival camp in the Kreml; but all her professed adherents gradually stole away from her. She was compelled to retire within the Novo-Dyeyichy monastery, but without taking the veil. Nine years later (1698), on suspicion of being concerned in the rebellion of the *stryeltsy*, she was shorn a nun and imprisoned for life under military supervision. As " Sister Susannah " she disappeared from history. Russian historians are still divided in their opinion concerning this extraordinary woman. While some of them paint her in the darkest colours as an unprincipled adventuress, the representative of a new Byzantinism, others simply regard her as the victim of circumstances. Others, more indulgent still, acquit her of all blame; and a few, impressed by her indisputable energy and ability, evade a decision altogether by simply describing her as a prodigy.

See J. E. Zabyelin, *Domestic Conditions of the Russian Princes* (Rus.; Moscow, 1895); N. G. Ustryalov, *History of the Reign of Peter the Great* (Rus.; Petersburg, 1858); N. Y. Aristov, *The Moscow Rebellions during the Regency of Sophia* (Rus.; Warsaw, 1871); R. N. Bain, *The First Romanovs* (London, 1905). (R. N. B.)

SOPHIA DOROTHEA (1666–1726), wife of George Louis, elector of Hanover (George I. of England), only child of George William, duke of Brunswick-Lüneburg-Celle, by a Huguenot lady named Eleanore d'Olbreuze (1639–1722), was born on the 15th of September 1666. George William had undertaken to remain unmarried, but his desire to improve the status of his mistress (whom in spite of his promise he married in 1676) and of his daughter greatly alarmed his relatives, as these proceedings threatened to hinder the contemplated union of the Lüneburg territories. However, in 1682, this difficulty was bridged over by the marriage of Sophia Dorothea with her cousin George Louis, son of Duke Ernest Augustus, who became elector of Hanover in 1692. This union was a very unhappy one. The relatives of George Louis, especially his mother, the electress Sophia, hated and despised his wife, and this feeling was soon shared by the prince himself. It was under these circumstances that Sophia Dorothea made the acquaintance of Count Philipp Christoph von Königsmark (*q.v.*), with whom her name is inseparably associated. Königsmark assisted her in one or two futile attempts to escape from Hanover, and rightly or wrongly was regarded as her lover. In 1694 the count was assassinated, and the princess was divorced and imprisoned at Ahlden, remaining in captivity until her death on the 23rd of November 1726. Sophia Dorothea is sometimes referred to as the " princess of Ahlden." Her two children were the English king, George II., and Sophia Dorothea, wife of Frederick William I. of Prussia, and mother of Frederick the Great. Sophia's infidelity to her husband is not absolutely proved, as it is probable that the letters which purport to have passed between Königsmark and herself are forgeries.

Greenwood, *Lives of the Hanoverian Queens of England* (1909), vol. i.

SOPHISTS (from Gr. σοφιστής, literally, man of wisdom), the name given by the Greeks about the middle of the 5th century B.C. to certain teachers of a superior grade who, distinguishing themselves from philosophers on the one hand and from artists and craftsmen on the other, claimed to prepare their pupils, not for any particular study or profession, but for civic life. For nearly a hundred years the sophists held almost a monopoly of general or liberal education. Yet, within the limits of the profession, there was considerable diversity both of theory and of practice. Four principal varieties are distinguishable, and may be described as the sophistries of culture, of rhetoric, of politics, and of " eristic," *i.e.* disputation. Each of these predominated in its turn, though not to the exclusion of others, the sophistry of culture beginning about 447, and leading to the sophistry of eristic, and the sophistry of rhetoric taking root in central Greece about 427, and merging in the sophistry of politics. Further, since Socrates and the Socratics were educators, they too might be, and in general were, regarded as sophists; but, as they conceived truth—so far as it was attainable—rather than success in life, in the law court, in the assembly, or in debate, to be the right end of intellectual effort, they were at variance with their rivals, and are commonly ranked by historians, not with the sophists, who confessedly despaired of knowledge, but with the philosophers, who, however unavailingly, continued to seek it. With the establishment of the great philosophical schools—first, of the Academy, next of the Lyceum—the philosophers took the place of the sophists as the educators of Greece.

The sophistical movement was then, primarily, an attempt to provide a general or liberal education which should supplement the customary instruction in reading, writing, gymnastic and music. But, as the sophists of the first period chose for their instruments grammar, style, literature and oratory, while those of the second and third developments were professed rhetoricians, sophistry exercised an important influence upon literature. Then again, as the movement, taking its rise in the philosophical agnosticism which grew out of the early physical systems, was itself persistently sceptical, sophistry may be regarded as an interlude in the history of philosophy. Finally, the practice of rhetoric and eristic, which presently became prominent in sophistical teaching, had, or at any rate seemed to have, a mischievous effect upon conduct; and the charge of seeking, whether in exposition or in debate, not truth but victory—which charge was impressively urged against the sophists by Plato—grew into an accusation of holding and teaching immoral and unsocial doctrines, and in our own day has been the subject of eager controversy.

1. *Genesis and Development of Sophistry.*—Sophistry arose out of a crisis in philosophy. The earlier Ionian physicists, Thales, Anaximander and Anaximenes, in their attempts to trace the Multiplicity of things to a single material element, had been troubled by no misgivings about the possibility of knowledge. But, when Heraclitus to the assumption of fire as the single material cause added the doctrine that all things are in perpetual flux, he found himself obliged to admit that things cannot be known. Thus, though, in so far as he asserted his fundamental doctrine without doubt or qualification, he was a dogmatist, in all else he was a sceptic. Again, the Eleatic Parmenides, deriving from the theologian Xenophanes the distinction between ἐπιστήμη and δόξα, conceived that, whilst the One exists and is the object of knowledge, the Multiplicity of things becomes and is the object of opinion; but, when his successor Zeno provided the system with a logic, the consistent application of that logic resolved the fundamental doctrine into the single proposition " One is One," or, more exactly, into the single identity " One One." Thus Eleaticism, though professedly dogmatic, was inconsistent in its theory of the One and its attributes, and openly sceptical in regard to the world of nature. Lastly, the philosophers of the second physical succession —Empedocles, Anaxagoras, Leucippus—not directly attacking the great mystery of the One and the Many, but in virtue of a scientific instinct approaching it through the investigation of phenomena, were brought by their study of sensation to perceive and to proclaim the inadequacy of the organs of sense. Thus they too, despite their air of dogmatism, were in effect sceptics. In short, from different standpoints, the three philosophical successions had devised systems which were in reality sceptical, though they had none of them recognized the sceptical inference.

Towards the middle of the 5th century, however, Protagoras of Abdera, taking account of the teaching of the first, and possibly of the second, of the physical successions, and Gorgias of Leontini, starting from the teaching of the metaphysical succession of Elea, drew that sceptical inference from which the philosophers had shrunk. If, argued Protagoras in a treatise entitled *Truth*, all things are in flux, so that sensation is subjective, it follows that " Man is the measure of all things, of what is, that it is, and of what is not, that it is not "; in other words, there is no such thing as objective truth. Similarly, Gorgias, in a work *On Nature, or on the Nonent*, maintained (*a*) that nothing is, (*b*) that, if anything is, it cannot be known, (*c*) that, if anything is and can be known, it cannot be expressed in speech; and the summaries which have been preserved by Sextus Empiricus (*Adv. Math.* vii. 65–87) and by the author of the *De Melisso*, &c. (chs. 5, 6), show that, in defending these propositions, Gorgias availed himself of the arguments which Zeno had used to discredit the popular belief in the existence of the Many; in other words, that Gorgias turned the destructive logic of Zeno against the constructive ontology of Parmenides, thereby not only reducing Eleaticism to nothingness, but also, until such time as a better logic than that of Zeno should be provided, precluding all philosophical inquiry whatsoever. Thus, whereas the representatives of the three successions had continued to regard themselves as philosophers or seekers after truth, Protagoras and Gorgias, plainly acknowledging their defeat, withdrew from the ungrateful struggle.

Meagre as were the results which the earlier thinkers had obtained, the extinction of philosophy just at the time when the liberal arts became more technical and consequently less available as employments of leisure, threatened to leave a blank in Hellenic life. Accordingly Protagoras, while with the one hand he put away philosophy, with the other offered a substitute. Emphasizing the function of the teacher, which with the philosophers had been subordinate, and proclaiming the right end of intellectual endeavour to be, not "truth" (ἀλήθεια) or "wisdom" (σοφία), which was unattainable, but "virtue" or "excellence" (ἀρετή), he sought to communicate, not a theory of the universe, but an aptitude for civic life. "The lesson which I have to teach," Plato makes him say (*Prot.* 318 E), "is prudence or good counsel, both in respect of domestic matters that the man may manage his household aright, and in respect of public affairs, that he may be thoroughly qualified to take part, both by deed and by word, in the business of the state. In other words, I profess to make men good citizens." As instruments of education Protagoras used grammar, style, poetry and oratory. Thus, whereas hitherto the young Greek, having completed his elementary training in the schools of the γραμματιστής, the κιθαριστής, and the παιδοτρίβης, was left to prepare himself for his life's work as best he might, by philosophical speculation, by artistic practice, or otherwise, one who passed from the elementary schools to the lecture-room of Protagoras received from him a "higher education." The programme was exclusively literary, but for the moment it enabled Protagoras to satisfy the demand which he had discovered and evoked. Wherever he went, his lecture-room was crowded with admiring pupils, whose homage filled his purse and enhanced his reputation.

After Protagoras the most prominent of the literary sophists was Prodicus of Ceos. Establishing himself at Athens, he taught "virtue" or "excellence," in the sense attached to the word by Protagoras, partly by means of literary subjects, partly in discourses upon practical ethics. It is plain that Prodicus was an affected pedant; yet his simple conventional morality found favour, and Plato (*Rep.* 600 C) couples him with Protagoras in his testimony to the popularity of the sophists and their teaching.

At Athens, the centre of the intellectual life of Greece, there was soon to be found a host of sophists; some of them strangers, others citizens; some of them bred under Protagoras and Prodicus, others self-taught. In the teaching of the sophists of this younger generation two points are observable. First, their independence of philosophy and the arts being assured, though they continued to regard "civic excellence" as their aim, it was no longer necessary for them to make the assertion of its claims a principal element in their exposition. Secondly, for the sake of novelty they extended their range, including scientific and technical subjects, but handling them, and teaching their pupils to handle them, in a popular way. In this stage of sophistry then, the sophist, though not a specialist, trenched upon the provinces of specialists; and accordingly Plato (*Prot.* 318 E) makes Protagoras pointedly refer to sophists who, "when young men have made their escape from the arts, plunge them once more into technical study, and teach them such subjects as arithmetic, astronomy, geometry and music." The sophist of whom the Platonic Protagoras is here thinking was Hippias of Elis, who gave popular lectures, not only upon the four subjects just mentioned, but also upon grammar, mythology, family history, archaeology, Homerology and the education of youth. In this polymath we see at once the degradation of the sophistry of culture and the link which connects Protagoras and Prodicus with the eristics, who at a later period taught, not, like Hippias, all branches of learning, but a universally applicable method of disputation.

Meanwhile, Gorgias of Leontini, who, as has been seen, had studied and rejected the philosophy of western Greece, gave to sophistry a new direction by bringing to the mother country the technical study of rhetoric—especially forensic rhetoric (Plato, *Gorg.* 454 B; cf. Aristotle, *Rhet.* 1354, b 26)—which study had begun in Sicily with Corax and Tisias nearly forty years before. Gorgias was already advanced in years and rich in honours when, in 427, he visited Athens as the head of an embassy sent to solicit aid against Syracuse. Received with acclamation, he spent the rest of his long life in central Greece, winning applause by the display of his oratorical gifts and acquiring wealth by the teaching of rhetoric. There is no evidence to show that at any period of his life he called himself a sophist; and, as Plato (*Gorg.* 449 A) makes him describe himself as a ῥήτωρ, it is reasonable to suppose that he preferred that title. That he should do so was only natural, since his position as a teacher of rhetoric was already secure when Protagoras made his first appearance in the character of a sophist; and, as Protagoras, Prodicus and the rest of the sophists of culture offered a comprehensive education, of which oratory formed only a part, whilst Gorgias made no pretence of teaching "civic excellence" (Plato, *Meno*, 95 C), and found a substitute for philosophy, not in literature generally, but in the professional study of rhetoric alone, it would have been convenient if the distinction between sophistry and rhetoric had been maintained. But though, as will be seen hereafter, these two sorts of education were sometimes distinguished, Gorgias and those who succeeded him as teachers of rhetoric, such as Thrasymachus of Chalcedon and Polus of Agrigentum, were commonly called by the title which Protagoras had assumed and brought into familiar use.

Rhetorical sophistry, as taught by Gorgias with special reference to the requirements of the law courts, led by an easy transition to political sophistry. During the century which had elapsed since the expulsion of the Peisistratids and the establishment of the democracy, the Athenian constitution had developed with a rapidity which produced an oligarchical reaction, and the discussion of constitutional principles and precedents, always familiar to the citizen of Athens, was thus abnormally stimulated. The Peloponnesian War, too, not only added a deeper interest to ordinary questions of policy, but also caused the relations of dissentient parties, of allied and belligerent states, of citizens and aliens, of bond and free, of Greeks and barbarians, to be eagerly debated in the light of present experience. It was only natural then that some of those who professed to prepare young Athenians for public life should give to their teaching a distinctively political direction; and accordingly we find Isocrates recognizing teachers of politics, and discriminating them at once from those earlier sophists who gave popular instruction in the arts and from the contemporary eristics. To this class, that of the political sophists, may be assigned Lycophron, Alcidamas and Isocrates himself. For, though that celebrated personage would have liked to be called, not "sophist" but "political philosopher," and tried to fasten the name of "sophist" upon his opponents the Socratics, it is clear from his own statement that he was commonly ranked with the sophists, and that he had no claim, except on the score of superior popularity and success, to be dissociated from the other teachers of political rhetoric. It is true that he was not a political sophist of the vulgar type, that as a theorist he was honest and patriotic, and that, in addition to his fame as a teacher, he had a distinct reputation as a man of letters; but he was a professor of political rhetoric, and, as such, in the phraseology of the day, a sophist. He had already reached the height of his fame when Plato opened a rival school at the Academy, and pointedly attacked him in the *Gorgias*, the *Phaedrus* and the *Republic*. Thenceforward, there was a perpetual controversy between the rhetorician and the philosopher, and the struggle of educational systems continued until, in the next generation, the philosophers were left in possession of the field.

While the sophistry of rhetoric led to the sophistry of politics, the sophistry of culture led to the sophistry of disputation. It has been seen that the range of subjects recognized by Protagoras and Prodicus gradually extended itself, until Hippias professed himself a teacher of all branches of learning, including in his list subjects taught by artists and professional men, but handling them from a popular or non-professional point of view. The successors of the polymath claimed to possess and to communicate, not the knowledge of all branches of learning, but an aptitude for dealing with all subjects, which aptitude should make the knowledge of any subject superfluous. In other words, they cultivated skill in disputation. Now skill in disputation is plainly a valuable accomplishment; and, as the Aristotelian logic grew out of the regulated discussions of the eristics and their pupils, the disputant sophistry of the 4th century deserves more attention and more respect than it usually receives from historians of Greek thought. But when men set themselves to cultivate skill in disputation, regarding the matter discussed not as a serious issue, but as a thesis upon which to practise their powers of controversy, they learn to pursue, not truth, but victory; and, their criterion of excellence having been thus perverted, they presently prefer ingenious fallacy to solid reasoning and the applause of bystanders to the consciousness of honest effort. Indeed, the sophists generally had a special predisposition to error of this sort, not only because sophistry was from the beginning a substitute for the pursuit of truth, but also because the successful professor, travelling from city to city, or settling abroad, could take no part in public affairs, and thus was not at every step reminded of the importance of the "material" element of exposition and reasoning. Paradox, however, soon becomes stale, and fallacy wearisome. Hence, despite its original popularity, eristical sophistry could not hold its ground. The man of the world who had cultivated it in his youth regarded it in riper years as a foolish pedantry, or at best as a propaedeutic exercise; while the serious student, necessarily preferring that form of disputation which recognized truth as the end of this, as of other intellectual processes, betook himself to one or other of the philosophies of the revival.

In order to complete this sketch of the development of sophistry in the latter half of the 5th century and the earlier half of the 4th, it is necessary next to take account of Socrates and the Socratics. A foe to philosophy and a renegade from art, Socrates took his departure from the same point as Protagoras, and moved in the same direction, that of the education of youth. Finding in the cultivation of "virtue" or "excellence" a substitute for the pursuit of scientific truth, and in disputation the sole means by which "virtue" or "excellence" could be attained, he resembled at once the sophists of culture and the sophists of eristic. But, inasmuch as the "virtue" or "excellence" which he sought was that of the man rather than that of the official, while the disputation which he practised had for its aim, not victory, but the elimination of error, the differences which separated him from the sophists of culture and the sophists of eristic were only less considerable than the resemblances which he bore to both; and further, though his whole time and attention were bestowed upon the education of young Athenians, his theory of the relations of teacher and pupil differed from that of the recognized professors of education, inasmuch as the taking of fees seemed to him to entail a base surrender of the teacher's independence. The principal characteristics of Socrates's theory of education were accepted, *mutatis mutandis*, by the leading Socratics. With these resemblances to the contemporary professors of education, and with these differences, were Socrates and the Socratics sophists or not? To this question there is no simple answer, yes or no. It is certain that Socrates's contemporaries regarded him as a sophist; and it was only reasonable that they should so regard him, because in opposition to the physicists of the past and the artists of the present he asserted the claims of higher education. But, though according to the phraseology of the time he was a sophist, he was not a typical sophist—his principle that, while scientific truth is unattainable by man, right opinion is the only basis of right action, clearly differentiating him from all the other professors of "virtue." Again, as the Socratics—Plato himself, when he established himself at the Academy, being no exception—were, like their master, educators rather than philosophers, and in their teaching laid especial stress upon discussion, they, too, were doubtless regarded as sophists, not by Isocrates only, but by their contemporaries in general; and it may be conjectured that the disputatious tendencies of the Megarian school made it all the more difficult for Plato and others to secure a proper appreciation of the difference between dialectic, or discussion with a view to the discovery of truth, and eristic, or discussion with a view to victory. Changing circumstances, however, carry with them changes in the meaning and application of words. Whereas, so long as philosophy was in abeyance Socrates and the Socratics were regarded as sophists of an abnormal sort, as soon as philosophy revived it was dimly perceived that, in so far as Socrates and the Socratics dissented from sophistry, they preserved the philosophical tradition. This being so, it was found convenient to revise the terminology of the past, and to include in the philosophical succession those who, though not philosophers, had cherished the sacred spark. As for Socrates, he ranked himself neither with the philosophers, who professed to know, nor with the sophists, who professed to teach; and, if he sometimes described himself as a φιλόσοφcs he was careful to indicate that he pretended to no other knowledge than that of his own limitations.

It would seem then, (1) that popular nomenclature included under the term "sophist" all teachers—whether professors, or like Socrates, amateurs—who communicated, not artistic skill, nor philosophical theory, but a general or liberal education; (2) that, of those who were commonly accounted sophists, some professed culture, some forensic rhetoric, some political rhetoric, some eristic, some (*i.e.* the Socratics) dialectic; (3) that the differences between the different groups of sophists were not inconsiderable, and that in particular the teaching of the rhetoricians was distinct in origin, and, in so far as its aim was success in a special walk of life, distinct in character, from the more general teaching of the sophists of culture, the eristics, and the dialecticians, while the teaching of the dialecticians was discriminated from that of the rest, in so far as the aim of the dialecticians was truth, or at least the bettering of opinion; and, consequently, (4) that, in awarding praise and blame to sophistry and its representatives, the distinctive characteristics of the groups above enumerated must be studiously kept in view.

Lapse of time and change of circumstances brought with them not merely changes in the subjects taught, but also changes in the popular estimate of sophistry and sophists. The first and most obvious sentiment which sophistry evoked was an enthusiastic and admiring interest. The sophist seemed to his youthful hearers to open a new field of intellectual activity and thereby to add a fresh zest to existence. But in proportion to the fascination which he exercised upon the young was the distrust which he inspired in their less pliable elders. Not only were they dismayed by the novelty of the sophistical teaching, but also they vaguely perceived that it was subversive of authority, of the authority of the parent over the child as well as of the authority of the state over the citizen. Of the two conflicting sentiments, the favour of the young, gaining as years passed away, naturally prevailed; sophistry ceased to be novel, and attendance in the lecture-rooms of the sophists came to be thought not less necessary for the youth than attendance in the elementary schools for the boy. The lively enthusiasm and the furious opposition which greeted Protagoras had now burnt themselves out, and before long the sophist was treated by the man of the world as a harmless, necessary pedagogue.

That sophistry must be studied in its historical development was clearly seen by Plato, whose dialogue called the *Sophist* contains a formal review of the changing phases and aspects of sophistical teaching. The subject which is discussed in that dialogue and its successor, the *Statesman*, being the question "Are sophist, statesman, and philosopher identical or different?" the Eleate who acts as protagonist seeks a definition of the term "sophist" by means of a series of divisions or dichotomies. In this way he is led to regard the sophist successively—(1) as a practitioner of that branch of mercenary persuasion in private which professes to impart "virtue" and exacts payment in the shape of a fee, in opposition to the flatterer who offers pleasure, asking for sustenance in return; (2) as a practitioner of that branch of mental trading which purveys from city to city discourses and lessons about "virtue," in opposition to the artist who similarly purveys discourses and lessons about the arts; (3) and (4) as a practitioner of those branches of mental trading, retail and wholesale, which purvey discourses and lessons about "virtue" within a city, in opposition to the artists who similarly purvey discourses and lessons about the arts; (5) as a practitioner of that branch of eristic which brings to the professor pecuniary emolument, eristic being the systematic form of antilogic, and dealing with justice, injustice and other abstractions, and antilogic being that form of disputation which uses question and answer in private, in opposition to forensic, which uses continuous discourse in the law-courts; (6) as a practitioner of that branch of education which purges away the vain conceit of wisdom by means of cross-examination, in opposition to the traditional method of reproof or admonition. These definitions being thus various, the Eleate notes that the sophist, in consideration of a fee, disputes, and teaches others to dispute, about things divine, cosmical, metaphysical, legal, political, technical—in fact, about everything—not having knowledge of them, because universal knowledge is unattainable; after which he is in a position to define the sophist (7) as a conscious impostor who, in private, by discontinuous discourse, compels his interlocutor to contradict himself, in opposition to the δημολογικός, who, in public, by continuous discourse, imposes upon crowds.

It is clear that the final definition is preferred, not because of any intrinsic superiority, but because it has a direct bearing upon the question "Are sophist, statesman and philosopher identical or different?" and that the various definitions represent different stages or forms of sophistry as conceived from different points of view. Thus the first and second definitions represent the founders of the sophistry of culture, Protagoras and Prodicus, from the respective points of view of the older Athenians, who disliked the new culture, and the younger Athenians, who admired it; the third and fourth definitions represent imitators to whom the note of itinerancy was not applicable; the fifth definition represents the earlier eristics, contemporaries of Socrates, whom it was necessary to distinguish from the teachers of forensic oratory; the sixth is framed to meet the anomalous case of Socrates, in whom many saw the typical sophist, though Plato conceives this view to be unfortunate; and the seventh and final definition, having in view eristical sophistry fully developed, distinguishes it from δημολογική, *i.e.* political rhetoric, but at the same time hints that, though σοφιστική and δημολογική may be discriminated, they are nevertheless near akin, the one being the ape of philosophy, the other the ape of statesmanship. In short, Plato traces the changes which, in less than a century, had taken place in the meaning of the term, partly through changes in the practice of the sophists, partly through changes in their surroundings and in public opinion, so as to show by a familiar instance that general terms which do not describe natural kinds cannot have a stable connotation.

Now it is easy to see that in this careful statement Plato recognizes three periods. The first four definitions represent the period of Protagoras, Prodicus, and their immediate successors, when the object sought was "virtue," "excellence," "culture," and the means to it was literature. The fifth and sixth definitions represent the close of the 5th century, when sophistry handled eristically, and perhaps, though Plato demurs to the inclusion, dialectically, questions of justice, injustice and the like, δικανική or forensic rhetoric being its proximate rival. The seventh definition represents the first half of the 4th century, when sophistry was eristical in a wider field, having for its rival, not forensic rhetoric, but the rhetoric of the assembly. Plato's classification of educational theories is then substantially the classification adopted in this article, though, whereas here, in accordance with well-attested popular usage, all the educational theories mentioned are included under the head of sophistry, Plato allows to rhetoric, forensic and political, an independent position, and hints that there are grounds for denying the title of sophist to the dialectician Socrates. Incidentally we gather two important facts—(1) that contemporary with the dialectic of Socrates there was an eristic, and (2) that this eristic was mainly applied to ethical questions. Finally, we may be sure that, if Plato was thus careful to distinguish the phases and aspects of sophistical development, he could never have fallen into the modern error of bestowing upon those whom the Greeks called sophists either indiscriminate censure or indiscriminate laudation.

2. *Relations of Sophistry to Education, Literature and Philosophy*.—If then the sophists, from Protagoras to Isocrates, were before everything educators, it becomes necessary to inquire whether their labours marked or promoted an advance in educational theory and method. At the beginning of the 5th century B.C. every young Greek of the better sort already received rudimentary instruction, not only in music and gymnastics, but also in reading and writing. Further, in the colonies, and especially the colonies of the West, philosophy and art had done something for higher education. Thus in Italy the Pythagorean school was, in the fullest sense of the term, an educational institution; and in Sicily the rhetorical teaching of Corax and Tisias was presumably educational in the same sense as the teaching of Gorgias. But in central Greece, where, at any rate down to the Persian Wars, politics, domestic and foreign, were all-engrossing, and left the citizen little leisure for self-cultivation, the need of a higher education had hardly made itself felt. The overthrow of the Persian invaders changed all this. Henceforward the best of Greek art, philosophy, and literature gravitated to Athens, and with their concentration and consequent development came a general and growing demand for teaching. As has been seen, it was just at this period that philosophy and art ceased to be available for educational purposes, and accordingly the literary sophists were popular precisely because they offered advanced teaching which was neither philosophical nor artistic. Their recognition of the demand and their attempt to satisfy it are no small claims to distinction. That, whereas before the time of Protagoras there was little higher education in the colonies and less in central Greece, after his time attendance in the lecture-rooms of the sophists was the customary sequel to attendance in the elementary schools, is a fact which speaks for itself.

But this is not all. The education provided by the sophists of culture had positive merits. When Protagoras included in his course grammar, style, interpretation of the poets, and oratory, supplementing his own continuous expositions by disputations in which he and his pupils took part, he showed a not inadequate appreciation of the requisites of a literary education; and it may be conjectured that his comprehensive programme, which Prodicus and others extended, had something to do with the development of that versatility which was the most notable element in the Athenian character.

There is less to be said for the teachers of rhetoric, politics and eristic, who, in limiting themselves each to a single subject—the rhetoricians proper or forensic rhetoricians to one branch of oratory, the politicians or political rhetoricians to another, and the eristics to disputation—ceased to be educators and became instructors. Nevertheless, rhetoric and disputation, though at the present day strangely neglected in English schools and universities, are, within their limits, valuable instruments; and, as specialization in teaching does not necessarily imply specialization in learning, many of those who attended the lectures and the classes of a rhetorician or an eristic sought and found other instruction elsewhere. It would seem then that even in its decline sophistry had its educational use. But in any case it may be claimed for its professors that in the course of a century they discovered and turned to account most of the instruments of literary education.

With these considerable merits, normal sophistry had one defect, its indifference to truth. Despairing of philosophy—that is to say, of physical science—the sophists were prepared to go all lengths in scepticism. Accordingly the epideictic sophists in exposition, and the argumentative sophists in debate, one and all, studied, not matter but style, not accuracy but effect, not proof but persuasion. In short, in their hostility to science they refused to handle literature in a scientific spirit. That this defect was serious was dimly apprehended even by those who frequented and admired the lectures of the earlier sophists; that it was fatal was clearly seen by Socrates, who, himself commonly regarded as a sophist, emphatically reprehended, not only the taking of fees, which was after all a mere incident, objectionable because it seemed to preclude independence of thought, but also the fundamental disregard of truth which infected every part and every phase of sophistical teaching. To these contemporary censures the modern critic cannot refuse his assent.

To literature and to oratory the sophists rendered good service. Themselves of necessity stylists, because their professional success largely depended upon skilful and effective exposition, the sophists both of culture and of rhetoric were professedly teachers of the rules of grammar and the principles of written and spoken discourse. Thus, by example as well as by precept, they not only taught their hearers to value literary and oratorical excellence, but also took the lead in fashioning the style of their time. Their influence in these respects was weighty and important. Whereas, when sophistry began, prose composition was hardly practised in central Greece, the sophists were still the leaders in literature and oratory when Plato wrote the *Republic*, and they had hardly lost their position when Demosthenes delivered the *Philippics*. In fact, it is not too much to say that it was the sophists who provided those great masters with their consummate instrument, and it detracts but little from the merit of the makers if they were themselves unable to draw from it its finer tones.

The relation of sophistry to philosophy was throughout one of pronounced hostility. From the days of Protagoras, when this hostility was triumphant and contemptuous, to the days of Isocrates, when it was jealous and bitter, the sophists were declared and consistent sceptics. But, although Protagoras and Gorgias had examined the teaching of their predecessors so far as to satisfy themselves of its futility and to draw the sceptical inference, their study of the great problem of the day was preliminary to their sophistry rather than a part of it; and, as the overthrow of philosophy was complete and the attractions of sophistry were all-powerful, the question "What is knowledge?" ceased for a time to claim or to receive attention. There is, then, no such thing as a "sophistical theory of knowledge." Similarly, the recognition of a "sophistical ethic" is, to say the least, misleading. It may have been that the sophists' preference of seeming to reality, of success to truth, had a mischievous effect upon the morality of the time; but it is clear that they had no common theory of ethics, and there is no warrant for the assumption that a sophist, as such, specially interested himself in ethical questions. When Protagoras asserted "civic excellence" or "virtue" to be the end of education, he neither expressed nor implied a theory of morality. Prodicus in his platitudes reflected the customary morality of the time. Gorgias said plainly that he did not teach "virtue." If Hippias, Polus and Thrasymachus defied conventional morality, they did so independently of one another, and in this, as in other matters, they were disputants maintaining paradoxical theses, rather than thinkers announcing heretical convictions. The morality of Isocrates bore a certain resemblance to that of Socrates. In short, the attitude of the sophists towards inquiry in general precluded them, collectively and individually, from attachment to any particular theory. Yet among the so-called sophists there were two who had philosophical leanings, as appears in their willingness to be called by the title of philosopher. First, Socrates, whilst he conceived that the physicists had mistaken the field of inquiry, absolute truth being unattainable, maintained, as has been seen, that one opinion was better than another, and that consistency of opinion, resulting in consistency of action, was the end which the human intellect properly proposes to itself. Hence, though an agnostic, he was not unwilling to be called a philosopher, in so far as he pursued such truth as was attainable by man. Secondly, when sophistry had begun to fall into contempt, the political rhetorician Isocrates claimed for himself the time-honoured designation of philosopher, "herein," says Plato, "resembling some tinker, bald-pated and short of stature, who, having made money, knocks off his chains, goes to the bath, buys a new suit, and then takes advantage of the poverty and desolation of his master's daughter to urge upon her his odious addresses" (*Rep.* vi. 495 E). It will be seen, however, that neither Socrates nor Isocrates was philosopher in any strict sense of the word, the speculative aims of physicists and metaphysicians being foreign to the practical theories both of the one and of the other.

As for the classification of sophistical methods, so for their criticism, the testimony of Plato is all-important. It may be conjectured that, when he emerged from the purely Socratic phase of his earlier years, Plato gave himself to the study of contemporary methods of education and to the elaboration of an educational system of his own, and that it was in this way that he came to the metaphysical speculations of his maturity. It may be imagined further that, when he established himself at the Academy, his first care was to draw up a scheme of education, including arithmetic, geometry (plane and solid), astronomy, harmonics and dialectic, and that it was not until he had arranged for the carrying out of this programme that he devoted himself to the special functions of professor of philosophy. However this may be, we find amongst his writings—intermediate, as it would seem, between the Socratic conversations of his first period of literary activity and the metaphysical disquisitions of a later time—a series of dialogues which, however varied their ostensible subjects, agree in having a direct bearing upon education. Thus the *Protagoras* brings the educational theory of Protagoras and the sophists of culture face to face with the educational theory of Socrates, so as to expose the limitations of both; the *Gorgias* deals with the moral aspect of the teachings of the forensic rhetorician Gorgias and the political rhetorician Isocrates, and the intellectual aspect of their respective theories of education is handled in the *Phaedrus*; the *Meno* on the one hand exhibits the strength and the weakness of the teaching of Socrates, and on the other brings into view the makeshift method of those who, despising systematic teaching, regarded the practical politician as the true educator; the *Euthydemus* has for its subject the eristical method; finally, having in these dialogues characterized the current theories of education, Plato proceeds in the *Republic* to develop an original scheme. Plato's criticisms of the sophists are then, in the opinion of the present writer, no mere *obiter dicta*, introduced for purposes of literary adornment or dramatic effect, but rather the expressions of profound and reasoned conviction, and, as such, entitled at any rate to respect. For the details of Plato's critique the reader should go not to the summaries of commentators, but to the dialogues themselves. In this place it is sufficient to say that, while Plato accounts no education satisfactory which has not knowledge for its basis, he emphatically prefers the scepticism of Socrates, which, despairing of knowledge, seeks right opinion, to the scepticism of the sophists, which, despairing of knowledge, abandons the attempt to better existing beliefs.

3. *The Theory of Grote.*—The post-Platonic historians and critics, who, while they knew the earlier sophistry only through tradition, were eyewitnesses of the sophistry of the decadence, were more alive to the faults than to the virtues of the movement. Overlooking the differences which separated the humanists from the eristics, and both of these from the rhetoricians, and taking no account of Socrates, whom they regarded as a philosopher, they forgot the services which Protagoras and Prodicus, Gorgias and Isocrates had rendered to education and to literature, and included the whole profession in an indiscriminate and contemptuous censure. This prejudice, establishing itself in familiar speech, has descended from antiquity to modern times, colouring, when it does not distort, the narratives of biographers and the criticisms of commentators. "The sophists," says Grote, "are spoken of as a new class of men, or sometimes in language which implies a new doctrinal sect or school, as if they then sprang up in Greece for the first time—ostentatious impostors, flattering and duping the rich youth for their own personal gain, undermining the morality of Athens, public and private, and encouraging their pupils to the unscrupulous prosecution of ambition and cupidity. They are even affirmed to have succeeded in corrupting the general morality, so that Athens had become miserably degenerated and vicious in the latter years of the Peloponnesian War, as compared with what she was in the time of Miltiades and Aristeides;" and, although amongst the pre-Grotian scholars there were some who saw as clearly as Grote himself that "the sophists are a much-calumniated race" (G. H. Lewes), it is certain that historians of philosophy, and editors of Plato, especially the "acumen plumbeum Stallbaumii," had given ample occasion for the energetic protest contained in the famous sixty-seventh chapter of Grote's *History of Greece.* Amongst the many merits of that

admirable scholar, it is one of the greatest that he has laid "the fiend called *die Sophistik*," that is to say, the theory that sophistry was an organized conspiracy against law and morals. Nevertheless, in this matter he is always an advocate; and it may be thought that, while he successfully disposes of the current slander, his description of his clients needs correction in some important particulars. Hence the following paragraphs, while they will resume and affirm his principal results, will qualify and impugn some of his positions.

In so far as he is critical, Grote leaves little to be desired. That the persons styled sophists "were not a sect or school, with common doctrines or method," is clear. Common doctrine, that is to say, common doctrine of a positive sort, they could not have, because, being sceptics, they had nothing which could be called positive doctrine; while there was a period when even their scepticism was in no wise distinctive, because they shared it with all or nearly all their contemporaries. Neither were they united by a common educational method, the end and the instruments of education being diversely conceived by Protagoras, Gorgias and Isocrates, to say nothing of the wider differences which separate these three from the eristics, and all the four normal types from the abnormal type represented by Socrates.

Again, it is certain that the theoretical and practical morality of the sophists, regarded as a class, was "neither above nor below the standard of the age." The taking of fees, the pride of professional success, and the teaching of rhetoric are no proofs either of conscious charlatanism or of ingrained depravity. Indeed, we have evidence of sound, if conventional, principle in Prodicus's apologue of the "Choice of Heracles," and of honourable, though eccentric, practice in the story of Protagoras's treatment of defaulting pupils. But, above all, it is antecedently certain that defection from the ordinary standard of morality would have precluded the success which the sophists unquestionably sought and won. In fact, public opinion made the morality of the sophists, rather than the sophists the morality of public opinion. Hence, even if we demur to the judgment of Grote that "Athens at the close of the Peloponnesian War was not more corrupt than Athens in the days of Miltiades and Aristeides," we shall not "consider the sophists as the corrupters of Athenian morality," but rather with Plato lay the blame upon society itself, which, "in popular meetings, law courts, theatres, armies and other great gatherings, with uproarious censure and clamorous applause" (*Rep.* vi. 492), educates young and old, and fashions them according to its pleasure.

Nor can we regard "Plato and his followers as the authorized teachers of the Greek nation and the sophists as the dissenters." On the contrary, the sophists were in quiet possession of the field when Plato, returning to Athens, opened the rival school of the Academy; and, while their teaching in all respects accommodated itself to current opinion, his, in many matters, ran directly counter to it.

But if thus far Grote's protest against prevalent assumptions carries an immediate and unhesitating conviction, it may be doubted whether his positive statement can be accounted final. "The appearance of the sophists," he says, "was no new fact. . . . The paid teachers—whom modern writers set down as the sophists, and denounce as the modern pestilence of their age—were not distinguished in any marked or generic way from their predecessors." Now it is true that before 447 B.C., besides the teachers of writing, gymnastics and music, to whom the young Greek resorted for elementary instruction, there were artists and artisans who not only practised their crafts, but also communicated them to apprentices and pupils, and that accordingly the Platonic Protagoras recognizes in the gymnast Iccus, the physician Herodicus, and the musicians Agathocles and Pythoclides, forerunners of the sophists. But the forerunners of the sophists are not to be confounded with the sophists themselves, and the difference between them is not far to seek. Though some of those who resorted to the gymnasts, physicians and musicians derived from them such substitute for "higher education" as was before 447 generally obtainable, it was only incidentally that professional men and artists communicated anything which could be called by that name. Contrariwise, the sophists were always and essentially professors of the higher education; and, although in process of time specialization assimilated sophistry to the arts, at the outset at any rate, its declared aim—the cultivation of the civic character—sufficiently distinguished sophistical education both from professional instruction and from artistic training. It is true too that in some of the colonies philosophy had busied itself with higher education; but here again the forerunners of the sophists are easily distinguished from the sophists, since the sophists condemned not only the scientific speculations of their predecessors, but also their philosophical aims, and offered to the Greek world a new employment for leisure, a new intellectual ambition.

Nor is it altogether correct to say that "the persons styled sophists had no principles common to them all and distinguishing them from others." Various as were the phases through which sophistry passed between the middle of the 5th century and the middle of the 4th, the sophists—Socrates himself being no exception—had in their declared antagonism to philosophy a common characteristic; and, if in the interval, philosophical speculation being temporarily suspended, scepticism ceased for the time to be peculiar, at the outset, when Protagoras and Gorgias broke with the physicists, and in the sequel, when Plato raised the cry of "back to Parmenides," this common characteristic was distinctive.

Further, it may be doubted whether Grote is sufficiently careful to distinguish between the charges brought against the sophists personally and the criticism of their educational methods. When the sophists are represented as conscious imposters who "poisoned and demoralized by corrupt teaching the Athenian moral character," he has, as has been seen, an easy and complete reply. But the question still remains—Was the education provided by Protagoras, by Gorgias, by Isocrates, by the eristics and by Socrates, good, bad or indifferent? And, though the modern critic will not be prepared with Plato to deny the name of education to all teaching which is not based upon an ontology, it may nevertheless be thought that normal sophistry—as opposed to the sophistry of Socrates—was in various degrees unsatisfactory, in so far as it tacitly or confessedly ignored the "material" element of exposition by reasoning.

And if Grote overlooks important agreements he seems also to understate important differences. Regarding Protagoras, Gorgias and Isocrates as types of one and the same sophistry (pp. 487, 493, 495, 499, 544, 2nd ed.), and neglecting as slander or exaggeration all the evidence in regard to the sophistry of eristic (p. 540), he conceives that the sophists undertook "to educate young men so as to make them better qualified for statesmen or ministers," and that "that which stood most prominent in the teaching of Gorgias and the other sophists was, that they cultivated and improved the powers of public speaking in their pupils." Excellent as a statement of the aim and method of Isocrates, and tolerable as a statement of those of Gorgias, these phrases are inexact if applied to Protagoras, who, making "civic virtue" his aim, regarded statesmanship and administration as parts of "civic virtue", and consequently assigned to oratory no more than a subordinate place in his programme, while to the eristics—whose existence is attested not only by Plato, but also by Isocrates and Aristotle—and to Socrates—whom Grote himself accounts a sophist—the description is plainly and palpably inappropriate.

Grote's note about the eristical sophists is perhaps the least satisfactory part of his exposition. That "there were in Athens persons who abused the dialectical exercise for frivolous puzzles" he admits; but "to treat Euthydemus and Dionysodorus as samples of 'the Sophists' is," he continues, "altogether unwarrantable." It would seem, then, that, while he regards rhetoric as the function of normal sophistry, taking indifferently as his types Protagoras, Gorgias and Isocrates, he accounts Euthydemus and Dionysodorus (together with Socrates) as sophists, but as sophists of an abnormal sort, who may therefore be neglected. Now this view is inconsistent with the evidence of Plato, who, in the

Sophist, in his final and operative definition, gives prominence to the eristical element, and plainly accounts it the main characteristic not indeed of the sophistry of the 5th century, but of the sophistry of the 4th. It must be presumed, then, that, in virtue of his general suspicions of the Platonic testimony, Grote in this matter leaves the *Sophist* out of account. There is, however, another theory of the significance of Plato's allusions to eristical sophistry, that of Professor H. Sidgwick, whose brilliant defence of Grote is an indispensable supplement to the original document. Giving a hearty general assent to Grote's theory, Sidgwick nevertheless introduces qualifications similar to some of those which are suggested in this article. In particular he allows that "there was at any rate enough of charlatanism in Protagoras and Hippias to prevent any ardour for their historical reputation," that the sophists generally "had in their lifetime more success than they deserved," that it was "antagonism to their teaching which developed the genius of Socrates," and, above all, that, "in his anxiety to do justice to the Sophist, Grote laid more stress than is at all necessary on the partisanship of Plato." Now this last admission precludes Sidgwick from neglecting, as Grote had done, the evidence of the *Euthydemus*. Pointing out that the sophists of that dialogue "profess εἰς ἀρετῆς ἐπιμέλειαν προτρέψαι by means of dialogue," that "they challenge the interlocutor ὑπέχειν λόγον," that "their examples are drawn from common objects and vulgar trades," that "they maintain positions that we know to have been held by Megarians and Cynics," he infers that "what we have here presented to us as 'sophistic' is neither more nor less than a caricature of the Megarian logic"; and further, on the ground that "the whole conception of Socrates and his effect on his contemporaries, as all authorities combine to represent it, requires us to assume that his manner of discourse was quite novel, that no one before had systematically attempted to show men their ignorance of what they believed themselves to know," he is "disposed to think that the art of disputation which is ascribed to sophists in the *Euthydemus* and the *Sophistes* (and exhaustively analysed by Aristotle in the Περὶ σοφιστικῶν ἐλέγχων) originated entirely with Socrates, and that he is altogether responsible for the form at least of this second species of sophistic." To this theory the present writer is unable to subscribe. That Plato was not careful to distinguish the Megarians and the Cynics from the eristical sophists, and that the disputants of the 4th century affected some of the mannerisms of the greatest disputant of the 5th century, he willingly concedes. But he cannot allow either that the Megarians and the Cynics were the only eristics, or that eristical sophistry began with Socrates. Plainly this is not the place for a full examination of the question; yet it may be remarked—(1) that the previous history of the sophists of the *Euthydemus*, who had been professors of tactics (Xenophon, *Mem.* iii. 1, 1), swordsmanship, and forensic argumentation, implies that they came to eristic not from the sophistry of Socrates, but from that of the later humanists, polymaths of the type of Hippias; (2) that the fifth and sixth definitions of the *Sophist*, in which "that branch of eristic which brings pecuniary gain to the practitioner" is opposed to the "patience-trying, purgative elenchus" of Socrates, indicate that contemporary with Socrates there were eristics whose aims were not his; (3) that, whereas the sophist of the final definition "disputes, and teaches others to dispute, about things divine, cosmical, metaphysical, legal, political, technical, in fact, about all things," we have no ground for supposing that the Megarians and the Cynics used their eristic for any purpose except the defence of their logical heresies.

Nor is it possible to accept the statements that "the splendid genius, the lasting influence, and the reiterated polemics of Plato have stamped the name sophist upon the men against whom he wrote as if it were their recognized, legitimate and peculiar designation," and that "Plato not only stole the name out of general circulation, in order to fasten it specially upon his opponents the paid teachers, but also connected with it express discreditable attributes which formed no part of its primitive and recognized meaning and were altogether distinct from, though grafted upon, the vague sentiment of dislike associated with it." That is to say, Grote supposes that for at least eight and forty years, from 447 to 399, the paid professors had no professional title; that, this period having elapsed, a youthful opponent succeeded in fastening an uncomplimentary title not only upon the contemporary teachers, but also, retrospectively, upon their predecessors; and that, artfully enhancing the indignity of the title affixed, he thus obscured, perverted and effaced the records and the memories of the past. Manifestly all three propositions are antecedently improbable. But more than this: whereas in the nomenclature of Plato's contemporaries Protagoras, Gorgias, Socrates, Dionysodorus and Isocrates were all of them sophists, Plato himself, in his careful investigation summarized above, limits the meaning of the term so that it shall include the humanists and the eristics only. Now, if his use of the term was stricter than the customary use, he can hardly be held answerable for the latter.

Nor is Grote altogether just in his account of Plato's attitude towards the several sophists, or altogether judicious in his appreciation of Plato's testimony. However contemptuous in his portraiture of Hippias and Dionysodorus, however severe in his polemic against Isocrates, Plato regards Protagoras with admiration and Gorgias with respect. While he emphasizes in the later sophists the consequences of the fundamental error of sophistry—its indifference to truth—he does honour to the genius and the originality of the leaders of the movement. Indeed, the author of this article finds in the writings of Plato a grave and discriminating study of the several forms of sophistry, and no trace whatsoever of that blind hostility which should warrant us in neglecting his clear and precise evidence.

In a word, the present writer agrees with Grote that the sophists were not a sect or school with common doctrine or method; that their theoretical and practical morality was neither above nor below that of their age, being, in fact, determined by it; and that Plato and his followers are not to be regarded as the authorized teachers of the Greek nation, nor the sophists as the dissenters, but vice versa. At the same time, in opposition to Grote, he maintains that the appearance of the sophists marked a new departure, in so far as they were the first professors of "higher education" as such; that they agreed in the rejection of "philosophy"; that the education which they severally gave was open to criticism, inasmuch as, with the exception of Socrates, they attached too much importance to the form, too little to the matter, of their discourses and arguments; that humanism, rhetoric, politic and disputation were characteristic not of all sophists collectively, but of sections of the profession; that Plato was not the first to give a special meaning to the term "sophist" and to affix it upon the professors of education; and, finally, that Plato's evidence is in all essentials trustworthy.

Bibliography.—On the significance of the sophistical movement, see E. Zeller, *Philosophie d. Griechen*, i. 932–1041 (4th ed., Leipzig, 1876); *Presocratic Philosophy*, ii. 394–516 (London, 1881); G. Grote, *History of Greece*, ch. lxvii. (London, 1851, &c.); E. M. Cope, "On the Sophists," and "On the Sophistical Rhetoric," in *Journ. Class. and Sacr. Philol.* vol. ii. (Cambridge, 1855), and vol. iii. (1857), an erudite but inconclusive reply to Grote; H. Sidgwick, "The Sophists," in *Journ. of Philol.*, vol. iv. (Cambridge, 1872), and vol. v. (1874), a brilliant defence of Grote; A. W. Benn, *The Greek Philosophers* i. 53–107 (London, 1882). For lists of treatises upon the life and teaching of particular sophists, see Ueberweg, *Grundriss d. Gesch. d. Philos.*, i. §§ 27–32 (*History of Philosophy*, London, 1880). On the later use of the term "sophist," see Rhetoric. (H. Ja.)

SOPHOCLES (495–406 B.C.), Greek tragic poet, was born at Colonus in the neighbourhood of Athens. His father's name was Sophillus; and the family burial-place is said to have been about a mile and a half from the city on the Decelean Way. The date assigned for the poet's birth is in accordance with the tale that young Sophocles, then a pupil of the musician Lamprus, was chosen to lead the chorus of boys in the celebration of the victory of Salamis (480 B.C.). The time of his death is fixed by the allusions to it in the *Frogs* of Aristophanes and in the *Muses*, a lost play of Phrynichus, the comic poet, which were both produced in 405 B.C., shortly before the capture of Athens. And the legend which implies that Lysander allowed him funeral honours is one of those which, like the story of Alexander and Pindar's house at Thebes, we can at least wish to be founded on fact, though we should probably substitute Agis for Lysander. Apart from tragic victories, the event of Sophocles' life most fully authenticated is his appointment at the age of fifty-five as one of the generals who served with Pericles in the Samian War (440–439 B.C.). Conjecture has been rife as to the possibility of his here improving acquaintance with Herodotus, whom he probably met some years earlier at Athens. But the distich quoted by Plutarch—

Ὠιδὴν Ἡροδότῳ τεῦξεν Σοφοκλῆς ἐτέων ὢν
Πέντ' ἐπὶ πεντήκοντα—

is a slight ground on which to reject the stronger tradition according to which Herodotus was ere this established at Thurii;

and the coincidences in their writings may be accounted for by their having drawn from a common source. The fact of Sophocles' generalship is the less surprising if taken in connexion with the interesting remark of his biographer (whose *Life*, though absent from the earliest MS. through some mischance, bears marks of an Alexandrian origin) that he took his full share of civic duties, and even served on foreign embassies. The large acquaintanceship which this implies, not only in Athens, but in Ionic cities generally, is a point of main importance in considering the opportunities of information at his command. And, if we credit this assertion, we are the more at liberty to doubt the other statement, though it is not incredible, that his appointment as general was due to the political wisdom of his *Antigone*.

The testimony borne by Aristophanes in the *Frogs* to the amiability of the poet's temper (ὁ δ' εὔκολος μὲν ἐνθάδ', εὔκολος δ' ἐκεῖ) agrees with the record of his biographer that he was universally beloved. And the anecdote recalled by Cephalus in Plato's *Republic*, that Sophocles welcomed the release from the passions which is brought by age, accords with the spirit of his famous Ode to Love in the *Antigone*. The Sophocles who, according to Aristotle (*Rhet.* iii. 18), said of the government of the Four Hundred that it was the better of two bad alternatives (probably the same who was one of the *probuli*), may or may not have been the poet. Other gossiping stories are hardly worth repeating—as that Pericles rebuked his love of pleasure and thought him a bad general, though a good poet; that he humorously boasted of his own "generalship" in affairs of love; or that he said of Aeschylus that he was often right without knowing it, and that Euripides represented men as they are, not as they ought to be. (This last anecdote has the authority of Aristotle.) Such trifles rather reflect contemporary or subsequent impressions of a superficial kind than tell us anything about the man or the dramatist. The gibe of Aristophanes (*Pax* 695 seq.), that Sophocles in his old age was become a very Simonides in his love for gain, may turn on some perversion of fact, without being altogether fair to either poet. It is certainly irreconcilable with the remark (*Vit. anon.*) that in spite of pressing invitations he refused to leave Athens for kings' courts. And the story of his indictment by his son Iophon for incompetence to manage his affairs—to which Cicero has given some weight by quoting it in the *De senectute*—appears to be really traceable to Satyrus (fl. *c.* 200 B.C.), the same author who gave publicity to the most ridiculous of the various absurd accounts of the poet's death—that his breath failed him for want of a pause in reading some passage of the *Antigone*. Satyrus is at least the sole authority for the defence of the aged poet, who, after reciting passages from the *Oed. Col.*, is supposed to have said to his accusers, "If I am Sophocles I am no dotard, and if I dote I am not Sophocles." On the other hand, we need not the testimony of biographers to assure us that he was devoted to Athens and renowned for piety. He is said to have been priest of the hero Alcon, and himself to have received divine honours after death.

That the duty of managing the actors as well as of training the chorus belonged to the author is well known. But did Aeschylus act in his own plays? This certainly is implied in the tradition that Sophocles, because of the weakness of his voice, was the first poet who desisted from doing so. In his *Thamyras*, however, he is said to have performed on the lyre to admiration, and in his *Nausicaa* (perhaps as coryphaeus) to have played gracefully the game of ball. Various minor improvements in decoration and stage carpentry are attributed to him—whether truly or not who can tell? It is more interesting, if true, that he wrote his plays having certain actors in his eye; that he formed an association for the promotion of liberal culture; and that he was the first to introduce three actors on the stage. It is asserted on the authority of Aristoxenus that Sophocles was also the first to employ Phrygian melodies. And it is easy to believe that *Aj.* 693 seq., *Trach.* 205 seq., were sung to Phrygian music, though there are strains in Aeschylus (*e.g. Choeph.* 152 seq., 423 seq.) which it is hard to distinguish essentially from these. Ancient critics had also noted his familiarity with Homer, especially with the *Odyssey*, his power of selection and of extracting an exquisite grace from all he touched (whence he was named the "Attic Bee"), his mingled felicity and boldness, and, above all, his subtle delineation of human nature and feeling. They observed that the balanced proportions and fine articulation of his work are such that in a single half line or phrase he often conveys the impression of an entire character. Nor is this verdict of antiquity likely to be reversed by modern criticism.

His minor poems, elegies, paeans, &c., have all perished; and of his hundred and odd dramas only seven remain. These all belong to the period of his maturity (he had no decline); and not only the titles but some scanty fragments of more than ninety others have been preserved. Several of these were, of course, satyric dramas. And this recalls a point of some importance, which has been urged on the authority of Suïdas, who says that "Sophocles began the practice of pitting play against play, instead of the tetralogy." If it were meant that Sophocles did not exhibit tetralogies, this statement would have simply to be rejected. For the word of Suïdas (A.D. 950) has no weight against quotations from the lists of tragic victories (διδασκαλίαι), which there is no other reason for discrediting. It is distinctly asserted on the authority of the διδασκαλίαι that the *Bacchae* of Euripides, certainly as late as any play of Sophocles, was one of a trilogy or tetralogy. And if the custom was thus maintained for so long it was clearly impossible for any single competitor to break through it. But it seems probable that the trilogy had ceased to be the continuous development of one legend or cycle of legends—"presenting Thebes or Pelops' line"—if, indeed, it ever was so exclusively; and if a Sophoclean tetralogy was still linked together by some subtle bond of tragic thought or feeling, this would not affect the criticism of each play considered as an artistic whole. At the same time it appears that the satyric drama lost its grosser features and became more or less assimilated to the milder form of tragedy. And these changes, or something like them, may have given rise to the statement in Suïdas.

The small number of tragic victories attributed to Sophocles, in proportion to the number of his plays, is only intelligible on the supposition that the dramas were presented in groups.

If the diction of Sophocles sometimes reminds his readers of the *Odyssey*, the subjects of his plays were more frequently chosen from those later epics which subsequently came to be embodied in the epic cycle—such as the *Aethiopis*, the *Little Iliad*, the *Iliupersis*, the *Cypria*, the *Nosti*, the *Telegonia* (all revolving round the tale of Troy), the *Thebaica*, the Οἰχαλίας ἅλωσις, and others, including probably, though there is no mention of such a thing, some early version of the Argonautic story. In one or other of these heroic poems the legends of all the great cities of Hellas were by this time embodied; and though there must also have been a cloud of oral tradition floating over many a sacred spot, Sophocles does not seem, unless in his *Oedipus Coloneus*, to have directly drawn from this. He was content to quarry from the epic rhapsodies the materials for his more concentrated art, much as Shakespeare made use of Hollingshed or Plutarch, or as the subjects of Tennyson's *Idylls of the King* were taken from Sir Thomas Malory. As Sophocles has been accused of narrowing the range of tragic sympathy from Hellas to Athens, it deserves mention here that, of some hundred subjects of plays attributed to him, fifteen only are connected with Attica, while exactly the same number belong to the tale of Argos, twelve are Argonautic, and thirty Trojan. Even Corinthian heroes (Bellerophon, Polyidus) are not left out. It seems probable on the whole that, within the limits allowed by convention, Sophocles was guided simply by his instinctive perception of the tragic capabilities of a particular fable.

To say that subsidiary or collateral motives were never present to Sophocles in the selection of a subject would, however, be beyond the mark. His first drama, the *Triptolemus*, must have been full of local colouring; the *Ajax* appealed powerfully to the national pride; and in the *Oedipus Coloneus* some faint echoes even of oligarchical partisanship may be possibly discerned (see below). But, even where they existed, such motives *were* collateral and subsidiary; they were never primary. All else was subordinated to the dramatic, or, in other words, the purely human, interest of the fable This central interest is even more dominant and pervading in Sophocles than the otherwise supreme influence of religious and ethical ideas. The idea of destiny, for example, was of course inseparable from Greek tragedy. Its prevalence was one of the conditions which presided over the art from its birth, and, unlike Aeschylus, who wrestles with gods, Sophocles simply accepts it, both as a *datum* of tradition and a fact of life. But in the free handling of Sophocles even fate and providence are adminicular to tragic art. They are instruments through which sympathetic emotion is awakened, deepened, intensified. And, while the vision of the eternal and unwritten laws was holier yet, for it was not the creation of any former age, but rose and culminated with the Sophoclean drama, still to the poet and his Periclean audience this was no abstract notion, but was inseparable from their impassioned contemplation of the life of man—so great and yet so helpless, aiming so high and falling down so far, a plaything of the gods and yet essentially divine. This lofty vision subdued with the serenity of awe the terror and pity of the scene, but from neither could it take a single tremor or a single tear. Emotion was the element in which Greek tragedy lived and moved, albeit an emotion that was curbed to a serene stillness through its very depth and intensity.

The final estimate of Sophoclean tragedy must largely depend upon the mode in which his treatment of destiny is conceived. That Aeschylus had risen on the wings of faith to a height of prophetic vision, from whence he *saw* the triumph of equity and the defeat of wrong as an eternal process moving on toward one divine event—that he realized sin, retribution, responsibility as no other ancient did—may be gladly conceded. But it has been argued that because Sophocles is saddened by glancing down again at actual life—because in the fatalism of the old fables he finds the reflection of a truth—he in so far takes a step backward as a tragic artist. This remark is not altogether just. His value for what is highest in man is none the less because he strips it of earthly rewards, nor is his reverence for eternal law less deep because he knows that its workings are sometimes pitiless. Nor, once more, does he disbelieve in Providence, because experience has shown him that the end towards which the supreme powers lead forth mankind is still unseen. Not only the utter devotion of Antigone, but the lacerated innocence of Oedipus and Deianira, the tempted truth of Neoptolemus, the essential nobility of Ajax, leave an impress on the heart which is ineffaceable, and must elevate and purify while it remains. In one respect, however, it must be admitted that Sophocles is not before his age. There is an element of unrelieved vindictiveness, not merely inherent in the fables, but inseparable from the poet's handling of some themes, which is only too consistent with the temper of the "tyrant city." Aeschylus represents this with equal dramatic vividness, but he associates it not with heroism, but with crime.
